The whole amount of salt inspected on the Onondaga salt springs during the year 1856 was 5,968,810 bushels. This is about 120,000 bushels short of the inspection of 1855, but exceeds, however, that of any previous year, being 160,000 more bushels than were returned in 1854. In the ordinary course of events, considering the increase of population in the Western markets for Onondaga salt, and the additional facilities of transportation constantly brought into use, the inspection for 1856, according to the official Reports, ought to have reached 6,500,000 bushels. The two principal causes producing the deficiency may be found in a more stringent state of the money market during the whole season, and in the enhancement of the price of salt at the works—$1 40 per barrel in 1856 against $1 30 in 1855. The amount of salt actually manufactured in 1856, and either sold and shipped or remaining in original hands, is considerably in excess of the manufacture of any former year. The inspection indicates very accurately the amount of sales, as no more is inspected during the manufacturing season than what is required to fill orders. The arrivals of Onondaga salt at Oswego in 1856 were 3,483,987 bushels, against 3,039,593 in 1855—an increase of 444,394 bushels. The arrivals at Buffalo in 1856 were 1,081,767 bushels, against 1,947,938 in 1855—a decrease of 866,171 bushels. The arrivals at all the lake ports in 1856, compared with those in 1855, show a decrease of 241,778 bushels.

Saltpetre, or **Nitrate of Potash** (Ger. *Saltpeter*; Fr. *Nitre, Salpetre*; It. *Nitro, Salnitro*; Sp. *Nitro, Salitre*; Russ. *Senitra*; Lat. *Nitrum*; Arab. *Uhlir*; Hind. *Shoreh*), a salt well known in commerce, and of great importance. It may be regarded both as a natural and an artificial production; being found on the surface of the soil in many parts of India, Egypt, Italy, etc.; but in these and other places all that is known in commerce is obtained by an artificial process, or by lixiviating earth that has been formed into *nitre* beds. The saltpetre consumed in England is brought from Bengal in an impure state, but crystallized, in bags, each containing 164 lbs. Saltpetre forms the principal ingredient in the manufacture of gunpowder, and is used in various arts. It is also of great utility in the commerce of India, from its furnishing a large amount of dead weight for the shipping engaged in it. Saltpetre possesses considerable antiseptic power. That which is of the best quality and well refined is in long, transparent crystals; its taste is sharp, bitterish, and cooling; it flames much when thrown upon burning coals; it is very brittle; specific gravity, 1·933. It is not altered by exposure to the air.

Beckmann contends, in a long and elaborate dissertation (*Hist. of Invent.*), that the ancients were unacquainted with saltpetre, and that their *nitrum* was really an alkaline salt. But as saltpetre is produced

naturally in considerable quantities in Egypt, it is difficult to suppose that they could be entirely ignorant of it, though it would appear that they had confounded it with other things. It has been known in the East from a very early period. Beckmann concurs in opinion with those who believe that gunpowder was invented in India, and brought by the Saracens from Africa to the Europeans, who improved its manufacture, and made it available for warlike purposes.

The Mammoth Cave in Kentucky was used as a place for the manufacture of saltpetre during the war of 1812. The soil in the cave is thoroughly impregnated with saltpetre; but in consequence of the difficulty of transportation, the manufacture has been abandoned.

IMPORTS OF SALTPETRE INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence imported.	Crude.		Refined, or partly refined.	
	Pounds.	Value.	Pounds.	Value.

Salvage, as the term is now understood, is an allowance or compensation made to those by whose exertions ships or goods have been saved from the dangers of the seas, fire, pirates, or enemies.

The propriety and justice of making such an allowance must be obvious to every one. It was allowed by the laws of Rhodes, Oleron, and Wisby; and in this respect they have been followed by all modern maritime states. At common law, the party who has saved the goods of another from loss or any imminent peril has a *lien* upon them, and may retain them in his possession till payment of a reasonable salvage.

Salvage upon Losses by Perils of the Sea.—In fixing the rate of salvage, regard is usually had, not only to the labor and peril incurred by the salvors, but also to the situation in which they may happen to stand in respect of the property saved, to the promptitude and alacrity manifested by them, and to the value of the ship and cargo, as well as the degree of danger from which they were rescued. Sometimes as large a proportion as *a half* of the property saved has been allowed as salvage; and in others not more than *a tenth*.

Parties entitled to salvage are all those who have contributed to the safety, either by personal exertions or by summary sacrifice, provided it did not fall within the course of their regular duty to make the exertions or sacrifice. Thus neither the master nor seamen of the ship in danger have any title to it; nor have any passengers for any ordinary assistance they may give; but it is not the duty of passengers to remain on board in time of danger, nor to incur any responsibility by undertaking the management of the ship; and if by doing the one or the other they contribute to the safety of the ship, they may be entitled to salvage.

If, before the service is rendered, a bargain is made for the amount to be paid for the assistance, this amount settles the claim for salvage; so if two ships sail as consorts, as is customary with whaling ships, on the terms of rendering each other mutual assistance, neither can claim salvage for assistance rendered to the other.

All the officers and crew of a British ship are under obligations to assist ships in distress; they are, nevertheless, to receive salvage for their services, subject to the conditions expressed in the British statutes. The owners, also, of a ship which has saved another are, besides being remunerated for stores or other matters contributed, or injury done to their ship, entitled to salvage for the detention of their ship, the risk of vacating their insurance, etc.—*See* SHIPPING.

The salvage is to be paid by those who would have borne the loss had there been no assistance, in the proportion to the benefit they have received. If the ship was in the course of earning freight, the freight must contribute. The wearing apparel, etc., of the master and crew are not liable for salvage.

The subject of salvage was largely discussed in our courts in a case of recapture. The District Court of New York allowed as salvage one half the value of the ship. The Circuit Court reversed the decree, and denied all salvage. The Supreme Court of the United States corrected both decrees, and allowed one sixth part of the net value, after deducting the charges. The court in that case admitted the rule to be, that a neutral vessel, captured by a belligerent, was entitled to be discharged without paying salvage, on the ground that no beneficial service was thereby rendered, as the neutral, acting properly, would of course be discharged by the courts of the sovereign of the captor; and they admitted likewise the exception to the rule when belligerent captors and courts were notorious for their unprincipled rapacity. This rule and the exception have been frequently declared in the English admiralty. The rule of British jurisprudence in respect to recaptured property of British subjects to allies, until it appears that they act upon a less liberal principle, and then the allies are treated according to their own measure of justice. The same rule has been adopted by statute in this country, and is founded on the immovable basis of reciprocal justice. Though the contract of seamen be not dissolved by shipwreck, and it be their duty to remain and labor to preserve the wreck and fragments of the ship and cargo, yet they may be entitled to recompense, by way of salvage, for their peculiar services. The wages recovered in the case of shipwreck are in the nature of salvage, and form a lien on the property saved. The character of seamen creates no incapacity to assume that of salvors; and were it otherwise, it would be mischievous to the interests of commerce, inconsistent with natural equity, and would be tempting the unfortunate mariner to obtain by plunder and embezzlement, in a common calamity, what he ought to possess upon principles of justice. The allowance of salvage in such cases is and ought to be liberal; not less, in any case, than the wages would have amounted to; and even an additional recompense should be made in cases of extraordinary danger and distinguished gallantry, when the service was much enhanced by the preservation of life, and the great value of the property at stake.—KENT'S *Commentaries*, vol. iii.—*See* INSURANCE.

Sample, a small quantity of a commodity exhibited at public or private sales, as a specimen. Sugars, wool, spirits, wine, coffee, and indeed most species of merchandise, are sold by sample. If an article be not, at an average, equal to the sample by which it is sold, the buyer may cancel the contract, and return the article to the seller.

Sandal-wood, the wood of a tree (*Santalum album*, Linn.) having somewhat the appearance of a large myrtle. It is of a deep yellow color, and yields an agreeable perfume. The tree, when cut down, is usually about nine inches in diameter at the root, but sometimes considerably more. After being felled, it is barked, cut into billets, and buried in a dry place for about a couple of months, during which time the white ants eat off the outer wood, without touching the heart, which is the sandal. It is then taken up and sorted, according to the size of the billets. The deeper the

color, and the nearer the root, the higher is the perfume. Reject such pieces as are of a pale color, small, decayed, or have white wood about them; and take especial care that it be not mixed with wood resembling sandal, but without its perfume. — MILBURN'S *Orient. Commerce.*

Sandal-wood is extensively employed by the Hindoos as a perfume in their funeral cerem[illegible]. But the Chinese are its principal consumers. [illegible] manufacture it into fans, and small articles of furniture, and use it, when ground into powder, as a cosmetic. During the year ending the 31st of December, 1848, there were imported by British vessels into Canton 20,732 piculs of sandal-wood, valued at $207,400; and the imports in some years are more than twice this amount. The average importation into Calcutta is about 200 tons a year. It grows principally in Malabar, in the mountainous country at a little distance from the low sea-coast; in Timor; and in the Fejee Islands in the South Sea. Calcutta is principally supplied from Malabar, while China derives the larger portion of her supplies from Timor and the other islands. It is seldom brought to Europe, except by individuals for their own use, or as presents for their friends.—BELL'S *External Comm. of Bengal;* CRAWFURD'S *Indian Archipelago.*

Sandals, a species of slippers worn by the ancient Jews, Greeks, and Romans. They consisted of a sole with a hollow part at one extreme, to embrace the ankle and leave the upper part of the foot bare. Originally sandals were made of leather; but they afterward became articles of great luxury, being made of gold, silver, or other precious stuff, and most beautifully ornamented.

Sandarach, a resinous substance, commonly met with in loose granules a little larger than a pea, of a whitish yellow color, brittle, inflammable, of a resinous smell, and acrid, aromatic taste. It exudes, it is said, in warm climates, from cracks and incisions in the common juniper bush. It is used as a varnish, dissolved in spirits of wine.—AINSLIE'S *Mat. Indica.*

San Domingo. The old Spanish part of the island of San Domingo, or the Dominican Republic, embraces the territory as settled by the treaty of limits between Spain and France in 1777. According to those limits, its area would comprise about two-thirds of the whole island, or over 18,000 square miles. The population of the republic reaches about 126,500 souls, composed of Spaniards, creoles, and blacks. The population, however, is stated by some authorities to exceed 250,000; but this is probably too large. The natural productions of the republic are all kinds of valuable wood, copper, iron, salt, coal, etc. Its soil is very fertile, but its climate is unhealthy, and at certain seasons exceedingly fatal to foreigners. The chief staples of the republic are mahogany, lignum-vitæ, dye-woods, tobacco, honey, and hides. The imports from the United States consist of assorted cargoes, flour, etc.; but most usually our vessels enter the ports of the republic in ballast.

The tariff of duties is based upon a fixed value assigned to each class of merchandise, on which a duty of 25 per cent. is levied. The general scope of these duties may be illustrated by selecting from the latest tariff the article of flour. The tariff valuation of this article is $5 per barrel of from 175 to 200 lbs.; the duty on which, at 25 per cent., would be $1 25. These duties are permanent (so long as the tariff continues unaltered), and are in no manner dependent on the fluctuation of prices. The tonnage duty on American vessels is $1 per ton in port, and 50 cents per ton for the coast, being 50 per cent. more than is charged on the vessels of such nations as have recognized the independence of the republic, or have entered into treaties with its government. The effect of this, as well as of other discriminations against the American flag, has been to give to the flags of treaty nations, especially to that of Great Britain, a large share of the carrying trade between the United States and the Dominican Republic. In 1854 a treaty of amity, commerce, and navigation was agreed upon and executed by plenipotentiaries of the two governments duly appointed for that purpose; but, objections being made to some of its stipulations by the Dominican Legislature, it was not confirmed. An amendment, defining the rights of Dominican citizens in the United States, was proposed, to which the commissioner of the United States objected, and thus the matter is understood to stand at the present time. The following tabular statements exhibit the trade and navigation of the Dominican Republic during a period of four years, ending with 1852, together with an analysis of the trade and navigation of each of the ports, San Domingo and Porto Plata, during the year last designated:

The following is a summary of the trade between the United States and the port of San Domingo during the last six months of 1854, viz.:

Number of vessels entered and cleared 28, with an

aggregate of 2520 tons; of these, four entered in ballast, and ten with assorted cargoes. The homeward cargoes consisted of mahogany, lignum-vitæ, hides, and honey, and amounted in value to $26,270. During the same period there entered six vessels under British colors, measuring in all 518 tons: one French vessel of 139 tons; one Danish of 125 tons, and one Dominican of 68 tons; total number of foreign vessels (exclusive of American) nine, with an aggregate tonnage of 850 tons. During the first six months of 1855 there entered and cleared 40 vessels from the United States (under the American flag), measuring in the aggregate 3375 tons; of these, 13 entered in ballast, and 7 with assorted cargoes, including one laden in part with flour. Value of cargoes, inward, $27,650; value of cargoes, homeward, $44,664. Homeward cargoes consisted of mahogany, lignum-vitæ, satin-wood, fustic, hides, and honey.

The commerce of San Domingo with the United States for the year 1857 was as follows:

Exports to San Domingo	$44,349
Imports from San Domingo	109,874
Tonnage cleared from United States—American	1920
" " " Foreign	918
Total	2838

The latest revision of the Dominican tariff bears date 18th June, 1853. The valuation of several articles, including domestic cottons, boys' shoes, etc., has been reduced; while in a few others, including women's shoes, there is an increase—on the latter article from $7 to $8 per dozen, which will raise the duty from $1 75 to $2 per dozen. The financial and political difficulties now experienced in the Dominican Republic can hardly fail to be felt in the general movements of its foreign commerce.

The reader is referred to the *article* HAYTI for the comparative statement of the commerce of the United States with the island of San Domingo—embracing the empire of Hayti and the Dominican Republic—exhibiting the value of exports to and imports from each country, and the tonnage of American and foreign vessels arriving from and departing to each country, during the years designated.

A Dominican vessel arriving in the United States from a port in the Dominican Republic is liable to a tonnage duty of $1 per ton, that being the duty imposed on the tonnage of vessels of the United States arriving in said republic; but the cargo is not liable to a discriminating duty of 10 per cent., no such duty being levied by the Dominican Republic on the cargoes of United States vessels arriving in the ports of that republic. — *See* HAYTI. For Political Relations of England with San Domingo, *see* FRASER'S *Mag.* xlii. 133; same article, *Living Age*, xxvii. 126; *Edinburgh Review*, xvii. 372.

Sandwich Islands. A group of eleven islands in the Pacific Ocean. They were discovered by Captain Cook in 1778. Many voyagers report that the natural capacity of the natives seems in no respect below the common standard of mankind. It was in one of these islands that this illustrious circumnavigator fell a victim to the sudden resentment of the natives, Feb. 14, 1779. Tamehameha, chief of Hawaii, becomes king of the group, 1800. Rihoriho, his son, succeeds him, 1819. Idolatry abolished, 1819. Rihoriho and his queen died in England, 1824. Kanikeaouli, 20 years of age, king, 1824. Mission established by the American Board, 1820. In 1832 there were 900 schools and 50,000 pupils in the islands. Treaty with the French, made with admiral Dupetit-Thouars, 1837. Another, enforcing the introduction of Catholic missionaries, etc., 1839. Tamehamcha III. becomes king, Dr. G. P. Judd, an American, prime minister. In 1831 there were 14 ships, 2630 tons, belonging to the islands—which are important to the United States as a whaling station.

This remote but interesting group is situated in the midst of the Pacific Ocean, in about lat. 21° N., and long. 157° W. It comprises eight inhabited and four uninhabited islands, Owhyhee, where Captain Cook was killed, being the most considerable. They are of volcanic formation, and mountainous, some of the peaks rising in Owhyhee to between 13,000 and 14,000 feet in height! The population in 1847 is said to have amounted to above 112,000, of which nearly 40,000 belonged to Owhyhee. But it is a curious fact that the native population has been rapidly decreasing for some years past, and does not now probably exceed a third part of its amount at the epoch of their discovery. The islanders are honorably distinguished among the Polynesian nations by the advances they have made in civilization; and particularly by their progress in manufactures, navigation, and commerce. Christianity was introduced by the American missionaries in 1820, and is now the religion of the state; schools have been established, churches have been built, and the forms of religion are pretty well observed. European usages have become fashionable; and the costume of the better classes, women as well as men, closely resembles that of the Americans.

The following table exhibits the population of the principal islands, according to the census of December, 1853:

Islands.	Natives.	Foreigners	Total
Hawaii	24,193	259	24,452
Maui	17,420	244	17,664
Molokai	3,565	42	3,607
Lanai	509	....	509
Oahu	17,815	1311	19,126
Kauai	6,726	264	6,990
Niihau	796	....	790
Total	71,108	2120	73,228

The staple exports of the islands are: Sugar, molasses, sirup, coffee, goat-skins, sweet potatoes, wool, hides, salt, tallow, beef, pulu,* and arrow-root. Agriculture has made but little progress, and will never, probably, occupy the natives to any great extent. There are many excellent tracts suitable for the production of coffee, wheat, vines, etc.; but the means of subsistence are so easily procured, that the inhabitants have but few inducements, even did they not lack the industry and enterprise, to become extensive agriculturists.

There are large tracts of good grazing land scattered throughout the island, and the growth of cattle is a leading, perhaps the most profitable, branch of agricultural industry. There are also numerous sheep ranges, on which are tended about 12,000 sheep; but the business is not encouraging.

The eminently advantageous position of the Sandwich Islands, lying on the great route between America and China, invited at an early period the enterprise and capital of several European and American settlers, and led to the establishment of a somewhat active trade. They constitute a common centre between the three principal whaling grounds of the Northern Pacific—one on the equator, the other near Japan, and the third toward the Behring Sea.

The principal port is Honolulu, on the south side of the island of Woahoo, in lat. 21° 18′ 8″ N., long. 157° 55′ W. Population about 8500, of whom about 1200 are Englishmen, Americans, and other foreigners. The harbor, to which the place owes all its importance, has a narrow entrance, but it is easy of access at all times of the tide to vessels not drawing more than 18 feet water. The bar at its mouth being narrow, and composed of soft coral, it might easily be made accessible even for line-of-battle ships.

Commercial relations between the United States and the Sandwich Islands had existed for many years before the treaty of 1849. As far back as 1832, when the native population of the islands amounted to 130,315 (nearly double its present number), it appears that the

soon after introduced into Europe, but it is doubtful whether this were done by the Arabians or Greeks. The mode of fabricating paper from cotton and other vegetable materials being once discovered, its fabrication from linen rags was a comparatively easy, and in Europe, where cotton was then extremely scarce, an all but necessary step. It is singular, however, that we have no positive information either as to the country where, or the epoch when, paper from rags began to be manufactured in Europe. *Mais on ne peut reculer son invention plus tard, qu'au Treizieme siecle, ni son usage ordinaire au-delà du Quatorzième. — Nouveau Traité*, etc., i. 524. In fact, Egyptian paper, or paper made of papyrus in the manner described above, continued to be partially employed down to the middle of the eleventh century, though parchment was then the principal material used in writing. It is curious to observe how very shortly the introduction of paper preceded the invention of printing, to which, indeed, as already seen, it was an indispensable preliminary. Muratori attributes the ignorance of the barbarous ages principally to the scarcity and high price of paper, and the superior intelligence of modern times to its abundance and cheapness. — Andres, i. 200. And whatever opinion may be entertained as to the first part of this statement, there can be no question that the latter is perfectly well founded.

Not only are we in the dark as to the history of modern paper, but we are unable to make any very satisfactory conjectural estimate of the mode in which it was invented. It is all but certain that the invention must have been suggested by accident, or by observing the effects produced by the accidental drying of triturated vegetable matter, or in some such way; and that the hint thus afforded was gradually improved upon. It is not possible to imagine that the invention should have been wholly the result of design; for we can not conceive how any one without any previous knowledge should have proposed to himself to produce paper by pounding rags, or other vegetable matter, mixing the mass in water, and then pressing and drying the deposit. But, without indulging in unprofitable conjectures, it is at all events certain that, however and by whomsoever discovered, no invention has been of greater importance. *Chartæ usu maxime humanitas vitæ constet et memoria.* — Pliny, *Hist. Nat.* lib. xiii. cap. 11. The processes by which the most worthless and vilest materials are converted into such admirable substances as paper and glass are probably the greatest triumphs of human talent and ingenuity. They have more than realized the dreams of the alchemists, and have been incomparably more advantageous than if we had become acquainted with a means of transmuting the inferior metals into gold.

In 1813, Dr. Colquhoun estimated the value of paper annually produced in Great Britain at £2,000,000; but Mr. Stevenson, an incomparably better authority upon such subjects, estimated it at only half this sum. From information obtained from those engaged in the trade, we incline to think that the total annual value of the paper manufactured in the United Kingdom, exclusive of the duty, may at present amount to about £1,600,000 or £1,700,000. There are about 700 paper-mills in England, and from 70 to 80 in Scotland. The number in Ireland is but inconsiderable. Of these mills, we believe, very few have lately been unemployed. It was formerly customary to collect the rags used in the manufacture into large heaps, in order that, by their heating and fermentation, they might be the more easily reduced to filaments. But this injured the rags; and it is now the practice to tear them to pieces, without any such preparation, by powerful machines constructed for the purpose. During the present century this manufacture has been signally promoted by the combined influence of science, ingenuity, and mechanical skill. These have been successfully exerted in the preparation of the pulp; the conversion of the pulp into paper, and the provision of materials; and in none has their influence been more remarkable than in the last. This is evident from the fact that, while the manufacture has been more than doubled since 1820, the demand for Continental rags and other foreign materials has actually been reduced within that time, in consequence of the immense home supply we derive from substances previously regarded as worthless, and treated as refuse. The sweepings of cotton and flax mills, owing to the grease and dirt with which they are mixed up, were, until within these few years, of no value whatever, except as manure. The chemical and mechanical processes by which these materials are purified, whitened, and made available for the production of paper, without their strength being impaired, are not only exceedingly interesting in themselves, but are of great national importance; and, by reducing the cost of paper, have done ten times more to lower the price of books, and diffuse literature, than all the efforts of all the societies that ever existed.

The first idea of a machine for converting pulp into paper originated in France, the inventor being an ingenious workman of the name of Louis Robert. A model of this machine was brought to England by M. Leger Didot; and though at first it was far from giving an assurance of success, it sufficed to induce English capitalists and engineers, particularly Mr. Donkin, to follow up the scheme; and in the course of a few years they brought it to a high degree of perfection.

The following tabular statement exhibits the aggregate quantities, values, and prices per pound of rags imported into the United States from all countries, distinguishing in a separate column the quantities received from Italy during a period of ten consecutive years, from 1846 to 1855:

Years.	Rags imported from all Countries	Rags imported from Italy.	Aggregate Values.	Price per Pound.
	Pounds	Pounds.	Dollars.	Cents.
1846.....	9,897,706	8,002,865	385 020	8·89
1847.....	8,154 886	6,529,284	304,177	3·73
1848.....	17,014,587	13,803,036	626 136	3·68
1849.....	14,941,286	11,000,608	524 437	2·51
1850.....	20,696,875	15,861,266	747,157	3·01
1851.....	26,094,701	18,512,673	902,876	3·46
1852.....	18,288,458	12,280,570	622,576	3 42
1853.....	22,760,000	14,171,292	985,465	4·31
1854.....	32,015,753	24,240,999	1,007,826	3·0
1855.....	40,018,516	23,948,812	1,224 413	3 06
Aggregate....	206,883,718	148,300,155	$7,928,721	
Ann. average .	20,688,371	14,830,015	792,872	

From the preceding table it will be seen that during the decennial period ending with 1855 the aggregate quantity of rags imported into the United States from all parts was 206,631,954 lbs., while the aggregate quantity received from Italy reached as high as 148,300,155 lbs. The annual average for the period designated will, however, furnish a more statistical basis for ascertaining the relative importance of Italy compared with all other countries as the principal source of supply upon which the United States must rely, with any degree of certainty, for an article the consumption of which is so rapidly increasing there; even during the past year, an alarming deficiency of the manufactured material was seriously apprehended by the conductors of our periodical and newspaper journals. The average annual quantity imported into the United States from all countries during the period designated was 20,988,371 lbs.; the average annual quantity received from Italy was 14,830,015 lbs. Thus it is shown that instead of one-fifth Italy actually furnishes nearly two-thirds of all the rags imported into the United States.—*See* Rags.

The consumption of paper in the United States is equal to that of France and England combined. In other words, the 28,000,000 inhabitants of the United States consume as much paper as the 64,000,000 inhabitants of France and England. This is very near-

ly correct. The statistics, however, will prove interesting. The number of paper-mills in operation in England in 1685 was 750, and the annual value of the paper manufactured reached as high as $6,000,000. At that period, however, the manufacture of paper was burdened with an excise duty amounting to more than three times as much as the total wages of the hands employed in making it, and the quantity annually produced did not exceed 50,000,000 lbs. of first-class and 16,000,000 lbs. of second-class paper, requiring a supply of about 100,000,000 lbs. of rags.

Improvements in machinery and mode of manufacture, and the application of steam, have reduced the number of mills in Great Britain and Ireland to 380, according to the latest statistical returns; while the quantity of rags annually consumed has risen to 201,600,000 lbs., or over 100 per cent. We have compiled from a recent, though in this country a rare Dublin publication on statistics, the following tabular statement, showing the quantity of paper manufactured, consumed, and exported in Great Britain for a period of nine years, ending with 1854:

COMPARATIVE STATEMENT SHOWING THE QUANTITIES OF PAPER MANUFACTURED, CONSUMED, AND EXPORTED IN GREAT BRITAIN FROM 1846 TO 1854.

Years.	Pounds of Paper manufactured in Great Britain.	Pounds of Paper retained for Consumption in Great Britain.	Pounds of Paper exported from Great Britain
1846	127,400,000	122,600,000	4,836,000
1847	121,900,000	116,190,000	5,852,030
1848	121,800,000	116,600,000	5,180,000
1849	132,100,000	126,100,000	5,966,000
1850	141,000,000	133 200,000	7,762,000
1851	160,900,000	142,570,000	8,305,000
1852	154,400,000	147,100,000	7,228,000
1853	177,600,000	164,300,000	13,296,000
1854	177,800,000	161,700,000	16,112,000

France turns into paper annually about 235,200,000 lbs. of rags, producing about 156,800,000 lbs. of paper. In the United States there are 750 paper-mills, which work up each year about 405,000,000 lbs. of rags. Assuming (the usual estimate) that 1½ lb. of rags yields 1 lb. of paper, we have the following comparative statement for the United States, and France and Great Britain combined:

	Pounds of Rags annually consumed.	Pounds of Paper annually manufactured.	Pounds of Paper per Capita.
United States	405,000,000	270,000,000	10·80
Great Britain and France combined	436,800,000	291,200,000	4·55

From this statement it appears that the United States consumes 31,800,000 lbs. of rags, and manufactures 21,200,000 lbs. of paper, less than Great Britain and France combined, while the quantity of paper manufactured *per capita* of the population of the former is more than double that assigned to the combined population of the two latter. The quantity of paper imported in Great Britain and France and added to the stock for consumption might vary slightly, but not materially, the above results. The preceding statement, however, omits the quantities annually imported and exported by each of the countries respectively, items without which no calculation as to consumption can be accurately made. The importation of paper of all kinds into France in 1858 did not exceed 337,104 lbs., while the exports amounted to 17,058,657 lbs. This gives an excess of exports over imports to be supplied from the stock of domestic manufacture, of 16,716,553 lbs. Deduct this from 156,800,000 lbs., the quantity manufactured, and we have left for consumption 140,083,447 lbs., or 3·89 lbs. *per capita* of the population.

During the same year there were imported into England, according to the Report on Trade and Navigation, 909,250 lbs. of paper. The report gives this quantity for the last six months of the year only; assuming that the importation during the first six months was equal to that for the last as above given, and the total importation would reach, say 200,000 lbs. The quantity exported, we have seen, was 13,296,874 lbs., leaving an excess of exports over imports of 13,696,874 lbs. Recent and important improvements have been made, by the use of refuse tanned leather, bark of the cotton-stalk, pulp from the fibres of endogenous plants, as raw materials for the manufacture of paper.—*Scientific Ann.*

EXPORTS OF PAPER AND STATIONERY OF DOMESTIC MANUFACTURE FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1856.

Paper Boxes.—The manufacture of boxes from paper, or rather pasteboard, has become a very large one, from the custom of so many manufacturers selling their goods in these boxes. It is said that in Paris four thousand persons are employed in this trade alone. The trade is divided into six branches. The first comprises the most elaborately-finished and ornamented boxes, for the display of artificial flowers, rich velvets, ribbons, silks, trimmings, medals, miniatures, and corbeilles for wedding presents. The second class consists of boxes and small ornaments for confectioners. The third kind are used for packing toys and trinkets of small size. The fourth kind are for perfumery, fans, gloves, etc. The fifth comprises large boxes for shawls and ribbons for exportation. The sixth are pill-boxes, wafer-boxes, and others of the smallest kind. The French productions in this department of manufactures are superior to any other in neatness of execution and taste of ornamentation.

Chinese Paper.—The Chinese make a filamentous kind of paper much superior to ancient papyrus; it obtains in England the name of rice-paper; but sufficient is now known of it to show that this is by no means a correct designation. Dr. Livingstone introduced Chinese rice-paper in England about half a century ago; it had great favor as a material for artificial flowers. It was many years afterward that information was obtained concerning the mode adopted by the Chinese in making these small but very expensive sheets of paper. There is a leguminous plant growing in China and India, the stem of which is cut into pieces eight or ten inches in length; and these are cut by the Chinese into one continuous spiral film, on the same principle as the modern mode of veneer cutting, but by the dexterous use of hand-tools. These laminæ, being spread out and pressed flat, form thin sheets, which, after being dyed and otherwise prepared, constitute the rice-paper of the Chinese.

The same ingenious people make paper of bamboo. The bamboo stems, when about three or four inches thick, are cut into pieces four or five inches long. These, when softened in water, are washed, cut into filaments, dried and bleached in the sun, boiled, beaten to a pulp, and made into thin sheets of paper. This is truly paper, which the former examples are not; and the art must have made a considerable advance before such a method could have suggested itself.

Paper-hangings.—Stamped paper for this purpose was first made in Spain and Holland about A.D. 1555. Made of velvet and floss for hanging apartments, about 1620. The manufacture of this kind of paper rapidly improved in Great Britain from early in the eighteenth century; and it has now been brought to great perfection. Since this important and elegant substitute for the ancient "hangings" of tapestry or cloth came into use about 200 years ago, the manufacture has undergone a gradual succession of improvements, and has now reached a high state of beauty and perfection. The patterns on these papers are sometimes produced by stencil plates, but more commonly by blocks, each color being laid on by a separate block cut in wood or metal upon a plain or tinted ground. The patterns are sometimes printed in varnish or size, and gilt or copper leaf applied; or bisulphuret of tin (*aurum musivum*) is dusted over so as to adhere to the pattern; and in what are called *flock papers*, dyed wools minced into powder are similarly applied. Powdered steatite, or French chalk, is used to produce the peculiar gloss known under the name of *satin*. Striped papers are sometimes made by passing the paper rapidly under a trough, which has parallel slits in its bottom through which the color is delivered; and a number of other very ingenious and beautiful contrivances have lately been applied in this important branch of art. The invention of the paper machine, by which any length of paper may be obtained, effected a great change in paper-hangings, which could formerly only be printed upon separate sheets, and were much more inconvenient to print as well as to apply to the walls.

Papier-mache, a name given to articles manufactured of the pulp of paper, or of old paper ground up into a pulp, bleached, if necessary, and moulded into various forms. This article has lately been used upon an extensive scale for the manufacture of mouldings, rosettes, and other architectural ornaments; pilasters, capitals, and even figures as large as life, have also been made of it. It is lighter, more durable, and less brittle and liable to damage than plaster, and admits of being colored, gilt, or otherwise ornamented. Another article sometimes goes under the same name which is more like pasteboard, consisting of sheets of paper pasted or glued and powerfully pressed together, so as to acquire, when dry, the hardness of board, and yet to admit, while moist, of curvature and flexure: tea-trays, waiters, snuff-boxes, and similar articles are thus prepared, and afterward carefully covered by Japan or other varnishes, and often beautifully ornamented by figures or landscapes and other devices, etc., occasionally inlaid with mother of pearl. A mixture of sulphate of iron, quicklime, and glue, or white of egg, with the pulp for papier-mache, renders it to a greater extent water-proof; and the further addition of borax and phosphate of soda contributes to make it almost fire-proof. The chief papier-mache manufactory in England is that of Bielefeld, in Wellington Street, Strand, who has recently published a concise history of the manufacture, embellished with numerous illustrations. There are manufactories of papier-mache goods now established in Massachusetts. For the imports of articles of papier-mache, *see* PAPER.

Para, or **Belem**, a sea-port city of Brazil, capital of the province, 70 miles from the Atlantic, latitude of Fort St. Pedro 1° 28′ S., long. 48° 30′ 5″ W. Population estimated at 10,000, mostly of European descent. It stands on elevated ground, on the south shore of the Bay of Guajuara, on the right bank of the Para, or Tocantins, and has a fine appearance from the river. Chief edifices, the governor's palace, cathedral, several other churches, convents, barracks, arsenal, episcopal palace and seminary, formerly a Jesuits' college; a prison, and an unfinished theatre. Vessels of large draft can lie near the city, and the cocoa, caoutchouc, isinglass, rice, and drugs, exported from Brazil are chiefly from Para. It has also a trade in cotton, vanilla, annatto, dye-woods, honey, wax, and a great variety of other vegetable and animal products. The trade is mostly with Liverpool, London, Barbadoes, Cayenne, and the North American and other Brazilian ports. The River Para, bounding the island of Marajo southward, extends between long. 48° 10′ and 50° 40′ W., receives the Tocantins and Annapu from the south, and is connected northwestward with the Amazon.

Para enjoys an advantage possessed by no other seaport town in Brazil—that of an unobstructed intercourse by water with the interior. The commercial resources of this province, and the admirable trading position of the city, are unsurpassed; but inhabitants are wanting to develop these elements of commerce and civilization. In 1840, some American citizens established several saw-mills at Maguery, in the vicinity of Para; but whether they met with better success than did the Glasgow merchants, whose property to the amount of $350,000 was pillaged in the same place during a revolt in 1835, has not been ascertained. The cotton of Para has been highly prized. Caoutchouc, the use of which was first discovered in 1735 by French academicians sent to Brazil to make astronomical observations, is abundant, and is extensively manufactured into shoes, etc. Were this article admitted into the United States, as in England, free of duty, it would become one of the staple exports to this country. A well-informed American merchant, residing at Para, addressed a letter on this subject to one of the officers of Lieutenant Herndon's expedition to the Amazon,

urging the disadvantages under which American commerce labors, as compared with that of Great Britain, in the caoutchouc trade.—*See* "Letter from the Secretary of the Treasury, transmitting copy of circular letter and replies thereto, in reference to the Tariff, March 8, 1854." This article is now becoming the chief staple of the province of Para; and so various and multiform are the uses to which it is applicable, both in the arts and in domestic economy—so important as an article of commerce has it already become, that, even against the import duty of 10 per cent. in the United States, it constitutes almost 50 per cent. of our trade with Para. The following statement exhibits the quantities of India-rubber imported from Para into the United States during the years designated:

	Pounds.	Value.
1850	1,500,000	....
1854	3,830,000	....
1855	2,740,000	$1,660,000

The exports from Para to foreign countries consist of caoutchouc, cotton, rice, castor-oil, copaiva, aniseseed oil, cocoa, cloves, cinnamon, hides, horns, isinglass, Peruvian bark, etc. From 1816 to 1827, the exports from this province averaged annually $850,131. The following summary exhibits the total trade of Para for 1845: Inward—Vessels, 69; tonnage, 11,136; value of cargoes, $495,940; of which there entered from the United States: Vessels, 28; tonnage, 8920; value of cargoes, $236,200. Cleared to all countries—Vessels, 70; tonnage, 11,445; value of cargoes, $737,525. To the United States—Vessels, 27; tonnage, 3628; value of cargoes, $261,620. In this province, the sugar and coffee plantations do not produce sufficient for home consumption, and supplies are usually imported from the neighboring provinces. The imports from foreign countries consist of cotton goods, silks, hardware, wines, spirits, salt, flour, salt provisions, gunpowder, etc. The only manufactures are ordinary cotton cloths for sacks and hammocks, and India-rubber shoes; but these manufactures seem not to thrive, from a want of skill to direct them.

TOTAL NUMBER OF VESSELS, WITH THEIR TONNAGE, ENGAGED IN THE TRADE BETWEEN PARA AND FOREIGN COUNTRIES, AND VALUE OF EXPORTS AND IMPORTS, ETC., IN 1848 AND 1850.

1848.	Vessels.	Tons.	Francs.
Entered	83	12,828	Imports, 3,295,000
Cleared	83	12,029	Exports, 4,881,000
1850.			
Entered	96	16,877	Imports, 5,109,000
Cleared	92	10,433	Exports, 7,402,000

STAPLE PRODUCTIONS OF PARA, RELATIVELY CONSIDERED, WITH RESPECT TO THE QUANTITIES ANNUALLY EXPORTED:

Caoutchouc	33,600 arrobas.
Cocoa	200,000 "
Cotton	6,120 "
Hides	15,500 pieces.
Copaiva	3,300 pots.
Rice	130,000 arrobas.
Rice in the husk	26,000 alqueires.
Sugar	21,330 arrobas.
India-rubber shoes	192,000 pairs.

The above are the leading exports from Para; but, besides these, the province produces various kinds of timber admirably adapted for ship-building purposes, and a great variety of textile plants, medicinal drugs, and dye-woods of the richest qualities. The present population of Para is about 205,000, though the province is said to be capable of maintaining some millions of inhabitants. With such a population, its natural resources might be more fully developed, and Para thus placed, in point of position and commercial importance, in the very first rank of Brazilian ports.—*Commercial Relations with the United States.*

Paraguay, a republic or consulship of South America, extends from lat. 21° to 27° 20′ S., and long. 54° to 58° 40′ W. The space thus inclosed forms a very compact territory, nearly in the shape of a parallelogram, about 430 miles long, north to south, with an average breadth of about 200 miles, and contains an area of about 86,000 square miles. Population 300,000. Capital, Asuncion. The name Paraguay at one time was used in a very extensive sense, so as to include the whole of the immense regions of South America, between lat. 16° S., and the Strait of Magellan, and between Chili and Peru on the west, and Brazil on the east, now confined to the republic properly so called. On the north the limits of this state with Brazil are not definitely settled, but in other directions it has the advantage of great natural boundaries; the Parana on the east and south, and its tributary the Paraguay on the west. The whole surface thus belongs to the basins of these two rivers, a mountain range of considerable elevation stretching between them north to south, so as to form their water-shed, and send the drainage in opposite directions, but nearly in equal portions. The distance of the water-shed from the river scarcely any where exceeds 100 miles, and hence the tributaries by which the drainage is conveyed are more remarkable for their number than their magnitude. By far the largest is the Tibimari, which, owing to an eastern bend in the water-shed, has its course considerably prolonged, and being augmented by several large affluents from the north, becomes a noble stream before it reaches the Paraguay. The surface is mountainous in the centre, and also in the northeast, where a ramification, known by the name of the Sierra de Maracay, or Cordillera de Maracara, breaks off from the central chain, and proceeding east to the banks of the Parana, interrupts the navigation of that river, and forms one of the most remarkable cataracts in the world.

Paraguay is one of the finest countries in the world. It is almost inclosed by rivers, and the interior is also bountifully watered. The exterior waters are navigable, and constitute the great avenues which are destined to become the highways of the commerce of a magnificent interior country. Unlike the open countries surrounding it, Paraguay is well wooded, and among its trees are many valuable in the arts and manufactures. It also abounds in medicinal products, as rhubarb, sarsaparilla, jalap, sassafras, dragon's blood, copaiva, nux vomica, liquorice, ginger, etc., all of the finest quality. Of dye-stuffs, too, there is an immense variety; as cochineal, indigo, vegetable vermilion, saffron, etc. Many of the forest trees yield valuable gums, and they comprise some of the most delicious perfumes and incense that can be imagined. Others, again, are like amber, hard, brittle, and insoluble in water. The *seringa*, or rubber-tree, the product of which is now almost a monopoly with Para, and also the *palosanto*, which produces the gum guiacum, crowd the forests, and the sweet-flavored vanilla is abundant. Upon the hills the celebrated yerba maté flourishes luxuriantly. The cultivated products are sugar-cane, cotton, tobacco, rice, mandioca, Indian corn, etc. On the plains thousands of cattle range, and large quantities of hides, hair, horns, bones, tallow, etc., are lost for want of transportation. The country is not celebrated for its minerals; but in all that constitutes an agricultural country, rich lands, a fine climate, and abundance of water, it has no equal. Hitherto, however, it has been shut out from the world by the arbitrary will of despotism; and its future commerce can only be measured from its resources and facilities. The recent revolutions in the states of the Plata have opened the magnificent rivers of this country, and there is certainly no further impediment to commercial enterprise.

This state, formerly a province of Buenos Ayres, withdrew from the connection in 1811, and the Spanish-American revolution breaking out about that date secured it from molestation. The policy of its rulers has been the exclusion of foreigners from the country, and under Dr. Francia, so celebrated in connection with its annals, the utmost despotism was exercised. The tyrant dying in 1840 the government was changed in its character, and a more liberal policy obtained,

and ultimately it has become in form an elective republic. As early as 1842, Paraguay acceded to the opening of its rivers to foreign commerce; but until the overthrow of Rosas, the tyrant of Buenos Ayres, who exercised authority over the estuary of the Plata, the concession was of no value. The successors of Rosas have now fully conceded free ingress and egress with the sea. These important revolutions in the policy of the two countries will eventuate in the development of the vast resources of the southeastern and middle portions of South America—countries which are unsurpassed in agricultural wealth and valuable commercial staples. For further information, see *American Statistical Annual*; *American Whig Review*, vi. 245 (U. S. Consul HOPKINS); *North American Review*, xxvi. 444 (A. H. EVERETT); *Dublin University*, xii. 474; *Quarterly Review*, xxvi. 277.

The commercial policy of Paraguay, however, is not of that liberal character to attract foreign merchants to its ports. In addition to the expense of purchasing stamped paper, by means of which every official transaction in the republic is conducted, and without which foreign merchants can not enter the markets, the internal taxes are such as to discourage efforts to develop the resources of the country, and, as a consequence, to oppress its commercial industry. The aggregate of these taxes bearing specially upon commerce is stated to amount to 26 per cent. on the value of every article sent to market. They consist of *diezmos* (tithes), 10 per cent.; export duty, 10 per cent.; and on rent of lands (almost wholly owned by the state, and fixed at a high valuation) 6 per cent. If to this be added an import duty of 20 per cent. on almost every article which the United States could send to the markets of Paraguay, it can be readily comprehended why the name of this republic does not appear among those of other foreign nations the details of whose commerce are minutely set forth in the annual Report on Commerce and Navigation, prepared by the Department of the Treasury of the United States. The "stamps," to which allusion has been made, are divided into eight classes: those of the first class cost 25 cents; of the second, 87½ cents; of the third, $1; of the fourth, $2; of the fifth, $6; of the sixth, $8; of the seventh, $16; of the eighth, $26. Permission to discharge or to load a vessel of 21 tons, or 2000 tons, can only be obtained on a stamp of this last description; so that to unload a cargo valued at $100 will cost $26—all the same as if it were worth $100,000; and in like manner as to taking cargo on board. The foreign trade of Paraguay is conducted chiefly through the ports of the Argentine Confederation, especially that of Buenos Ayres, and those of the Republic of Uruguay. The exports consist of yerba maté (with which the hills of the country are literally covered), tobacco, cigars, woods, hides, hair, leather, molasses, rum, white starch, mandioca, peanuts, beans, and oranges; of which latter article not less than 30,000 bushels are said to be exported per month. The exports from the United States which would most readily find a market in Paraguay are cotton domestics, calicoes, plain cloths, clocks, boots and shoes, gunpowder and shot, saddlery, and agricultural implements.

If the navigation of the River Vermejo, an affluent of the Paraguay, were opened to foreign commerce, or were even permitted to the Argentine flag, the United States would, it is believed, soon enjoy the entire foreign trade of the upper provinces of the Argentine Confederation. This privilege, however, is refused by the government of Paraguay, notwithstanding the River Vermejo, in its entire course, lies within the territories of the sister republic. Hitherto a selfish and illiberal policy excluded foreign vessels from the port of Albuquerque, a place 1600 miles above Asuncion, the capital of Paraguay, in the Brazilian province of Matto Grosso, which the government of that empire has declared open to the commerce of the world. Brazilian vessels were not permitted to descend the River Paraguay, which takes its rise in this province, nor are foreign vessels allowed to ascend higher than the city of Asuncion; thus cutting off all trade with the richest portions of Bolivia and the fertile province of Matto Grosso, in Brazil. The claim of Paraguay to exercise jurisdiction over both banks of this river, by prohibiting its navigation above Asuncion, and by closing the navigation of the Vermejo, both to the citizens of the Argentine Republic and to foreigners, has never been admitted.

A treaty between Paraguay and Brazil was duly signed and ratified June 14, 1856, by which it is stipulated that the waters of the Upper Paraguay shall henceforth be open to general navigation and commerce. This will bring not only the produce of the Brazilian province of Matto Grosso, but also the agricultural and mineral wealth of Bolivia, to an Atlantic market. The value of these mineral resources may be inferred from the fact that there are stated to exist in this region upward of a thousand valuable mines unworked, it having been found impossible hitherto to convey machinery thither, across the mountains, from the Pacific coast. A highway to the spot is now opened from the Atlantic, as broad as the Mississippi, and equally accessible. The rich province of Matto Grosso, with its diamonds, gold, silver, and copper, is also brought in connection with the good and contiguous sea-ports, Buenos Ayres and Montevideo, by the Paraguay River; and Cujaba, its capital, in the centre of the mining districts, can easily be reached from Asuncion. Dianantino, about two hundred miles from Cujaba, sends its produce to Santarem, on the Amazon, and thence to Para. This tedious and circuitous route is now superseded, as the Paragnay connects these markets with the estuary of the Plata. A Paraguayan journal, "*La Nacional*," of August 11, 1856, publishes the subjoined regulations: "All vessels from foreign ports to the Brazilian ports above shall take pilots at Asuncion, Concepcion, the junction of the Apa, and Olimpo. The vessels that descend that river from the upper Paraguay are obliged to take pilots from Olimpo, the junction of the Apa, and Concepcion; and the wages of the said pilots are to be agreed upon at the captain of the port's bureau in Asuncion."

In 1853, the United States steamer *Water Witch*, of 400 tons burden, and nine feet draught, was dispatched, under the command of Lieutenant Thomas J. Page, to make an exploration and survey of the tributaries of the River La Plata. The results of this expedition will, doubtless, contribute in an eminent degree to the advancement of commerce and the promotion of science. The navigation of the Paraguay River, which empties into the Parana at the distance from Buenos Ayres of 800 miles, was extended to the parallel of 18° south latitude; making the entire distance of the rivers Parana and Paraguay, through which this small sea-steamer had passed from Buenos Ayres to Corumba (an interior military post of Brazil), equal to about 1700 miles. There is no doubt that the navigation of the Paraguay, during the season of high water, could have been carried by the *Water Witch* to a still greater extent; but at the time of this exploration any further ascent was prohibited by Brazil. Permission was, however, subsequently granted by the imperial government, but refused by that of Paraguay. The expedition was thus restricted to a more limited exploration of the upper waters of this river than had been anticipated. It is to be hoped that the time is not far distant when all such prohibitions will be removed, and this interesting region of unknown country brought to the knowledge of the world.

The navigation of the Paraguay has thus been extended beyond Asuncion, to the distance of 650 miles. This fact has induced the Brazilian government to avail itself of this important channel of communication, by steam, with her northwestern province, Matto Grasso, in which is found the most valuable diamond region of the empire.

An expedition was dispatched by the French government, a few years since, for the exploration of the Parana and Paraguay rivers; and the following passage is translated from a report made in March, 1855, by Captain Picard, to whose charge it had been committed: "When we consider the excellent means of communication which nature has opened to the provinces of the Argentine Confederation and the Republic of Paraguay, we can not but regret to see them unemployed and deserted. The absence of population, continual civil war, and the administrative policy of Paraguay, have, so far, been the chief obstacles to progress. Let us indulge the hope that the day is not distant when the aspect of things will change, and these magnificent countries will flourish under the blessings of a more advanced civilization."

Paraguay can hardly be said to possess a merchant marine. In 1851 there were distributed, between the two ports of Asuncion and Villa del Pilar, 12 vessels, averaging each about 42 tons. In 1852 there were 11 of the same description, and in 1853 only 9. Besides these, there is one brig belonging to the government, which is said to monopolize almost exclusively the commerce of the state. The foreign vessels engaged in the trade of Paraguay in 1852 were 81, with an aggregate of 4582 tons, from the Argentine provinces south, below the Paraguay River, and three American vessels, tonnage not known. All these vessels trade with the ports of Asuncion and Villa del Pilar, which, with the port of Encarnacion, on the Parana, were alone open to foreign commerce. There is no treaty between the United States and Paraguay. With England a treaty was ratified November 2, 1853, by the second article of which the Republic of Paraguay concedes to the merchant flag of Great Britain the free navigation of the River Paraguay as far as Asuncion, the capital of the republic, and of the right side of the Parana, from where it belongs to her, as far as the city of Encarnacion. It stipulates, also, that British subjects shall be at liberty, with their ships and cargoes, freely and securely to come to, and to leave, all the places and ports of the said territories; hire houses and warehouses; and trade in all kinds of produce, manufactures, and merchandise of lawful commerce, subject to the usages and established customs of the country: also, that they may discharge the whole or part of their cargo at the ports of Pilar and where commerce with other nations may be permitted, or proceed with the whole or part of their cargo to the port of Asuncion, according as the captain, owner, or other duly authorized person shall deem expedient; and that, in the same manner, shall be treated and considered such Paraguayan citizens as shall arrive at the ports of Great Britain with cargoes in Paraguayan or British vessels.

There is an American company established in Paraguay, under a charter from the State of Rhode Island, which has been engaged in commercial operations for some time, under the title of "The United States and Paraguay Navigation Company." The chief object of this company is to introduce steam navigation on the rivers of Paraguay; but how far it has progressed in the accomplishment of this object, information is not at hand. The only direct trade, however, yet opened between the United States and this republic consists of some shipments of cigars and samples of wood made by this company. All other articles of Paraguayan produce which reach the United States come through the ports of Buenos Ayres or Montevideo, and are included in the custom-house returns to the Treasury Department of exports from the republics to which these places respectively belong.

The government of Paraguay puts forth no statistics relative to the commercial movements of the republic, and it is said to be quite impossible to obtain information on the subject from its administrative officials. Complete commercial statistics, which may be viewed as strictly accurate, can not, therefore, be looked for in this Digest; but the subjoined statements, derived from a Memoir prepared in 1853 by M. L. Geofroy, an attaché of the mission extraordinary sent by France to the Plata and Paraguay, are, no doubt, reliable, so far as they extend.

EXPORTS OF ASUNCION FROM JULY, 1851, TO DECEMBER 31, 1852.

Tobacco—229,000 arrobas, at 12 reals (or $1 50) per arroba of 25 pounds	$343,500
Yerba maté—175,000 arrobas, at 20 reals per arroba	437,500
Hides—Dry, 100,000, at 10 reals each	125,000
" Tanned, 35,000, at $3 each	105,000
Wood—Cedar, 50,000 yards, at 4 reals	25,000
" Cabinet, a sloop-load of 7000 to 8000 arrobas	6,000
Hair—600 quintals, at $8 per quintal	4,800
Sweetmeats—30,000 arrobas, at 6 reals per arroba.	15,000
Cigars—2,000,000, at $2 per 1000	4,000
" 250,000, at $5 per 1000 (in boxes of 100)	1,250
Sundry products—White wax, rum, molasses (several cargoes), common wood (Urunday and Lapacho), several cargoes of oranges, maize, pulse, etc.; cotton, 1,500 arrobas; tiger-skins, 500, at $2 each; India rubber, otter-skins, hammocks, baskets, etc.; fringed napkins, lace, etc.	27,800
Total	$1,094,850

It is believed that the above total might be increased at least one-third, could exact statements be obtained. If we add the export duties of 10 and 6 per cent. on the articles exported—yerba and wood, which are government monopolies, and are exempt from duty, being excepted, and which would amount to about $70,000—and $20,000 in silver, exported in contraband, and $10,000 for sundry charges—we have $1,500,000, or an amount equal to the value of imports during the same period. Indeed, such is the scarcity of money in circulation, that the trade is necessarily one of barter; so that the figures which represent the value of imports may also, generally, give the value of exports.

Measures.—The arroba equals 25 lbs.; the cubic vara about 20½ cubic feet; the pesada 36 lbs.; the almude about three-fourths of a bushel; the asumbre about one quart; the frasco about half a gallon; the fanega about four bushels. It may be observed, that these denominations of weight and measure represent different quantities in different countries, and even in the same countries, as regards different articles.

IMPORTS AND EXPORTS OF ASUNCION FROM 1851 TO 1854.

Years.	Imports.	Exports.	Total.	Duties paid.
1851	No data.	$341,380	No data.	No data.
1852	$549,150	474,499	$1,014,649	$128,276
1853	406,668	691,932	1,098,620	56,564
1854	585,523	777,457	1,362,980	122,280

Among the importations of 1854, tissues and wines hold the first rank, or, rather, they constitute four-fifths of the total value of imports.

Navigation.—Transportation by land being extremely difficult, the commercial movements already analyzed were effected by water—by the Paraguay, an affluent of the Parana. From the opening of the port of Asuncion in July, 1851, to December, 1852, there arrived about 120 sloops, of 6000 arrobas, on an average, for each. A cargo of 7000 arrobas equals 60 tons, which would give an average of from 40 to 80 tons for each vessel. From January 1, to February 28, 1853, there arrived at Asuncion 30 Sardinian vessels. These vessels, the owners of which, or the greater part of them, were Sardinians, sailed under the Uruguayan or Paraguayan flag. There arrived also, up to March 10, 1853, at this port, 19 sloops. In 1854 there arrived 160 merchant vessels, averaging each 50 tons burden. Of these, 2 were British, 81 were under the flag of the republic, 116 belonged to the Argentine Confederation, and 11 to Uruguay.

The customs tariff of Paraguay, now in force in that republic, is that promulgated by a decree given at Asuncion, January 2, 1846.—*Commercial Relations of the United States.*

Parallels of Latitude, on the Terrestrial Sphere, are small circles parallel to the equator; but in the Celestial Sphere they are parallel to the ecliptic.

Paramaribo, the capital town of Dutch Guiana, on the west bank of the Surinam, five miles from its mouth in the Atlantic, lat. 5° 49′ N., long. 55° 22′ W. Estimated population, 20 000, mostly blacks. It is regularly and well built; streets unpaved, but ornamented with rows of tamarind and orange trees; and it has Lutheran, Calvinistic, Roman Catholic, and English churches, Portuguese and German-Jewish synagogues, and is the centre of the trade of the colony. Fort Zeelandia, north of the town, is the residence of the governor. In a hospital for lepers, on the right bank of the Coppename, 450 patients are maintained at the expense of the colony. The Kwatta Canal, begun in 1846, is the first public work executed by free laborers.

Paramo (sometimes rendered, though incorrectly, by *desert* or *heath*). The name given in South America to a mountainous district covered with stunted trees, exposed to the winds, and in which a damp cold perpetually prevails. Under the torrid zone the Paramos are generally from 10,000 to 12,000 feet in height. Snow often falls on them, but remains only a few hours; in which respect they are distinguished from the *Nevados*, which enter the limits of perpetual snow. The Paramos are almost constantly enveloped in a cold, thick fog; so that when a thick, small rain falls, accompanied with a depression of the temperature, they say at Bogota, or at Mexico, *cae un paramito*. Hence has been formed the provincial word *emparamarse*—to be as cold as if one were on a *paramo*. —Humboldt's *Pers. Nar.* ii. p. 252.

Parasang, a Persian measure of length; according to Herodotus, equal to 30 stadia, and (reckoning eight stadia to the English mile) equal to 3¾ English miles. The length of the parasang was reckoned differently by different authors; and such are the discrepant estimates of the ancients that some have assigned it the length of 60 stadia. The word is supposed to be derived from the Persian *seng*, signifying *a stone*.

Parcel, a term indifferently applied to small packages of wares, and to large lots of goods. In this latter sense, 20 hogsheads of sugar or more, if bought at one price, or in a single lot, are denominated "a parcel of sugar."

Parcels, Bill of, an account of the items composing a parcel.

Parchment and **Vellum**. The former consists of the skins of sheep and goats, and the latter of those of calves, prepared in such a manner as to render them suitable for being written upon, for covering books, and other purposes. The consumption of these articles is very considerable. In this and most other countries it is customary to use them instead of paper in the drawing up of a great variety of deeds and other legal instruments. They are also extensively used, especially in Italy, in the binding of books. The finest copies of the magnificent classics which issued from the Dutch presses in the 17th century, and the early part of the 18th, were all bound in vellum. Parchment is coarser than vellum, and not so well adapted for writing upon. The qualities of both articles differ very widely; so much so that the best parchment is preferable to inferior or even middling vellum. The goodness of each depends partly on the quality of the skins of which they are made, and partly, and indeed in a very high degree, on the care and skill with which they are manufactured.

The history of these articles is involved in some obscurity. Varro and Pliny (*Hist. Nat.* lib. xiii. cap. 11), who have been generally followed, state that they were originally manufactured at Pergamus, in Asia Minor, the capital city of Eumenes II., one of Alexander's successors, during the reign of that prince; and that parchment owes to this circumstance its classical name of *charta Pergamena*. But there seems to be little if any foundation for this statement. We have seen, in the preceding article on paper, that Herodotus, who flourished rather more than a century before Alexander the Great, states distinctly that, previously to his era, when paper (*charta Egyptiaca*) was scarce, the Ionians were accustomed to write on the skins of sheep and goats, and that that practice was then followed (viz., in his time) by several barbarous nations. —Lib. v. cap. 58. And it is all but certain, seeing that the practice of writing on skins had been in use for at least 2½ centuries, and probably much more, previously to the era of Eumenes, that their preparation would, in the course of that lengthened period, be so much improved as to render them little different from parchment. It is probable, indeed, that their manufacture may have been improved in Pergamus; but we incline to think that parchment owes its name rather to the extensive demand for it in that city, in consequence of Eumenes having amassed a large and valuable library, than to any thing else. He was, in fact, compelled to use parchment and vellum in the copying of books, as his contemporary Ptolemy Philadelphus had prohibited the exportation of paper.—Pliny, *ubi supra*. The scarcity of parchment during the Middle Ages, and in antecedent times, led to the practice of obliterating the writing on old parchments, by rubbing them with pumice-stone, immersing them in boiling water, and such like devices; and there can be no manner of doubt that the prevalence of this practice has been most injurious to literature, and that it has most probably occasioned the total destruction of some of the noblest *chefs-d'œuvre* of antiquity. In the Middle Ages, these were erased that room might be made for some worthless treatise on scholastic theology or logic! Sometimes, however, it happens that the ancient writing is not so much obliterated but that it may still be read; and to that circumstance the recent discovery of a portion of Cicero's treatise *De Republica* is to be ascribed. It had been effaced to make room for a commentary of St. Augustine on the Psalms. Parchments that have been erased in this way are called *Palimpsests* (from *παλιν*, *again*, and *ψαω*, *to efface or clean*), or repeatedly cleaned parchments; because they have been repeatedly cleaned, renewed, or prepared for writing upon. If the learned world is ever to be gratified by the recovery of the lost comedies of Menander, or the lost books of Polybius, Livy, and Tacitus, it will most probably be by finding them under some homily or such like trash.—*Nouveau Traité de Diplomatique*; *Dom de Vaines*.

Paris (anc. *Lutetia Parisiorum*), the capital of France, and, after London, the largest and most populous city in Europe; lat. (observatory) 48° 50′ 12″ N., long. 79° 23′ 02″ E. from the national observatory, Washington, and long. 2° 20′ 30″ E. from London. Population in 1851, 1,021,530. Situated 193 feet above the level of the sea, on both sides and on two islands of the Seine, 111 miles from its mouth. It has recently, and at the expense of about £100,000,000, been surrounded with fortifications, consisting of a wall 33 feet in height, bastioned and terraced, lined with a fosse about 20 feet deep, and embracing both banks of the Seine, with a continuous inclosure, and of outworks composed of 14 detached forts. These fortifications take in much of the suburbs, and even of the surrounding country; but the proper limits of the town are traced by an interior wall, erected at a much earlier date, for fiscal purposes. In this wall are 50 gates or barriers, which form the proper entrances of Paris, and at which the *octroi*, or duties on goods brought into it, are levied. Many of these barriers are magnificent structures. Among others may be specified the Barrière de Neuilly, consisting of two pavilions, and having in front the splendid triumphal arch De l'Etoile; the Barrières de Vincennes, de St. Martin, de Fontainebleau, de Reuilly, de Chartres, and de Passy. Outside the barriers and their connecting wall is a large zone, finely planted, which nearly makes the circuit of the town, and forms an excellent, though not very

much frequented, promenade. It receives the name of Outer Boulevards, to distinguish them from the Inner Boulevards, which form a similar internal zone, consisting, in their finest parts, of a magnificent central thoroughfare, bounded on either side with a double row of trees, under which a broad and elevated pathway has been formed, and lined by elegant shops and mansions, the whole forming a scene of animated gayety and splendor which no other capital in Europe can equal.

The Seine traverses the city in a west-northwest direction, and has a medium breadth of about 450 feet, nearly one-third less than that of the Thames at London. It is shallow, and navigable only by barges and small steamers. Its quays are built of solid masonry, and form large terraces, with a roadway in the centre, and a footpath on either side, generally planted. They extend about 11 miles, and, in addition to the splendid walks which they afford, serve the important purpose of protecting the lower parts of the city from inundations, from which, previously to these erections, it often suffered. The number of bridges is twenty-seven, all of stone, with the exception of seven suspension bridges, three of a combination of stone and iron, and one of wood.

Manufactures and Trade.—The government possesses only two properly manufacturing establishments—that known by the name of the Gobelins, celebrated for its tapestry and carpets, made, however, not for sale, but the supply of the palaces, and for presents; and that of tobacco, which the government holds as a monopoly, and carries on in a vast establishment on the south side of the Seine, producing about a fifth of all the snuff used in the kingdom, and yielding an annual profit estimated at $14,000,000. In the other branches, which are free, the most important manufactures are articles of jewelry and precious metals; ebony and ivory trinkets, fine hardware, paper-hangings, saddlery, and other articles in leather; cabinet-work, carriages, various articles of dress, silk and woolen tissues, particularly shawls and carpets; lace, embroidery, artificial flowers, combs, machines, mathematical and optical instruments, types, books, engravings, refined sugar, chemical products, etc. The value of all the industrial products of Paris in 1847 was, after a very careful investigation, estimated at $292,725,670. In 1848, during the turmoil of the last revolution, they fell to less than one half of what they were before. The value of the exports, composed almost entirely of the above articles of manufacture, was declared at the custom-house of Paris to amount in value, in 1850, to $11,095,945. The estimated revenue of the city for 1852 was $9,308,630; and the expenditure $9,703,630.—*See article* FRANCE. For commerce, etc., of Paris, *see* HUNT's *Merchants' Magazine*, xviii. 60; *Quarterly Review*, lxxviii. 146; *Living Age*, ii. 404, xiii. 219; *Foreign Quarterly*, xxxi. 182; *Edinburgh Review*, lxxxv. 89; *Comm. Rel. U. S.*

The commercial intercourse between the United States and this consular district depends on the regulations of the custom laws of the empire, and on the local legislation of the city of Paris, by which *octroi* duties are levied on many articles brought into the city, whether foreign or domestic, but especially on spirits and articles of subsistence. These regulations are fixed, and rest only on the contingency of alteration by legislative enactment. There are some privileges accorded to Spain by ancient treaties which will be found set forth in the *Code des Douanes*, *Code Maritime*, and the *Tarif des Droits*. We are not aware of any privileges accorded to the commerce of other nations and denied to the United States, or of any important restrictions. The books referred to above give full information, in tabular statements, on this question. The transhipment of goods belongs to the coasting trade, and, by law, only French vessels are entitled to engage in this trade. Full information will be found upon this point in the *Code Maritime*.

Rates of insurance, by steamers, on goods,	¾ to 1½ per cent.
" " by ships,	1 to 1½ "
" " by steamers, valuables,	1 to 1½ "
" " by ships,	1 to 1 "
Commissions for shipping	2 francs each package.
Commissions for purchasing in large quantities	3 per cent.
Commissions for purchasing in small quantities	5 "
Average rate of exchange between New York and Paris	5 18¾ francs.

Sales of goods are made upon cash or upon orders, with credits from thirty days to six months. Commission houses are in the habit of advancing for many of their customers.—See *Tarif des Droits*, *Regulations des Douanes*, and *Statistique Industriel*.

Parrel. In *Naval language*, the collar of greased rope, or trucks, by which the yard is confined to the mast, while it slides up and down it.

Partnership. A partnership is an agreement between two or more to share in the profit and loss of the use and application of their capital, labor, and skill, in some lawful business, whether one supplies capital, and another skill and labor, or each both labor and capital. The benefits of a union of the means and advantages of different persons for the conduct of a branch of business, in many instances, are too obvious and common to need illustration. A partnership is not constituted merely by an interest of different parties in the same thing, but it depends on a participation of profits and joint liability to loss. And yet there are some exceptions to this rule, for it has been held that seamen shipping on shares in a shipping voyage are not copartners with the owners. And so, where a certain share or commission is allowed to a clerk or agent, depending on the success of the business or amount of profits, in addition to his other compensation, it has been held, in many cases, not to make him a copartner. It is difficult to point out the criterion by which cases of this description are distinguished from those of copartnership; and some of them look more like an exception of cases which strictly come within the definition of copartnership. A question has been made whether joint owners of a ship are copartners, and the general doctrine is that they are not so; and yet it is generally held that each one is liable for the whole amount of repairs and expenditures in the navigation of the ship; but still the ownership is not joint, for, in the case of the decease of one, the property in the whole ship does not survive to the others, as would be the case if it were partnership property, but the property is held in common, each part-owner having a distinct title to his share; and one part-owner can not, merely as such, convey a title to the whole ship, or to any share except his own. As to the share of each partner in the profits, or his liability for losses, if there is no agreement on this subject, all the partners stand upon an equal footing.

As to the objects of copartnership, they are not confined to commerce, though most frequent in that branch of industry, but may embrace manufacturing, the carrying on of any mechanic art, agriculture, the practice of law or medicine, and, in short, every lawful branch of business. Copartnership is more usually formed by a written agreement; and by some codes and in regard to certain copartnerships, formal stipulations are required by law in order to constitute a copartnership. This is not a general rule, however, for in many branches of business parties may agree orally for a participation in profit and loss. These associations are divided into different classes, distinguished by their objects, and the extent of the liability of each partner. The Roman law allowed of general copartnerships, extending the community of property, and joint profit and loss, not only to the business pursued, but also to all acquisitions by either party, whether by legacy, inheritance, gift, or as the fruits of industry. By that law, and so by the laws of France, Spain, Louisiana, and other codes derived from the Roman law, a man and his wife may

be copartners; and, in making the marriage contract, the kind and extent of copartnership is agreed upon, the form of the stipulation for this purpose being particularly pointed out by the French code. It was between the parties to the marriage contract that the general copartnerships above-mentioned were most frequently formed. In this respect, however, the Roman law, and those codes derived principally from it, leave the parties at liberty to agree upon a universal copartnership or a limited one, or a separate property.

Copartnerships are usually confined to the prosecution of a particular branch of business, and it very often happens that each copartner is concerned in other branches. The term *general copartnership* is also applied to one formed for trade generally, or business generally, without limitations; but where the joint interest extends only to a particular concern, as, for instance, the freighting of a ship, it is called a *special copartnership*. And so a partnership is called *special* when the parties enter into stipulations modifying and restraining the right and powers of the members, instead of leaving them to the operation of the laws generally applicable to such associations; and this is the usual meaning of such copartnerships. Another description is that of *limited* copartnerships, in which one or more partners put in a certain amount of capital, which is liable for the contracts of the firm; but beyond this the party or parties are not liable. This sort of partnership is particularly provided for in the French code, and is not unfrequent in France. It is a very useful provision of the law that allows of such associations, for it enables persons of fortune, and retired from business, to put a part of their capital at risk in trade, without risking their whole property; and it accordingly operates very favorably upon the enterprise of the community; for a young man who has only his talents and industry to put into a concern can thus more easily obtain the capital necessary to give his activity and enterprise scope, and every community ought to open all practicable channels for the intellectual and physical exertions of its members. This species of copartnership has accordingly been partially introduced into the United States, being provided for in the code of Louisiana, which is modeled on the French code, and having been introduced also into the laws of New York by a statute, the provisions of which were closely copied from the French code—the first instance (as Chancellor Kent remarks in his Commentaries) in which any other foreign law than the English had been adopted in the particular structure and provisions of an American statute, in those States of whose codes the English law is the basis. This species of partnerships has also been authorized by statute in Massachusetts, Rhode Island, Connecticut, Vermont, New Jersey, Pennsylvania, Maryland, South Carolina, Georgia, Alabama, Florida, Mississippi, Indiana, and Michigan. We will now proceed to a more extended account of limited partnerships.

The condition of a limited partnership is that the name of the person whose liability is thus limited must be used in the firm, and particular provisions are made as to paying in the amount of capital stipulated; and another suitable provision in such case is the provision for some registry by which it may appear to those who wish to make the inquiry what amount such partner pays in. Some partnerships are *secret;* that is, some one agrees, upon terms, to share profits with ostensible partners without any notice to the public of his being a member of the firm. Each partner has a joint interest in the whole personal property, and, unless the articles stipulate otherwise, may transfer it.

Each partner may also bind the whole firm by his contract made in the course of the business of the firm, unless it be otherwise agreed between them; and even when it is otherwise agreed, still, if a party with whom a partner contracts has a legal right, from the manner in which the joint affairs are managed, to presume that a partner is authorized to contract for and to bind his copartners in regard to the subject of any contract, the firm will be bound by such contract. But if the party contracted with has notice that, by the articles of copartnership, a partner has not authority to make a contract, the company will not be bound by it. So if a partner contracts, in the partnership name, in a manner which the party contracted with knows is not within the business of the firm—as if he makes a negotiable note in the name of the firm for his own separate debt—the contract will not bind the firm to the party thus contracted with; but still, if this contract, being transferable in its nature, and holding out on the face of it the responsibility of the whole firm, is negotiated to those who have no notice that the paper was made for the private accommodation of the partner who signed the partnership name, the company will be bound in respect to such assignee; that is, the firm having given notice to the world that they are copartners in a certain branch of business, every one has a right to presume that all acts done by each of them in regard to it are authorized by the terms of their contract, or the circumstances of the case, unless he has notice to the contrary. But certain acts are not authorized by the general powers of copartners, and those no one partner can be presumed to have power to do; as, for instance, one partner is not merely, as such, authorised to make a deed in the name of the other, or to act as his attorney; and he can not, accordingly, convey land belonging to the members of the company; for, though it may have been acquired and paid for with the property of the firm, yet when acquired, it belongs to the members in common, if the title be in them all, and each member can himself convey only his share; and in order to the conveyance of that of another, he must be specially empowered. But a partner may release a debt due to the firm if it be done fairly, and without collusion between him and the debtor. It has been held, however, that one partner can not by deed submit a question to arbitration. A partnership may be dissolved by its own limitation, the death, bankruptcy, or insanity of a member, or by the breaking out of a war between the countries to which the members belong.

A question is also made whether a member may dissolve the copartnership voluntarily before the time for which it was formed expires, and the opinion seems to be that he may do so by giving sufficient notice to this effect; and this seems to be necessarily incident to new associations; for, though he would, in such case, be answerable to his copartners for the breach of his agreement, yet it would be exceedingly inconvenient if a partner were irrevocably bound to give his copartners the right of his credit, and of disposing of his property, after all his confidence in them had ceased. In case of mismanagement by any partner having charge of the partnership effects, so that the other partners are liable to be materially injured, they may make application to a Court of Chancery to appoint a receiver to take charge of the concerns of the company, and wind up its affairs, in case the partnership has already been dissolved, or in case there appears sufficient reason to dissolve it. But where there is no ground for such application to a Court of Chancery, and the company is dissolved by the death of one partner, the joint property will survive to the other partner, who may dispose of it, and collect and pay the debts of the concern, and will be liable to account to the personal representatives of the deceased partner for his proportion of the surplus property. In case of the decease of a partner, his personal representatives do not become copartners with the surviving partners, but the affairs of the concern must be settled with reference to the time of the death of the deceased partner.—E. A.

Limited Partnership in New York.—1. According to the Revised Statutes of the State of New York, limited partnership for transaction of any mercantile, mechanical, or manufacturing business within the State may

be formed of two or more persons; but the provisions of the act will not authorize any such partnership for the purpose of banking or making insurance. 2. Such partnerships may consist of one or more persons, who shall be called general partners, and who shall be jointly and severally responsible, as general partners now are by law; and one or more persons who shall contribute, in actual cash payments, a specific sum as capital to the common stock, who shall be called special partners, and who shall not be liable for the debts of the partnership beyond the fund so contributed by him or them to the capital. 3. The general partners only shall be authorised to transact business and sign for the partnership, and to bind the same. 4. The persons desirous of forming such partnership shall make, and severally sign, a certificate, which shall contain: I. The name or firm under which such partnership is to be conducted. II. The general nature of the business to be transacted. III. The names of all the general and special partners interested therein, distinguishing which are general and which are special partners, and their respective places of residence. IV. The amount of capital which each special partner shall have contributed to the common stock. V. The period at which the partnership is to commence, and the period at which it shall terminate. 5. The certificate shall be acknowledged by the several persons signing the same, before the Chancellor, a Justice of the Supreme Court, a Circuit Judge, or a Judge of the County Courts; and such acknowledgment shall be made and certified in the same manner as the acknowledgment of conveyance of land. 6. The certificate so acknowledged and certified shall be filed in the office of the clerk of the county in which the principal place of business of the partnership shall be situated, and shall also be recorded by him at large in a book to be kept for the purpose, open to public inspection. If the partnership shall have places of business situated in different counties, a transcript of the certificate, and of the acknowledgment thereof, duly certified by the clerk in whose office it shall be filed, under his official seal, shall be filed and recorded in like manner in the office of the clerk of every such county. 7. At the time of filing the original certificate, with the evidence of the acknowledgment thereof, as before described, an affidavit of one or more of the general partners shall also be filed in the same office, stating that the sums specified in the certificate to have been contributed by each of the special partners to the common stock have been actually and in good faith paid in cash. 8. No such partnership shall be deemed to have been formed until a certificate shall have been made, acknowledged, filed, and recorded, nor until an affidavit shall have been filed, as above directed; and if any false statement be made in such certificate or affidavit, all the persons interested in such partnership shall be liable for all the engagements thereof as general partners. 9. The partners shall publish the terms of the partnership, when registered, for at least six weeks immediately after such registry, in two newspapers, to be designated by the clerk of the county in which such registry shall be made, and to be published in the senate district in which their business shall be carried on; and if such publication be not made, the partnership shall be deemed general. 10. Affidavits of the publication of such notice, by the printers of the newspapers in which the same shall be published, may be filed with the clerk directing the same, and shall be evidence of the facts therein contained. 11. Every renewal or continuance of such partnership beyond the time originally fixed for its duration shall be certified, acknowledged, and recorded, and an affidavit of a general partner be made and filed, and notice be given in the manner herein required for its original formation; and every such partnership which shall be otherwise renewed or continued shall be deemed a general partnership. 12. Every alteration which shall be made in the names of the partners, in the nature of the business, or in the capital or shares thereof, or in any other matter specified in the original certificate, shall be deemed a dissolution of the partnership; and every such partnership which shall in any manner be carried on after any such alteration shall have been made, shall be deemed a general partnership, unless renewed as a special partnership, according to the provisions of last section. 13. The business of the partnership shall be conducted under a firm, in which the names of the general partners only shall be inserted, without the addition of the word "Company," or any other general term; and if the name of any special partner shall be used in such firm, with his privity, he shall be deemed a general partner. 14. Suits in relation to the business of the partnership may be brought and conducted by and against the general partners, in the same manner as if there were no special partners. 15. No part of the sum which any special partner shall have contributed to the capital stock shall be withdrawn by him, or paid and transferred to him, in the shape of dividends, profits, or otherwise, at any time during the continuance of the partnership; but any partner may annually receive lawful interest on the sum so contributed by him, if the payment of such interest shall not reduce the original amount of such capital; and if, after the payment of such interest, any profits shall remain to be divided, he may also receive his portion of such profits. 16. If it shall appear that, by the payment of interest or profits to any special partner, the original capital has been reduced, the partner receiving the same shall be bound to restore the amount necessary to make good his share of capital with interest. 17. A special partner may, from time to time, examine into the state and progress of the partnership concerns, and may advise as to their management; but he shall not transact any business on account of the partnership, nor be employed for that purpose as agent, attorney, or otherwise. If he shall interfere contrary to these provisions, he shall be deemed a general partner. 18. The general partners shall be liable to account to each other, and to the special partners, for their management of the concern, both in law and equity, as other partners now are by law. 19. Every partner who shall be guilty of any fraud in the affairs of the partnership shall be liable civilly to the party injured to the extent of the damage, and shall also be liable to an indictment for a misdemeanor, punishable by fine or imprisonment, or both, in the discretion of the court by which he shall be tried. 20. Every sale, assignment, or transfer of any of the property or effects of such partnership, made by such partnership when insolvent, or in contemplation of insolvency, or after, or in contemplation of the insolvency of any partner, with the intent of giving a preference to any creditor of such partnership or insolvent partner, over other creditors of such partnership, and every judgment conferred, lien created, or security given by such partnership under the like circumstances, and with the like intent, shall be void, as against the creditors of such partnership. 21. Every such sale, assignment, or transfer of any of the property or effects of a general or special partner, made by such general or special partner when insolvent, or in contemplation of insolvency, or after, or in contemplation of the insolvency of the partnership, with the intent of giving to any creditor of his own, or of the parnership, a preference over creditors of the partnership, and every judgment conferred, lien created, or security given by any such partner under the like circumstances, and with the like intent, shall be void, as against the creditors of the partnership. 22. Every special partner who shall violate any provision of the two last preceding sections, and who shall concur in and assent to any such violation by the partnership, or by any individual partner, shall be liable as a general partner. 23. In case of the insolvency or bankruptcy of the partnership, no special partner shall, under any circumstances, be allowed to

claim as a creditor until the claims of all the other creditors of the partnership shall be satisfied. 24. No dissolution of such partnership by the acts of the parties shall take place previous to the time specified in the certificate of its formation, or in the certificate of its renewal, until a notice of such dissolution shall have been filed and recorded in the clerk's office in which the original certificate was recorded, and published once in each week for four weeks in a newspaper printed in each of the counties where the partnership may have places of business, and in the State papers.—Leone Levi's *Commercial Law of the World.*

Analysis of the general Law of Partnerships.—Partnership in Great Britain is a contract entirely free, and subject to no formalities; it belongs to the parties themselves to regulate the conditions; the law is merely circumscribed in protecting the rights of third parties, and to see them respected. Partnership in common law is divided into three classes—universal, general, and limited or special. They are also divided into private partnerships and public companies. Public companies are divided into unincorporated companies or associations, and incorporated companies, and corporations chartered by government. By the law of Scotland partnerships are divided into ordinary partnerships, joint-stock companies, and public companies. In the first the firm is a distinct person at law, and the partners, although jointly and severally liable for all the debts and contracts of the firm, are so as guarantors of the firm. This is general partnership. Special partnership is one contracted for a particular branch of business.

There are principles connected with the law which are identical in every country; namely, that all members of an ostensible partnership, or in collective name, are responsible in solidum; but differences appear in points regarding the continuation or cessation of partnership after the decease of one of the partners. Thus in Prussia or Frankfort, the heirs continue the partnership until the end of the year, and if they do not give notice of their retirement, or if they are not excluded by the other partners, they do not cease to form part of it.

In France partnership ends of full right at the instant of the death of a partner, unless by contrary agreement this last regulation has been generally adopted. It is the same for that by which the profits distributed among partners are not to be returned to the partnership fund, whatever may happen afterward, unless there be fraud, and the provision is added, that a partner who brings in only his labor can not, in any case, return the dividends which he has received.

Almost every legislation except that of Great Britain recognises the existence of three kinds of commercial partnerships. 1st. Ostensible partnerships (in collective name); 2d. Partnerships *in commandité*; 3d. Anonymous partnerships.

The Portuguese code specifies each kind of partnership, indicating their rules at some length. In effect, besides the partnership anonymous, dormant, or secret, and in collective name, that of capital and labor is made prominent; in this case the partner with capital alone is responsible beyond his investment, in consequence of which the law characterizes this association as irregular. Then come partnerships in participation, with limited or unlimited capital, called Pareeria, either for an indivisible object, or for a determinate end; but in all cases it is necessary that it should refer to a commercial operation, and that there be at least one merchant either dormant or ostensible. There are in this code some regulations worthy of being noted; namely, that a contract which would free the provider of funds from all obligations, when he has a share in the profits, is null, but then he becomes an interested party, and not a partner. A contract is declared usurious which should allow to a lender of money the profits besides the interests, without subjecting him to the losses, which is very proper and just; because the principle of equality ought to govern, above all, matters of partnership; consequently this last clause ought to be annulled if it existed. In general, a minor, even not a trader, may not be a partner; but he has power to make use of the privilege of restitution in case of loss. If, at his coming of age, he has not declared that he wishes to retire, he becomes responsible for all further acts of the partnership.

It is most essential in partnership in collective name that the partners should all be responsible *in solidum*. In this the Dutch code is equal in all points to the French code; but the former code contains a derogation from this rule surprising at first, because it says that a collective partner who has become *commanditaire* is not responsible *in solidum*. The reason of this extraordinary regulation is founded upon the usage which permits the continuation of ancient commercial houses, known under the names of their founders, although these have still their capital invested in them; true it is that third parties ought to have been acquainted with it by the liquidation of the preceding house, or by the publication of the dissolution.

In the Spanish code there is a regulation different from any other legislation in matter of constitution of anonymous partnerships, by subjecting the articles, not to the examination of the government, but of the tribunals of commerce. The Spanish code and that of Portugal prescribe a measure the same as that of the Code Napoleon, which consists in making interests to run in full right, on the investments of the partners, from the day in which they ought to be made. With regard to the nomination of managers of partnership, in France the law has no provision for it. In Würtemberg and in Spain, when the manager is nominated by the articles, it is allowed, should his action be injurious to the interests of the company, to add another member. In Russia it is prohibited to confer by the articles the management of the partnership on certain parties for all its duration and without a renewal.

All legislation is silent upon the interests of the capital invested by the shareholders. It is, in fact, clear that an investment of funds in a partnership is not an employment, but a sum bestowed for mere operations, and which can only allow to raise sums on the realised profits, either every year, or at the time when balance-sheets are drawn up according to law, or at any other time, periodical or not. But in Hungary the "*commanditaires*," improperly called partners, because they are then only considered as lenders of money, may stipulate for interests beyond the legal rate which the other partners ought to pay, even if they should suffer losses. It is the same in Prussia.

With regard to the emission of shares and their transference, the Hungarian code contains very important regulations. It says that all persons may buy shares, but it proscribes shares to the bearer—a regulation which was reproduced in the Russian code and in the Würtemberg code. It says also that no investment of capital can be made nor interests claimed before the constitution of the partnership, and that only when all shares are disposed of the shareholders may establish the articles. Lastly, there is the remarkable regulation, that when the majority of shareholders have voted for a change or modification in the articles, of a nature to alter the object of the partnership, the minority have power to retire.

The Russian code prescribes several very curious measures. The sale of shares, or promises of shares on credit, is prohibited. A portion of the profits must be taken to constitute a reserve fund; the unreclaimed dividend, after ten years, is united to the social fund, or may be divided among the other shareholders. Lastly, if the directors are divided in their deliberations, the dissenting minority may exact that mention be made of their opinion in the verbal process. The same code indicates the mode of terminating disputes:

between shareholders or directors they may, with their consent, be decided by the general meeting, or by arbitrators; when third parties are concerned, it stands always with the tribunal of arbitrament to decide as a forced jurisdiction. In France the same clause is equally precise. But various modern legislations inserted regulations against this mode; thus the code of Würtemberg permits parties to derogate from it; the Hungarian code says that disputes among partners shall be brought before the Tribunal of Commerce; and if it regards bills of exchange, or in case of insolvency, they shall be adjudicated upon by the ordinary tribunals. The Lombardo-Venetian code does not reproduce the section of the French code, called *On Disputes among Partners*. The recent codes of Nassau and Sardinia do not contain any regulation on this matter. In England, when a reference is depending, made, or determined, it may be a bar; but the agreement of the parties does not oust either courts of law or equity, as the former will not allow their jurisdiction to be ousted by any private arrangement, and equity will not decree a specific performance thereof.

The law of merchants differs from the common law in the power of binding a partner by deed.

Lord Kenyon said, in Harrison *v.* Jackson, 7 S. R. 210: "The law on merchants is part of the law of the land, and in mercantile transactions it never was doubted but that one partner might bind the rest. But the power of binding each other by deed is now for the first time insisted on. A general partnership agreement, though under seal, does not authorize the partners to execute deeds for each other, unless a particular power be given for that purpose. Yet in common law a partner has power to bind his copartner by deed."

Although, in the words of Hobart, C. J., "The custom of merchants is part of the common law of the United Kingdom, of which the judges ought to take notice; and if any doubt arise to them about their custom, they may send for the merchants to know their custom, as they may send for the citizens to know their law;" yet, on the other hand, Lord Holt says, "We take notice of the laws of merchants that are general, not of those that are particular usages."—See *Westminster Review*, xx. 58; *American Quarterly Review*, xix. 48; Hunt's *Merchants' Magazine*, xxiv. 66, xxxiii. 457, xxxv. 720. See also Leone Levi's *Commercial Law of the World*, 4to. London, 1854; and Kent's *Commentaries*, vol. iii.

Partners of the Masts, the wood-work round the mast at the deck, to strengthen and support the deck against the pressure of the mast. The term is also applied to the similar supports round the capstan and pumps.

Partridge Wood, a variegated wood imported from Martinique; it is said to be the produce of the *Heisteria coccinea*.

Passengers, in *Commercial navigation*, are individuals conveyed for hire from one place to another on board ship. Passage ships are those peculiarly appropriated to the conveyance of passengers. Passage ships are generally placed under certain regulations; and the extent to which emigration is now carried renders it of the utmost importance that these regulations should be carefully compiled. The greater number of emigrants are in humble life: few among them know any thing of ships, or of the precautions necessary to insure a safe and comfortable voyage; they are also, for the most part, poor, and exceedingly anxious to economize, so that they seldom hesitate to embark in any ship, however unfit for the conveyance of passengers, or inadequately furnished with provisions, if it be *cheap*. Unprincipled masters and owners have not been slow to take advantage of this; and in order to prevent the frauds that would otherwise be practiced on the unwary, it has been found indispensable to lay down some general regulations as to the number of passengers to be taken on board ships as compared with their tonnage, the quantity of water and provisions as compared with the passengers, etc. But this is no very easy task. If the limitations be too strict, that is, if comparatively few passengers may be carried, or if the stock of provisions to be put on board be either unnecessarily large or expensive, the cost of emigration is proportionally enhanced, and an artificial and serious impediment is thrown in the way of what should be made as easy as possible, consistent with security. But, on the other hand, if too many passengers be allowed, their health is liable to suffer; and should the supply of provisions be inadequate, or the quality bad, the most serious consequences may ensue.

In some respects passengers may be considered as a portion of the crew. They may be called on by the master or commander of the ship, in case of imminent danger either from tempest or enemies, to lend their assistance for the general safety; and in the event of their declining, may be punished for disobedience. This principle has been recognized in several cases; but as the authority arises out of the necessity of the case, it must be exercised strictly within the limits of that necessity.—*Boyce v. Badcliffe*, 1 Campbell, 58. A passenger is not, however, bound to remain on board the ship in the hour of danger, but may quit it if he have an opportunity; and he is not required to take upon himself any responsibility as to the *conduct* of the ship. If he incur any responsibility, and perform extraordinary services in relieving a vessel in distress, he is entitled to a corresponding reward. The goods of passengers contribute to general average.—Abbott *on the Law of Shipping*.

Passenger Act of the United States.—It is made the duty of the Secretary of State, by the second paragraph of the 18th section of the act approved 3d of March, 1855, to give notice, in the ports of Europe and elsewhere, of the provisions of the act to regulate the carriage of passengers in steamships and other vessels.

The special attention of United States consular officers is called to this act, and also to the instructions which have been issued by the Treasury Department in reference to it. It will be observed that, while this act prescribes spaces of certain clear superficial feet of deck to each passenger (other than cabin passengers), it moreover fixes a maximum, by restricting the number of such passengers allowed to be carried in any such vessel in the proportion of one to every two tons of said vessel's tonnage measurement, excluding children under the age of one year in the computation, and computing two children over one and under eight years of age as one passenger. It follows, that though a vessel might afford clear spaces of the dimensions indicated for a greater number of passengers than one to every two tons of her tonnage measurement, yet if the number shall exceed that allowed by her tonnage measurement the penalties imposed by the law would attach; or if her tonnage measurement should allow a greater number of passengers than according to the clear spaces prescribed by law she could carry, yet if the number shall exceed that allowed by the clear spaces prescribed by law the penalties imposed by the law would equally attach. In other words, the one rule, as to the number of passengers a vessel is entitled to carry, is a limitation upon the other. The tonnage of each vessel, according to custom-house measurement, must, therefore, be ascertained, as well as the measurement of the spaces allotted to passengers, in order to determine the number of passengers she is entitled to carry.

In order to determine the number of passengers a vessel is entitled to carry in accordance with the spaces prescribed by this act, the height between decks must be measured, not from the bottom edge of the carlines or deck beams, but from the under surface of the upper deck to the top floor below; and no space shall be con-

sidered available for passengers that has not, when measured in this manner, the height called for by the law, as the case may be; nor shall any space in the vessel of a less width than four feet be measured; provided, however, if the vessel shall, in accordance with the provisions of the first section of this act, carry any portion of her cargo, or any other article or articles, on any of the decks, cabins, or other places appropriated for the use of passengers, in lockers or inclosures prepared for the purpose, the height between decks shall be measured from the bottom edge of the carlines, or deck beams, to the upper surface of said lockers or inclosed spaces, which shall be deemed and taken to be the deck or platform from which measurement shall be made for all the purposes of this act, and the spaces occupied by said lockers or inclosed spaces shall be deducted from the spaces allowable for the use of passengers. For example: the spaces in the main and poop decks, or platforms, and in the deck houses, if any there be, will be $16 \times 6 = 96$ feet; lower deck, $18 \times 6 = 108$ feet; two-deck vessels, $14 \times 7\frac{1}{2} = 105$ feet. The encumbering by merchandise or stores, not the personal baggage of the passengers, except in lockers or inclosures prepared for the purpose, of any part of the space occupied by the passengers, will vitiate the whole space, unless the part so encumbered be separated from that so occupied by a substantial bulkhead. The deck or platform must be of a permanent nature, flush, and impervious to the water.

Passport, a warrant of protection and authority to travel, granted to persons moving from place to place by the competent officer. The word appears to be derived from the maritime usage of some Continental countries of giving similar authorities from the admiral of a naval station to vessels leaving harbors within his jurisdiction. As passports are not required in our own country, the only species known to our travelers is that of foreign passports, which, for traveling on the continent of Europe, are usually made out by the resident minister or consul of the country he intends first to visit, or by the State Department. They are subject to *visa*, or inspection, by the proper authorities at the place where the traveler disembarks, and also at other places where he may reach, according to the police regulations of each particular country, and on passing the frontiers of states. Austria is, we believe, the only European state which at this time requires absolutely the *visa* of an embassador or minister of her own for travelers entering her domains by land. In France, and in many Continental countries, home passports are necessary for the native traveler. According to the letter of the French law (since 1796), a Frenchman can not pass the limits of the canton in which he is domiciled without a passport; but in practice it is not required within the extent of the department. Legally speaking, the strict formalities of an internal passport in France require the direction of a journey to be specified, and its exact execution attested by the *visas* and signatures of the police authorities at every place mentioned in it; and these laws are, from their severity, so incapable of complete execution, that it is a common saying that no man but a rogue is ever entirely *en règle* with respect to his passport, suspicious characters being usually the most particular in their attention to formalities, for fear of detention. A Frenchman traveling without a properly-authenticated passport is liable to arrest and detention for a period not exceeding a month. The fees fixed in France are two francs for a passport to travel at home, and ten to go abroad.

By the twenty-first section of the act of August 18, 1856, the Secretary of State of the United States is authorized to grant and issue passports, and cause passports to be granted, issued, and verified in foreign countries by such diplomatic or consular officers of the United States, and under such rules as the President shall designate and prescribe, for and on behalf of the United States, and no other person shall grant, issue, or verify any such passport; nor shall any passport be granted or issued to or verified for any other persons than citizens of the United States; nor shall any charge be made for granting, issuing, or verifying any passport, except in a foreign country; and in any case the fee allowed therefor shall not exceed the sum of one dollar, nor shall any such charge be made for more than one such verification in any foreign country; and if any person acting or claiming to act in any office or capacity under the United States, or any of the States of the United States, who shall not be lawfully authorized so to do, shall grant, issue, or verify any passport, or other instrument in the nature of a passport, to or for any citizen of the United States, or to or for any person claiming to be or designated as such in such passport or verification; or if any consular officer who shall be authorized to grant, issue, or verify passports, shall knowingly and willingly grant, issue, or verify any such passport to or for any person not a citizen of the United States, the person so offending shall be deemed and taken to be guilty of a misdemeanor, and on conviction thereof shall be imprisoned not exceeding one year, or fined in a sum not to exceed five hundred dollars, or both; and may be charged, proceeded against, tried, convicted, and dealt with therefor in the district where he may be arrested or in custody. It is likewise made the duty of all persons who shall be authorized, pursuant to the provisions of the act, to grant, issue, or verify passports, to make return of the same to the Secretary of State; and such returns shall specify the names and all other particulars of the persons to whom the same shall be granted, issued, or verified, as embraced in such passport.

From the foregoing provisions of the act it will be seen that passports can only be issued by the Secretary of State, and such diplomatic and consular officers of the United States in foreign countries as he may expressly authorize, and they can be granted to citizens of the United States only. Passports will be granted by the Secretary of State, and by the diplomatic representatives of the United States in foreign countries, free of charge; but when issued by a consul general or consul, the fee of one dollar, as prescribed in these instructions, is to be collected in every case. As passports granted by the Secretary of State secure to the bearers facilities from foreign governments not accorded to those issued by diplomatic officers, consuls general, or consuls, it will always be to the interest of travelers to procure their passports before leaving the United States, and this course is earnestly recommended by the Department of State. In any country where there is a diplomatic representative of the United States, no consul general or consul is authorized to issue passports, except in the absence of such representative from the place of his legation. Whenever he may be so absent, authority is given to consuls general and consuls only to issue passports; but in all cases the said consuls general or consuls, as the case may be, will report to the Department of State the names of the persons to whom passports have been issued by them, together with the evidence of their being citizens of the United States, and a copy of the same report will be forwarded to the legation of the United States, if there be any in the country. In case there should be no diplomatic representative accredited to the country in which a consul general or consul may reside, then these officers are authorized to grant passports, having regard to the general instructions to consular officers in reference thereto; they will transmit, in all cases, to the Department of State the information in regard to citizenship required by this section.

Whenever a foreign government shall require the *visa* of a passport of any citizen of the United States, it shall be given by the consular officer of the United States at the place where it is demanded, and he shall, for each passport so *visaed*, collect and account for the

fee prescribed in these instructions, noting on the passport that this has been done; and no charge shall thereafter be made by any officer of the United States for any *visa* of that passport in the same country. Passports are granted upon the ground of international courtesy, and as affording evidence to the diplomatic and other agents in foreign countries that the bearer thereof is a citizen of the United States, and entitled to full protection as such. A passport, in proper form, must contain a description of the bearer, with his signature; it must also request all whom it may concern to permit the bearer thereof, being a citizen of the United States, safely and freely to pass, and, in case of need, to give him all lawful aid and protection while so doing. It must be signed by the diplomatic representative, consul general, or consul, and sealed with the seal of the legation or consulate. Consuls general and consuls are expressly instructed that when an application is made for a passport by a native citizen of the United States, before granting it, the applicant must file in the consulate an affidavit stating that fact, and also his age and place of birth; this must be signed and sworn to by himself and one other citizen of the United States named therein, to whom he is personally known, and to the best of whose knowledge and belief the declaration made by him is true. If the applicant be a naturalized citizen, a passport can only be granted upon his exhibiting a certificate of naturalization, or a certified copy thereof; an authenticated copy of which must be transmitted by the consul general or consul to the Department of State. When the applicant is accompanied by his wife, children, or servants, or by females under his protection, it will be sufficient to state the names and ages of such persons and their relationship to the applicant.

UNITED STATES CONSULAR PASSPORT.

CONSULATE OF THE UNITED STATES OF AMERICA.

To all to whom these presents shall come, greeting:

Age, years.
Stature,
Forehead,
Eyes,
Nose,
Mouth,
Chin,
Hair,
Complexion,
Face,

I, the undersigned, consul of the United States of America for ——, and the dependencies thereof, hereby request all whom it may concern, to permit safely and freely to pass, —— ——, a citizen of the United States, and in case of need to give him all lawful aid and protection.

Given under my hand and the seal of the consulate, at ——, this —— day of ——, A.D. 18—, and in the year of the independence of the United States ——.

[SEAL.]

—— ——.

Paste (Fr. *pâte*). In Gem Sculpture, a preparation of glass, calcined crystal, lead, and other ingredients, for imitating gems. This art was well known to the ancients, and, after being long lost, was restored, at the end of the fifteenth century, by a Milanese painter. Some modern artists have succeeded in obtaining a composition possessing a hard, fine, and brilliant lustre or appearance; but *pastes*, or mock diamonds, as they are called, depend most for brilliancy on the art displayed in setting the foil or tinsel behind them. Several recipes have been given by M. Fontanieu; but the most useful, and that generally employed for the production of artificial diamonds, is the following: Take of litharge 20 parts, of silex 12, of nitre 4, of borax 4, and of white arsenic 2 parts. These ingredients are to be well mixed together in a crucible and melted; the fused metal is thrown into water; and should any of the lead employed be reduced to the metallic state, it becomes separated by this process, and the glass is remelted for use. For the finer kinds, rock crystal is used instead of flint or sand, as it occurs in a much purer state; *i. e.*, more free from the admixture of metallic oxyds, which give to vitreous compounds their different colors. In place of the above, Loysel recommends the following ingredients to form a compound having the same specific gravity as the Oriental diamond, and on this account considered superior, as it more nearly approaches the gem with regard to its refractive and dispersive powers; but, like the former, it requires to be kept for some two or three days in a fused state, in order to expel the superabundant alkali and to perfect the refining. A moderate degree of heat fuses it. The following is its composition: Take of white sand purified by being washed, first in muriatic acid and afterward in pure water until all traces of acid are removed, 100 parts; red oxyd of lead (minium) 150 parts; calcined potash 30 to 35 parts; calcined borax 10; and oxyd of arsenic 1 part.—See the *Polytechnic Journal* for July, 1841. The term paste is also applied to the earthy mixture for pottery and porcelain; also to dough, and to the solution of starch or wheat flour, made by first mixing it with a proper portion of cold water, and then adding boiling water under constant stirring, so as to form an even solution. Alum is often added to paste to strengthen it.—BRANDE'S *Dictionary*.

Pastel (Lat. *pastillus*). In painting, a crayon formed with any color and gum water, for painting on paper or parchment. The great defect of this mode of painting is its want of durability.

Patents. A patent, according to the definition of Mr. Philps, is a grant by the State of the exclusive privilege of making, using, and vending, and authorizing others to make, use, and vend, an invention.

The first act of Congress on this subject was passed April 10th, 1790, and it authorized the Secretary of State, the Secretary of War, and the Attorney General, or any two of them, to grant patents for such new inventions and discoveries as they should deem sufficiently useful and important. That act extended equally to aliens, and the board exercised the power of refusing patents for want of novelty or utility. This act was repealed, and a new act passed on the 21st February, 1798. It confined patents to the citizens of the United States, and they were to be granted by the Secretary of State, subject to the revision of the Attorney General. The act gave no power to the Secretary of State to refuse a patent for want of novelty or usefulness, and the granting of the patent became a mere ministerial duty. The privilege of suing out a patent was, by the act of 17th April, 1800, extended to aliens of two years' residence in the United States. The act of July 13th, 1832, only required the alien to be a resident at the time of the application, and to have declared his intention, according to law, to become a citizen.

But as every person was entitled to take out a patent, on complying with the prescribed terms, without any material inquiry, at least at the Patent Office, respecting the usefulness and importance of the invention or improvement, a great many worthless and fraudulent patents were issued, and the value of the privilege was degraded, and in a great degree destroyed. It became necessary to give a new organization to the Patent Office, and to elevate its character, and confer upon it more efficient power. This was done by the act of Congress of July 4th, 1836, which repealed all former laws on the subject, and re-enacted the patent system with essential improvements. A Patent Office is now attached to the Interior Department, and a commissioner of patents appointed. Applications for patents are to be made in writing to the commissioner, by any persons having discovered or invented any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement on any art, machine, manufacture, or composition of matter, not known or used by others before his discovery or invention thereof, and not at the time of his application for a patent in public use or on sale, with his consent or allowance, as the inventor or discoverer. The applicant must deliver a written description of his invention

or discovery, and of the manner and process of making, constructing, using and compounding the same, in full, clear, and exact terms, avoiding unnecessary prolixity, so as to enable any person skilled in the art or science to which it appertains, or is most nearly connected, to make, construct, compound, and use the same; and he must, in the case of a machine, fully explain the principle and the application of it, by which it may be distinguished from other inventions; and he must particularly specify the part, improvement, or combination which he claims as his own invention or discovery. He must accompany the same with drawings and written references, where the nature of the case admits of drawings or specimens of ingredients, and of the composition of matter sufficient in quantity for the purpose of experiment, where the invention or discovery is of a composition of matter. He must likewise furnish a model of his invention, in cases which admit of representation by model. The applicant also must make oath or affirmation that he believes he is the original and first inventor or discoverer of the art, machine, composition, or improvement for which he solicits a patent, and that he does not know or believe that the same was ever before known or used, and he must further state of what country he is a citizen.

If the applicant be a citizen, or an alien of one year's residence, he is to pay to the Treasury of the United States $30; and if a British subject, $500; and all other applicants, $300. The original and true inventor is not to be deprived of the right to a patent for his invention, by reason of his having previously taken out letters patent therefor in a foreign country, and the same having been published at any time within six months next preceding the filing of his specification and drawing. The executors and administrators of persons dying before a patent is taken out, may apply and take it out in trust for the heirs or devisees, on due compliance with the terms of the statute. Patents are assignable, and may be granted in whole or in part by writing, to be recorded in the Patent Office. If invalid by reason of defective specifications, or by claiming too much, the patent may be surrendered, and a new patent taken out for the unexpired period, provided the error did not arise from any fraudulent intention. If the patentee be an alien, he forfeits his exclusive right, if he fails for eighteen months from the date of the patent to continue on sale to the public on reasonable terms the invention or discovery covered by the patent. The patentee does not lose his patent if it satisfactorily appears to the court, that at the time of his application he believed himself to be the first inventor or discoverer of the thing patented, though the invention or discovery, or any part thereof, had been before known or used in a foreign country; provided it does not appear that the same, or any substantial part thereof, had before been patented or described in any printed publication.

These are the principal existing statute provisions on the subject, and though the act of Congress of 1836 has made considerable alterations in the pre-existing laws respecting the organization of the Patent Office, and the limitations on the granting of patents, yet the essential and established doctrines concerning patents heretofore declared in the decisions of the courts remain unaffected. The act of 1793 declared that simply changing the form or the proportions of any machine or composition of matter in any degree was not a discovery. And also, that the person who had discovered an improvement in the principle of any machine, or in the process of any composition of matter, might obtain a patent for such improvement, but that he could not thereby make, use, or vend the original discovery, nor could the first inventor use the improvement. These declaratory provisions are omitted in the law of 1836, and I presume the construction was considered to be necessarily the same without the provision. In an age distinguished for an active and ardent spirit of improvement in the arts of agriculture and manufactures, and in the machinery of every kind applied to their use, the doctrine of patent rights has attracted much discussion, and become a subject of deep interest both here and in Europe.—KENT's *Commentaries*, vol. ii. p. 438; DUNLAP's *Digest Laws U. S.*

Patras, or **Patrasso**, a sea-port in the northwest corner of the Morea, near the entrance of the Gulf of Lepanto, lat. 38° 14′ 25″ N., long. 21° 40′ 20″ E. Population variously estimated from 7000 to 8000. The port lies a little to the northward of the town; but the part fronting it is unsafe, and exposed to heavy seas, particularly in winter. Vessels, therefore, go a little farther up the gulf, where there is a mole or quay, and where they can lie close to the wharf. Patras has a more extensive trade than any other port of Greece. The principal exports are currants, oil, valonia, wine, raw silk, raw cotton, wool, skins, wax, etc. Of these, currants are by far the most important. The fruit is larger, and freer from sand and gravel, than that of the Ionian Islands. They are shipped in casks of various sizes; but as the weight of the cask is included in that of the fruit, it is said to be, for the most part, heavier and stronger than necessary. Morea currants are preferred in most countries, except England; but there the currants of Zante are held in equal, or perhaps greater, estimation. The export of currants from Patras may average from 70,000 to 80,000 cwts. a year; but the produce of the crop varies extremely in different seasons. Latterly the culture of currants in the Morea has been very greatly extended. Owing to the increase of their quantity, their price has been much reduced. But their cultivation would notwithstanding be extremely profitable were it not for the extraordinary risks by which it is attended. It is seldom, indeed, that the entire crop can be housed without serious damage; and very frequently it is all but entirely lost. This was the case with the crop of 1852, the loss of which occasioned much distress. The crops of oil, the next great article of export from Patras, are, if possible, still more fluctuating than those of currants. The imports at Patras, as at the other Greek ports, consist principally of sugar, coffee, and other colonial products; plain and printed cotton stuffs, woolen goods, salted fish, iron, tin plates, hardware, coal, cordage, hemp, deals, etc. Imported articles are brought principally from the Ionian Islands, Malta, Venice, Leghorn, Marseilles, and Trieste; but, from the want of authentic details, it is quite impossible to form any accurate estimate of their amount either as respects Patras or any other Greek port.

Commerce.—The Greeks have particularly distinguished themselves by the spirit and success with which they have engaged in naval and mercantile enterprises. Their commerce, next to their freedom, was the grand source of the prosperity of Athens, Corinth, and other Greek cities of antiquity. And in this respect the modern Greeks have been no unsuccessful imitators of their illustrious progenitors. The great articles of export from Greece consist of currants, silk, figs, wool, olive oil, valonia, wine, sponge, wax, tobacco, etc.; the principal imports being manufactured cotton and woolen goods, corn, with a great variety of subordinate articles, principally from England, but partly also from France and Germany. The mercantile navy of Greece was estimated in 1850 at 4000 vessels, of the aggregate burden of 150,000 tons, employing about 30,000 seamen. The Greeks have, in fact, attained to the distinction of being the carriers, factors, and traders of the Levant.

The advantage resulting to Greece from her being the seat of extensive trade is not so great as might have been anticipated. The import and export trade of the country is subjected to many troublesome regulations; there are no roads, which, however, are less wanted here than in most other countries. Manufactures on a large scale can not be said to exist, the bulk

of the popular'on, but little removed from barbarism, using only those made at home; agriculture is also in the most backward condition, and is almost wholly carried on under the *metayer* system. Still, however, some improvements are taking place, especially in the islands; and it is probable that the progress toward a better state of things will be gradually accelerated. It is deeply to be regretted that Candia, or Crete, was not either added to the new kingdom of Greece, or made independent. We can not help considering it as disgraceful to the Christian nations of Europe, that this famous island, where European civilization first struck its roots, should be consigned to the barbarians by whom it is now laid waste. It is as well entitled to the favorable consideration of England, France, and Russia, as any part of Continental Greece; and we hope that measures may yet be devised for rescuing it from the atrocious despotism by which it has been so long weighed down.—*See* GREECE. For Commerce, etc., of Modern Greece, see *Living Age*, ii. 557; NILES'S *Register*, xxv. 342 (DANIEL WEBSTER'S *Speech*); HUNT'S *Merchants' Magazine*, vii. 109; DE BOW'S *Review*, xiii. 134; *Democratic Review*, viii. 204 (GEORGE SUMNER).

Patterns are specimens or samples of commodities, transmitted by manufacturers to their correspondents, or carried from town to town by travelers, in search of orders.

Pawnbrokers and **Pawnbroking.** A pawnbroker is a species of banker, who advances money, at a certain rate of interest, upon security of goods deposited in his hands; having power to sell the goods, if the principal sum and the interest thereon be not paid within a specified time. The origin of borrowing money by means of pledges deposited with lenders is referred, as a regular trade, to Perousa, in Italy, about A.D. 1458; and soon afterward in England. The business of pawnbrokers was regulated 30 Geo. II., 1756. Licenses were issued 24 Geo. III., 1788. In London there are 334 pawnbrokers; and in England, exclusively of London, 1127.

Advantages and Disadvantages of Pawnbroking.—The practice of impledging or pawning goods, in order to raise loans, is one that must necessarily always exist in civilized societies, and is in many cases productive of advantage to the parties. But it is a practice that is extremely liable to abuse. By far the largest proportion of the *bona fide* borrowers of money on pawn consist of the lowest and most indigent classes; and were the lenders not subjected to any species of regulation, advantage might be taken (as, indeed, it is frequently taken, in despite of every precaution) of their necessities, to subject them to the most grievous extortion. But, besides those whose wants compel them to resort to pawnbrokers, there is another class, who have recourse to them in order to get rid of the property they have unlawfully acquired. Not only, therefore, are pawnbrokers instrumental in relieving the pressing and urgent necessities of the poor, but they may also, even without intending it, become the most efficient allies of thieves and swindlers, by affording them ready and convenient outlets for the disposal of their ill-gotten gains. The policy of giving legislative protection to a business so liable to abuse has been doubted by many. But though it were suppressed by law, it would always really exist. An individual possessed of property which he may neither be able nor willing to dispose of, may be reduced to a state of extreme difficulty; and in such case, what can be more convenient or advantageous for him than to get a loan upon a deposit of such property, under condition that if he repay the loan and the interest upon it within a certain period, the property will be returned? It is said, indeed, that the facilities of raising money in this way foster habits of imprudence; that the first resort for aid to a pawnbroker almost always leads to a second; and that it is impossible so to regulate the business as to prevent the ignorant and the necessitous from being plundered. That this statement, though exaggerated, is to a certain extent true, no one can deny. On the other hand, however, the capacity of obtaining supplies on deposits of goods, by affording the means of meeting pressing exigencies, in so far tends to prevent crime, and to promote the security of property; and it would seem as if the desire to redeem property in pawn would be one of the most powerful motives to industry and economy. At the same time, too, it must be borne in mind that it is not possible, do what you will, to prevent those who are poor and uninstructed from borrowing; and that they must in all cases obtain loans at a great sacrifice, and be liable to be imposed upon. But the fair presumption is, that there is less chance of any improper advantage being taken of them by a licensed pawnbroker than by a private and irresponsible individual. Although, however, the business had all the inconveniences, without any portion whatever of the good which really belongs to it, it would be to no purpose to attempt its suppression. It is visionary to imagine that those who have property will submit to be reduced to the extremity of want, without endeavoring to raise money upon it. Any attempt to put down pawnbroking would merely drive respectable persons from the trade, and throw it entirely into the hands of those who have neither property nor character to lose. And hence the object of a wise Legislature ought not to be to abolish what must always exist, but to endeavor, so far at least as is possible, to free it from abuse, by enacting such regulations as may appear to be best calculated to prevent the ignorant and the unwary from becoming the prey of swindlers, and to facilitate the discovery of stolen property.

Obligations under which Pawnbrokers should be placed.—For this purpose it seems indispensable that the interest charged by pawnbrokers should be limited; that they should be obliged to give a receipt for the articles pledged, and to retain them for a reasonable time before selling them; that the sale, when it does take place, should be by public auction, or in such a way as may give the articles the best chance for being sold at a fair price; and that the excess of price, if there be any, after deducting the amount advanced, and the interest and expenses of sale, should be paid over to the original owner of the goods. To prevent pawnbrokers from becoming the receivers of stolen goods, they should be liable to penalties for making advances to any individual unable to give a satisfactory account of the mode in which he became possessed of the property he is desirous to pawn; the officers of police should at all times have free access to their premises; and they should be obliged carefully to describe and advertise the property they offer for sale.

Law as to Pawnbrokers.—It may appear singular that pawnbrokers should hardly have been named in any legislative enactment till after the middle of last century. It was enacted by the 30 Geo. II. that a *duplicate* or receipt should be given for gooda pawned, and that such as were pawned for any sum less than £10 might be recovered any time within *two* years on payment of the principal and interest; but the rate of interest was not fixed.

Of the pledge of Mortgage and Chattels.—There is a material distinction to be noticed between a pledge and a mortgage. A pledge, or pawn, is a deposit of goods redeemable on certain terms, and either with or without a fixed period of redemption. Delivery accompanies a pledge, and is essential to its validity. The general property does not pass, as in the case of a mortgage, and the pawnee has only a special property. If no time of redemption be fixed by the contract, the pawner may redeem at any time; and though a day of payment be fixed, he may redeem after the day. He has his whole lifetime to redeem, provided the pawnee does not call upon him to redeem, as he has a right to do at any time, in his discretion, if no time for redemption

be fixed; and if no such call be made, the representatives of the pawner may redeem after his death. As early as the time of Glanville, these just and plain principles of the law of pledges were essentially recognised, and it was declared, that if the pledge was not redeemed by the time appointed, the creditor might have recourse to the law, and compel the pawner to redeem by a given day, or be forever foreclosed and barred of his right. And if no time of redemption was fixed, the creditor might call upon the debtor at any time, by legal process, to redeem or lose his pledge. The distinction between a pawn and mortgage of chattels is equally well settled in the English and American law; and a mortgage of goods differs from a pledge and pawn in this, that the former is a conveyance of the title upon condition, and it becomes an absolute interest at law, if not redeemed by a given time, and it may be valid in certain cases without actual delivery. According to the civil law, a pledge could not be sold without judicial sanction, unless there was a special agreement to this effect; and this is, doubtless, the law at this day in most parts of Europe. The French *Civil Code* has adopted the law of Constantine, by which even an agreement at the time of the original contract of loan, that if the debtor did not pay at the day, the pledge should be absolutely forfeited, and become the property of the creditor, was declared to be void. While on this subject of pledges, it may be proper further to observe, that the pawnee, by bill in chancery, may bar the debtor's right of redemption and have the chattels sold. This has been done frequently in the case of stock bonds, plate, or other personal property pledged for the payment of debt. But without any bill to redeem, the creditor, on a pledge or mortgage of chattels, may sell at auction, on giving reasonable opportunity to the debtor to redeem, and apprising him of the time and place of sale; and this is the more convenient and usual practice. While the debtor's right in the pledge remains unextinguished, his interest is liable to be sold on execution; and the purchaser, like any other purchaser or assignee of the interest of the pawner, succeeds to all his rights, and becomes entitled to redeem. —*See* KENT's *Commentaries*, vol. iv.

Italy, France, etc.—The practice of advancing money to the poor, either with or without interest, seems to have been occasionally followed in antiquity.—BECKMANN, vol. iii. But the first public establishments of this sort were founded in Italy, under the name of *Monti di Pietà*, in the 14th and 15th centuries. As it was soon found to be impossible to procure the means of supporting such establishments from voluntary contributions, a bull for allowing interest to be charged upon the loans made to the poor was issued by Leo X. in 1521. These establishments, though differing in many respects, have universally for their object to protect the needy from the risk of being plundered by the irresponsible individuals to whom their necessities might oblige them to resort, by accommodating them with loans on comparatively reasonable terms. And though their practice has not, in all instances, corresponded with the professions they have made, there seems no reason to doubt that they have been, speaking generally, of essential service to the poor. From Italy these establishments have gradually spread over the Continent. The *Mont de Piété*, in Paris, was established by a royal ordinance in 1777; and after being destroyed by the Revolution, was again opened in 1797. In 1804 it obtained a monopoly of the business of pawnbroking in the capital. Loans are made by this establishment upon deposits of such goods as can be preserved, to the amount of two-thirds of the estimated value of all goods other than gold and silver, and to four-fifths of the value of the latter. No loan is for less than 3 francs. The advances are made for a year, but the borrower may renew the engagement. Interest is fixed at the rate of *one* per cent. per month.

The *Mont de Piété* has generally in deposit from 600,000 to 650,000 articles, worth from twelve million to thirteen million francs. The expense of management amounts to from 60 to 65 *centimes* for each article; so that a loan of 3 francs never defrays the expenses it occasions, and the profits are wholly derived from those that exceed 5 francs. At an average the profits amount to about 280,000 francs, of which only about 155,000 are derived from loans upon deposit, about 125,000 being the produce of other funds at the disposal of the company. In some respects, particularly the lowness of interest upon small loans, and the greater vigilance exercised with respect to the reception of stolen goods, the *Mont de Piété* has an advantage over the pawnbroking establishments in this country. It may be doubted, however, whether it is, on the whole, so well fitted to attain its objects. The limitation of the loans to 3 francs would be felt to be a serious grievance here, and it can hardly be otherwise in France; nor is it to be supposed that the servants of a great public establishment will be so ready to assist poor persons, having none but inferior articles to offer in security, as private individuals anxious to get business. And such, in point of fact, is found to be the case, not in Paris only, but in all those parts of the Continent where the business of pawnbroking is confined to a few establishments. And hence, though the question be not free from difficulty, it would seem that, were the modifications already suggested adopted, our system would be the best of any. For further information with respect to this curious and interesting subject, the reader is referred to the *Traité de la Bienfaisance Publique* of Degerando, iii. 1–55; besides giving a succinct historical notice of *Monts de Piété*, the learned author has discussed most part of the knotty questions connected with the proper organization of these establishments, and with their influence on society, with equal sagacity and ability.—See *Bankers' Magazine*, New York, August, 1850, p. 170; August, 1852, p. 124 (Sir F. HEAD); Standard Lib. Cy. London, 1849.

Peach-tree (*Amygdalus persica*). It is not certain in what part of the globe the peach-tree was originally produced; for although we have early accounts of its being brought to Europe from Persia, it does not follow from thence that it was one of the natural productions of that country. Pliny relates that it had been stated to have possessed venomous qualities, and that its fruit was sent into Egypt by the kings of Persia, by way of revenge, to poison the natives; but he treats this story as a mere fable, and considers it the most harmless fruit in the world; that it had the most juice, and the least smell of any fruit, and yet caused thirst to those who ate of it. He expressly states that it was imported by the Romans from Persia; but whether it was indigenous to that country, or sent thither from a region still nearer to the equator, we have no information. He adds that it was not long since peaches were known in Rome, and that there was great difficulty in rearing them. He also informs us that this tree was brought from Egypt to the Isle of Rhodes, where it could never be made to produce fruit; and from thence to Italy. He says, moreover, that it was not a common fruit either in Greece or Natolia. No mention, however, is made of it by Cato. Pownall, in his *Roman Provinces*, makes it a Phocæan importation to Marseilles; and evidently it was cultivated in France at an early period, as Columella, in his account of this fruit, says:

> "Those of small size to ripen make great haste;
> Such as great Gaul bestows, observes due time
> And season, not too early, nor too late."

The peach is said to have been first cultivated in Britain about the middle of the 16th century. Gerard describes several varieties of it as growing in his garden, in 1597. Tusser mentions it in his list of fruits in 1577; and in all probability it was introduced when the Romans had possession of that country.

The peach was introduced into North America by

the first European settlers, probably toward the close of the 16th or early in the 17th century, where it is cultivated in extensive plantations, which often grow with such luxuriance as to resemble forests of other trees. In New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and several other States, much attention is paid to its culture, and the fruit is of an excellent quality. It is no uncommon circumstance for a planter to possess a peach orchard containing one thousand or more of standard trees. It is only in the Middle States of the Union where this fruit arrives at the greatest perfection. In favorable seasons, it matures in the open air as far north as Maine, New Hampshire, Vermont, and the Falls of Niagara; but its pulp is not so delicious as when grown some degrees farther south; it is also trained against walls at Montreal and Toronto, in Canada, where, in some seasons, fruit of a fine quality is obtained. In the Carolinas, Georgia, and Florida, the trees make much foliage and wood; still, if well cultivated and properly pruned, the fruit grows to a large size, and is juicy and well flavored. On the Mississippi, particularly in Louisiana, which lies in the same latitude as that part of Asia where this species is indigenous, it grows spontaneously, but is regarded as of foreign origin, having been introduced from Spain before that river was explored by the French. In the vicinity of Boston, Salem, New York, Philadelphia, and other populous cities of the United States, the peach is reared against walls and in hot-houses by numerous opulent citizens, and fruit of a large size and fine quality is produced. In some other parts of the American continent it also readily grows, and in great abundance. Sir Francis Head, in his *Rough Notes*, speaks in raptures of the beauty and luxuriance of this fruit, which was scattered over the corn-fields in the neighborhood of Mendoza, on the east side of the Andes; and the same traveler noticed dried peaches used as an article of food on the more elevated parts of those mountains, to which they must have been carried from the plains below. On the banks of Rio de la Plata, from Montevideo to Buenos Ayres, we have seen peach-trees growing spontaneously in the greatest perfection, and in such abundance as to form a considerable portion of the fuel of the provinces in which they grew. The fruit there is of a fine quality, large quantities of which are annually dried for domestic use, and the chief part of the remainder is consumed by cattle, or is suffered to decay upon the ground.

The wood of the peach-tree is hard, compact, of a roseate hue, and is susceptible of a fine polish; but owing to its inferior size and comparative scarcity, it is but little used in the arts, or for fuel, except in countries where other kinds of wood are rare. When obtained, however, of suitable dimensions, it may be employed for similar purposes as that of the almond. A color may also be extracted from it called *rose-pink*. Its leaves yield, by distillation, a volatile oil of a yellow color, containing hydrocyanic acid. Its bark, blossoms, and kernels of the fruit, also possess the same poisonous property. From the quantity of gum and sugar contained in the delicious pulp, the peach is nutritious, and is employed as a dessert, both fresh and preserved. From the malic acid contained in its juice, it is slightly refrigerant, and if eaten in moderate quantities it is generally considered as wholesome; but if taken too freely it is liable to disorder the bowels. When stewed with sugar, it may be given as a mild relaxative to convalescents. The kernels may be used for the same purpose as those of the bitter almond. The leaves are sometimes employed by the cook, the liquorist, and the confectioner, for flavoring, and they have also been substituted for Chinese tea; but, as fatal consequences have sometimes followed these uses, they should be looked upon with precaution. The preservation of peaches, plums, cherries, apricots, and other kinds of fruit in sirup occupies a prominent rank in the industry and commerce of France and Majorca, and doubtless could be profitably carried on in those parts of the United States where these fruits are cultivated in abundance. To those who are desirous of entering into the business on an extensive scale, we would recommend the *Nouveau Manuel du Limonadier, du Glacier, du Chocolatier, et du Confiseur, par* MM. Cardelli, Lionnet-Clémandot, et Julia de Fontenelle, published at Paris in 1838; or, what would be still better, the employment of an intelligent *confiseur* who is practically acquainted with all its manipulations.—Browne's *Trees of America*.

Peak, a name given to the upper corner of those sails which are extended by a gaff, or by a yard which crosses the mast obliquely, as the mizzen-yard of a ship, the main-yard of a bylander, etc. The upper extremity of these yards and gaffs is also denominated the *peak*.

Pear-tree (*Pyrus Communis*). The common pear-tree is indigenous to Europe, Western Asia, the Himalayas, and to China; but not to Africa nor America. It is found wild in most of the counties of Britain, as far north as Forfarshire; on the continent of Europe, from Sweden to the Mediterranean; and in Asia, as far east as China and Japan. It is always found on a dry soil, and more frequently on plains than on hills or mountains; and solitary, or in small groups, rather than in woods and forests. The varieties cultivated for their fruit succeed both in the temperate and transition zones of the two hemispheres, and it has been remarked that this tree, as well as the apple and the cherry, will grow in the open air wherever the oak will thrive.

The wood of the common pear-tree is heavy, strong, compact, of a fine grain, and slightly tinged with red. In common with that of all the Rosaceæ, it is liable to have its natural color changed by steeping in water, which, therefore, ought to be avoided when intended for particular purposes in the arts. When green, it weighs nearly eighty pounds to a cubic foot, and from forty-nine to fifty-three pounds when dry. According to Du Hamel, it is, next to the true service (*Pyrus sorbus*), the best wood that can be employed in wood-engraving, for which purpose, however, it is far inferior to that of the box. Yet it is allowed to be very hard and homogeneous, easy to cut, and, when perfectly dry, is not liable either to crack or warp. For the coarser kinds of engraving, such as large plans or diagrams, show-bills, etc., it serves a very good purpose. When it can be obtained, in Europe, it is much used by turners and pattern-makers; also for joiners' tools; and, as it can readily be stained, it is sometimes made into various articles, dyed black, in imitation of ebony. As fuel, the wood of this tree is excellent, producing a vivid and durable flame, accompanied by an intense heat. According to Withering, the leaves afford a yellow dye, and may be employed to impart a greenish shade to blue cloths. But the most important uses of the pear-tree are those which arise from its fruit. When ripe, it is employed at the table as a dessert, either raw, stewed, or preserved in sirup, and occasionally it is used in tarts. In most of the countries where it grows this fruit is very generally dried in ovens, or in the sun, in which state, when stewed, it is excellent, either as a substitute for puddings and pies, or as forming part of the dessert.

Another purpose to which the pear is applied is for making perry. It is extensively cultivated for this object in various parts of Britain, France, and Germany, where the trees are sometimes planted in rows eighteen or twenty yards apart, in order to admit a free access of light and air. Perry is made in the same manner as cider. The pears should be gathered before they begin to fall, and should be ground as soon after as possible. Should the perry not be sufficiently clear, when racked off, it may be fined in the usual manner of clarifying cider, by isinglass, in the proportion of about half an ounce to a barrel. The kinds of pears

used for making this liquor in Herefordshire are such as have an austere juice, as the "Squash," the "Old-field," the "Barland," the "Huff-cap," the "Sack," the "Red," and the "Longland" varieties. Pears were considered by the Romans as an antidote to the effect of eating poisonous mushrooms; and up to the present time perry is said to be the best remedy that can be employed for the same purpose. In Britain and France an agreeable wine is made from a mixture of crab-apples and pears, which in the latter country is called *piquette*. Pears, in general, produce flatulency, and consequently are unfit for weak stomachs; but when they are quite ripe, and contain a sweet juice, they seldom prove noxious, unless eaten to excess. Pears that are to be kept for winter use should hang as long on the trees as the state of the weather will admit. They should then be kept in heaps, in an open, dry situation, for about ten days, then wiped with a dry woolen cloth, and, lastly, packed up close from the air and moisture. But to keep the fruit in its greatest perfection, small earthen jars may be selected about the size of the pear, which should be packed separately, in clean oat chaff or wheaten bran, then tied down with oiled paper or skin, and cemented tight with wax or pitch. These jars should then be packed in a cask, chest, or some other secure place, with their bottoms upward, where they should remain until required for use.—BROWNE'S *Trees of America*.

Pearl-ash. *See* POTASH.

Pearls (Du. *Paarlen*; Fr. *Perles*; Ger. *Perlen*; It. *Perle*; Lat. *Margaritæ*; Russ. *Shemptschug, Perlü*; Sp. *Perlas*; Arab. *Looloo*; Cyng. *Mootoo*; Hind. *Mootie*), are well-known globular concretions found in several species of shell-fish, but particularly the mother-of-pearl oyster (*Concha margaritifera*, Linn.). Pearls should be chosen round, of a bright, translucent, silvery whiteness, free from stains and roughness. Having these qualities, the largest are of course the most valuable. The larger ones have frequently the shape of a pear; and when these are otherwise perfect, they are in great demand for ear-rings. Ceylon pearls are most esteemed in England. The formation of the pearl has embarrassed both ancient and modern naturalists to explain, and has given occasion to a number of vain and absurd hypotheses. M. Réaumur, in 1717, alleged that pearls are formed like other stones in animals. An ancient pearl was valued by Pliny at £80,000 sterling. One which was brought, in 1574, to Philip II., of the size of a pigeon's egg, was valued at 14,400 ducats, equal to £13,996. A pearl spoken of by Boetius, named the *Incomparable*, weighed thirty carats, equal to five pennyweights, and was about the size of a muscadine pear. The pearl mentioned by Tavernier as being in possession of the Emperor of Persia was purchased of an Arab in 1633, and is valued at a sum equal to £110,400.—HAYDN.

Value of Pearls.—Pearls were in the highest possible estimation in ancient Rome, and bore an enormous price. *Principium culmenque omnium rerum pretii, margaritæ tenent.*—PLINY, *Hist. Nat.* Their price in modern times has very much declined; partly, no doubt, from changes of manners and fashions, but more probably from the admirable imitations of pearls that may be obtained at a very low price. According to Mr. Milburn, a handsome necklace of Ceylon pearls, smaller than a large pea, costs from £170 to £300; but one of pearls about the size of peppercorns may be had for £15. The pearls in the former sell at a guinea each, and those in the latter at about 1*s.* 6*d.* When the pearls dwindle to the size of small shot, they are denominated *seed* pearls, and are of little value. They are mostly sent to China. One of the most remarkable pearls of which we have any authentic account was bought by Tavernier at Catifa, in Arabia, a fishery famous in the days of Pliny, for the enormous sum of £110,000! It is pear-shaped, regular, and without blemish. The diameter is ·63 inch at the largest part, and the length from two to three inches. Much difference of opinion has existed among naturalists with respect to the production of pearls in the oyster; but it seems now to be generally believed that it is the result of disease, and is formed in the same manner as bezoar (*see* BEZOAR), pearls, like it, consisting of successive coats spread with perfect regularity round a foreign *nucleus*. In fact, the Chinese throw into a species of shell-fish (*mytilus cygneus*, or swan muscle), when it opens, five or six very minute mother-of-pearl beads strung on a thread; and in the course of a year they are found covered with a pearly crust, which perfectly resembles the real pearl.—MILBURN'S *Oriental Commerce*; AINSLIE'S *Materia Indica*.

Pearl Fisheries.—The pearl oyster is fished in various parts of the world, particularly on the west coast of Ceylon; at Tuticoreen, in the province of Tinnevelley, on the coast of Coromandel; at the Bahrein Islands, in the Gulf of Persia; at the Sooloo Islands; off the coast of Algiers; off St. Margarita, or Pearl Islands, in the West Indies, and other places on the coast of Colombia; and in the Bay of Panama, in the South Sea. Pearls have sometimes been found on the Scotch coast, and in various other places. The pearl fishery of Tuticoreen is monopolized by the East India Company, and that of Ceylon by government. But these monopolies are of no value; as in neither case does the sum for which the fishery is let equal the expenses incurred in guarding, surveying, and managing the banks. It is, therefore, sufficiently obvious that this system ought to be abolished, and every one allowed to fish on paying a moderate license duty. The fear of exhausting the banks is quite ludicrous. The fishery would be abandoned as unprofitable long before the breed of oysters had been injuriously diminished; and in a few years it would be as productive as ever. Besides giving fresh life to the fishery, the abolition of the monopoly would put an end to some very oppressive regulations enacted by the Dutch more than a century ago.

Persian Gulf.—The most extensive pearl fisheries are those on the several banks not far distant from the island of Bahrein, on the west side of the Persian Gulf, in lat. 26° 50′ N., long. 51° 10′ E.; but pearl oysters are found along the whole of the Arabian coast, and round almost all the islands of the Gulf. Such as are fished in the sea near the islands of Karrak and Corgo contain pearls said to be of a superior color and description. They are formed of eight layers or folds, while others have only five, but the water is too deep to make fishing for them either very profitable or easy. Besides, the entire monopoly of the fishery is in the hands of the Sheik of Bushire, who seems to consider these islands as his immediate property. "The fishing season is divided into two portions—the one called the short and cold, the other the long and hot. In the cooler weather of the month of June, diving is practiced along the coast in shallow water; but it is not until the intensely hot months of July, August, and September, that the Bahrein banks are much frequented. The water on them is about seven fathoms deep, and the divers are much inconvenienced when it is cold; indeed, they can do little when it is not as warm as the air, and it frequently becomes even more so in the hottest months of the summer. When they dive, they compress the nostrils tightly with a small piece of horn, which keeps the water out, and stuff their ears with beeswax for the same purpose. They attach a net to their waists, to contain the oysters; and aid their descent by means of a stone, which they hold by a rope attached to a boat, and shake it when they wish to be drawn up. From what I could learn, two minutes may be considered as rather above the average time of their remaining under water. Although severe labor, and very exhausting at the time, diving is not considered particularly injurious to the constitution; even old men practice it. A person

usually dives from twelve to fifteen times a day in favorable weather; but when otherwise, three or four times only. The work is performed on an empty stomach. When the diver becomes fatigued, he goes to sleep, and does not eat until he has slept some time. At Bahrein alone the annual amount produced by the pearl fishery may be reckoned at from £200,000 to £240,000. If to this the purchases made by the Bahrein merchants or agents at Aboottabee Sharga, Ras-ul Khymack, etc., be added, which may amount to half as much more, there will be a total of about £300,000 or £360,000; but this is calculated to include the whole pearl trade of the Gulf; for it is believed that all the principal merchants of India, Arabia, and Persia who deal in pearls make their purchases, through agents, at Bahrein. I have not admitted in the above estimate much more than *one-sixth* of the amount some native merchants have stated it to be, as a good deal seemed to be matter of guess or opinion, and it is difficult to get at facts. My own estimate is in some measure checked by the estimated profits of the small boats. But even the sum which I have estimated is an enormous annual value for an article found in other parts of the world as well as here, and which is never used in its best and most valuable state except as an ornament. Large quantities of the seed pearls are used throughout Asia in the composition of majoons, or electuaries, to form which all kinds of precious stones are occasionally mixed, after being pounded, excepting, indeed, diamonds; these being considered, from their hardness, as utterly indigestible. The majoon in which there is a large quantity of pearls, is much sought for and valued, on account of its supposed stimulating and restorative qualities. The Bahrein pearl fishery boats are reckoned to amount to about 1500, and the trade is in the hands of merchants, some of whom possess considerable capital. They bear hard on the producers or fishers, and even those who make the greatest exertions in diving, hardly have food to eat. The merchant advances some money to the fishermen at cent. per cent., and a portion of dates, rice, and other necessary articles, all at the supplier's own price; he also lets a boat to them, for which he gets one share of the gross profits of all that is fished; and, finally, he purchases the pearls nearly at his own price, for the unhappy fishermen are generally in his debt, and therefore at his mercy."—*Manuscript Notes communicated by Major* D. Wilson, *late political Resident at Bushire.*

The fishery at Algiers was farmed by an English association in 1826, but we are ignorant of their success. The pearl fisheries on the coast of Colombia were at one time of very great value. In 1587 upward of 697 lbs. of pearls are said to have been imported into Seville. Philip II. had one from St. Margarita which weighed 250 carats, and was valued at 150,000 dollars. But for many years past the Colombian pearl fisheries have been of comparatively little importance. During the mania for joint-stock companies, in 1825, two were formed; one, on a large scale, for prosecuting the pearl fishery on the coast of Colombia; and another, on a smaller scale, for prosecuting it in the Bay of Panama and the Pacific. Both were abandoned in 1826. The best fishery ground is said to be in from six to eight fathoms water. The divers continue under water from a minute to a minute and a half, or at most two minutes. They have a sack or bag fastened to the neck, in which they bring up the oysters. The exertion is extremely violent; and the divers are unhealthy and short-lived.—For further information, *see* Hunt's *Merchants' Magazine*, xviii. 565.

Pearl shells, commonly called *Mother-of-pearl shells*, are imported from various parts of the East, and consist principally of the shells of the pearl oyster from the Gulf of Persia and other places, particularly the Sooloo Islands, situate between Borneo and the Philippines the shores of which afford the largest and finest shells hitherto discovered. On the inside the shell is beautifully polished, and of the whiteness and water of pearl itself: it has the same lustre on the outside, after the external lamina have been removed. Mother-of-pearl shells are extensively used in the arts, particularly in inlaid work, and in the manufacture of handles for knives, buttons, toys, snuff-boxes, etc. The Chinese manufacture them into beads, fish, counters, spoons, etc.; giving them a finish to which European artists have not been able to attain. Shells for the European market should be chosen of the largest size, of a beautiful pearly lustre, thick and even, and free from stains. Reject such as are small, cracked or broken, or have lumps on them. When stowed loose as dunnage, they are sometimes allowed to pass free of freight.—Milburn's *Oriental Commerce*. The Imports during the three years ending with 1842 amounted, at an average, to about 950,000 lbs. a year.

Artificial Pearls.—These are small globules or pear-shaped spheroids of thin glass, perforated with two opposite holes, through which they are strung, and mounted into necklaces, etc., like real pearl ornaments. They must not only be white and brilliant, but exhibit the iridescent reflections of mother-of-pearl. The liquor employed to imitate the pearly lustre is called the *essence of the East* (*essence d' Orient*), which is prepared by throwing into water of ammonia the brilliant scales, or rather the *lamellæ*, separated by washing and friction, of the scales of a small river fish, the blay, called in French *ablette*. These scales digested in ammonia, having acquired a degree of softness and flexibility which allow of their application to the inner surfaces of the glass globules, they are introduced by suction of the liquor containing them in suspension. The ammonia is volatilized in the act of drying the globules. It is said that some manufacturers employ ammonia merely to prevent the alteration of the scales; that when they wish to make use of them, they suspend them in a well-clarified solution of isinglass, then pour a drop of the mixture into each bead, and spread it round the inner surface. It is doubtful whether, by this method, the same lustre and play of colors can be obtained as by the former. It seems, moreover, to be of importance for the success of the imitation, that the globules be formed of a bluish, opalescent, very thin glass, containing but little potash and oxyd of lead. In every manufactory of artificial pearls there must be some workmen possessed of great experience and dexterity. The French are supposed to excel in this ingenious branch of industry. False pearls were invented in the time of Catherine de Medicis, by a person of the name of Jaquin. They are made of small globules of glass, blown by the ordinary lamp. The pearly lustre is communicated by introducing by means of a blow-pipe a small quantity of nacreous substances obtained from the surface of the scale of a small fish very common in the Seine and the Rhine, and also in the Thames. This substance preserved with sal ammoniac in a liquid state is commonly sold under the name of "Oriental essence." After having covered the inside of the pearl with this liquid, a coating of wax is added, which is colored to the required shade. The manufacture of pearls is principally carried on in the department of the Seine in France. There are also manufactories in Germany and Italy, but to a small extent. In Germany, or rather Saxony, a cheap but inferior quality is manufactured. The globe of glass forming the pearl in inferior ones being very thin, and coated with wax, they break on the slightest pressure. They are known by the name of German fish pearls. Italy also manufactures pearls by a method borrowed from the Chinese; they are known under the name of Roman pearls, and a very good imitation of natural ones: they have on their outside a coating of the nacreous liquid. The Chinese pearls are made of a kind of gum, and are covered likewise with the same liquid. In the year

1684 a French artisan discovered an opaline glass of a nacreous or pearly color, very heavy and fusible, which gave to the beads the different weights and varied forms found among real pearls; gum instead of wax is now used to fill them; by which they attain a high degree of transparency, and the glassy appearance has been lately obviated by the use of the vapor of hydro-fluoric acid. This acts in such a manner as to deaden the surface, and remove its otherwise glaring look.—URE's *Dictionary*.

Peas (Ger. *Erbsen*; Fr. *Pois*; It. *Piselli, Bisi*; Sp. *Pesoles, Guisantes*; Russ. *Gorooch*). The pea is one of the most esteemed of the leguminous or pulse plants. There are many varieties; but the common garden pea (*Pisum sativum*), and the common gray or field pea (*Pisum arvense*), are the most generally cultivated; being reared in large quantities in all parts of the country. But since the introduction of the drill husbandry, the culture of the pea as a field-crop has been to a considerable extent superseded by the bean. Sometimes, however, it is drilled along with the latter; for, being a climbing plant, it attaches itself to the bean, so as to admit the ground being hoed, at the same time that the free admission of air about its roots promotes its growth. It is not possible to frame any estimate of the consumption of peas. The field pea is now hardly ever manufactured into meal for the purpose of being made into bread, as was formerly the case in many parts of the country; but there is reason to think that the garden pea is now more extensively used than ever. —LOUDON's *Encyclopedia of Agriculture*; BROWN on *Rural Affairs*.

Various kinds of pulse, from the facility with which they are produced in almost every country of the globe, and the highly nutritive properties which they usually possess, have been a favorite food for man and animals among all nations, and in every age of the world. Thus we find that the Athenians employed sodden beans in their feasts dedicated to Apollo, and that the Romans presented them as an oblation in their solemn sacrifice called *Fabaria*. Pliny informs us that they offered bean-meal cakes to certain gods and goddesses in these ancient rites and ceremonies; and Lempriere states that bacon was added to beans in the offerings to Cama, not so much to gratify the palate of that goddess as to represent the simplicity of their ancestors. The bean came originally from the East, and was cultivated in Egypt and Barbary in the earliest ages of which we have any records. It was brought into Spain and Portugal in the early part of the eighth century, whence some of the best varieties were introduced into other parts of Europe, and finally into the United States. The first beans introduced from Europe into the British North American colonies were by Captain Gosnold, in 1602, who planted them on the Elizabeth Islands, near the coast of Massachusetts, where they flourished well. They were also cultivated in Newfoundland as early as 1622; in New Netherlands in 1644; and in Virginia prior to 1648. French, Indian, or kidney beans were extensively cultivated by the Indians of New York and New England long before their settlement by the whites; and both beans and peas (calavances), of various hues, were cultivated by the natives of Virginia prior to the first landing of Captain John Smith. Among these were embraced the celebrated cow-pea (*Phaseolus*), or Indian pea, at present so extensively cultivated at the South for feeding stock, as well as for the purposes of making into fodder, and for plowing under, like clover, as a fallow crop.

The varieties of beans at present cultivated in the United States, as field and garden crops, are too numerous to admit of repetition in this report. For field culture, the common small white, the red-eyed China, the turtle-soup, the Mohawk, and the refugee are preferred; for garden culture, the Mohawk, the early six-weeks, the early Valentine, the yellow six-weeks, the black Valentine, the royal white kidney, the Carolina, or Sewee, the cranberry, the London horticultural, and the Dutch case-knife. The yield usually varies from thirty to sixty bushels per acre, weighing sixty-three pounds to the bushel. The common pea is supposed to have been indigenous to the South of Europe, and was cultivated both by the Greeks and Romans. Its introduction into the British North American colonies probably dates back to the early periods of their settlement by Europeans, as it is enumerated in several instances among the cultivated products of this country by our early historians. The cultivation of the pea as a field crop is principally confined to the Middle, Eastern, and Western States, the varieties of which are distinguished as the early and the late ripening. The early varieties are generally small and dark-colored, among which the gray and grass are the most common. The yield varies from twenty-five to forty bushels per acre, weighing sixty-four pounds to the bushel. The marrow-fats are among the richest of the field peas, which are much preferred for good lands. The small yellow are thought to be best for poorer soils. A very prolific "bush pea" is cultivated in the Southern States, bearing pods six or seven inches in length, which hang in clusters, and are filled with fine white peas, much esteemed for the table, either green or dry. The amount of peas exported from Savannah in 1755 was 400 bushels; in 1770, 601 bushels; from Charleston, in 1754, 9162 bushels; from North Carolina, in 1755, 10,000 bushels; annually from Virginia, before the Revolution, 5000 bushels; annually from the United States, twenty years preceding 1817, 90,000 bushels. The amount of beans annually exported during the last-named period, from 30,000 to 40,000 bushels.—*Patent Office Report*.

Peat, a well-known inflammable substance, employed in many parts of the world as fuel. There are two species of peat. The first is a yellowish brown or black peat, found in moorish grounds in Scotland, Holland, and Germany. When fresh, it is of a viscid consistence, but hardens by exposure to the air. It consists, according to Kirwan, of clay mixed with calcareous earth and pyrites; sometimes, also, it contains common salt. While soft, it is formed into oblong pieces for fuel, after the pyritaceous and stony matters are separated from it. By distillation, it yields water, acid, oil, and volatile alkali, the ashes containing a small proportion of fixed alkali, and being either white or red, according to the proportion of pyrites contained in the substance. The oil which is obtained from peat has a very pungent taste, and an empyreumatic smell, less fetid than that of animal substances, but more so than that of mineral bitumens. It congeals in the cold into a pitchy mass, which liquefies in a small heat; it readily catches fire from a candle, but burns less vehemently than other oils, and immediately goes out upon removing the external flame; and in rectified spirit of wine it dissolves almost totally into a dark, brownish red liquor. The second species is found near Newbury, in Berkshire. In the *Philosophical Transactions* for the year 1757, we have an account of this species, the substance of which is as follows: Peat is a composition of the branches, twigs, leaves, and roots of trees, with grass, straw, plants, and weeds, which having lain long in water, is formed into a mass soft enough to be cut through with a sharp spade. The color is a blackish brown, and it is used in many places for fuel. There is a stratum of this peat on each side of the Kennet, near Newbury, in Berks, which is from about a quarter to half a mile in width, and many miles in length. The depth below the surface of the ground is from one foot to eight. Great numbers of entire trees are found lying irregularly in the true peat. These are chiefly oaks, alders, willows, and firs, and appear to have been torn up by the roots; many horses' heads, and bones of several kinds of deer, the horns of the antelope, the heads and tusks of boars, and the heads of beavers, are also found imbedded in it.

Peck, a dry measure for grain, pulse, etc. The standard, or imperial peck, contains two gallons, or 554·55 cubic inches. Four pecks make a bushel, and four bushels a coomb.—*See* WEIGHTS and MEASURES.

Peculation, the term, in the Roman law, for the embezzlement of public money belonging either to the government or to communities. Under *peculation*, also, was comprised the adulteration of gold, silver, or any metal belonging to government. Connected with it, by a law of the dictator, Cæsar, were the *crimen de residuis* (if a person had received public money for a particular purpose, and did not apply it for the same), and the *sacrilegium* (the theft or misappropriation of money or other things sacred to a god). In most governments the embezzlement of public money by public officers is severely punished. Peculation and treason were, by the French charter of 1814, the only crimes for which a minister was impeachable.—E. A.

Pellitory, the root of a perennial plant (*Anthemis pyrethrum*), a native of the Levant, Barbary, and the south of Europe. The root is long, tapering, about the thickness of the finger, with a brownish cuticle. It is imported packed in bales, sometimes mixed with other roots, from which, however, it is easily distinguished. It is inodorous. When chewed, it seems at first to be insipid, but after a few seconds it excites a glowing heat, and a pricking sensation on the tongue and lips, which remains for 10 or 12 minutes. The pieces break with a short, resinous fracture; the transverse section presenting a thick, brown bark, studded with black, shining points, and a pale yellow radiated inside. It is used in medicine as a stimulant.—THOMSON'S *Dispensatory*.

Peltry is the name given to the skins of different kinds of wild animals found in high northern latitudes, particularly in North America, such as the beaver, sable, wolf, bear, etc. When the skins of such animals have received no preparation they are termed *peltry*; but when the inner side has been tanned by an aluminous process they are denominated *furs*.

Pencils (Ger. *Pinsel*; Du. *Pinseelen*; Fr. *Pinceaux*; It. *Pennelli*; Sp. *Pinceles*). The word pencil is used in two senses. It signifies either a small hair brush employed by painters in oil and water colors—they are of various kinds, and made of various materials, some being formed of the bristles of the boar and others of camel's hair, the down of swans, etc.—or a slender cylinder, of black-lead or plumbago, either naked or inclosed in a wooden case, for drawing black lines upon paper. The last sort, which is the one to be considered here, corresponds nearly to the French term *crayon*, though this includes also pencils made of differently-colored earthy compositions. The best black-lead pencils of this country are formed of slender parallelopipeds, cut out by a saw from sound pieces of plumbago, which have been previously calcined in close vessels at a bright red heat. These parallelopipeds are generally inclosed in cases made of cedar wood, though of late years they are also used alone, in peculiar pencil-cases, under the name of ever-pointed pencils, provided with an iron wire and screw, to protrude a minute portion of the plumbago beyond the tubular metallic case, in proportion as it is wanted.

Pendant, or **Pennant**, a sort of long and narrow banner displayed from the mast-head of a ship-of-war, and usually terminating in two ends or points, called the *swallow's tail*. It denotes that the vessel is in actual service. *Broad pendant* is a kind of flag terminating in one or two points, used to distinguish the chief of a squadron. *Pendant* is also a short piece of rope, fixed on each side, under the shrouds, upon the heads of the main and foremasts.

Penknives (Germ. *Federmesser*; Fr. *Canifs*; It. *Temperini*; Sp. *Corta plumas*), small knives, too well known to need any particular description, used in making and mending pens. The best penknives are manufactured in London and Sheffield.

Pennsylvania, one of the central United States, lies between 39° 43′ and 42° N. lat., and between 74° and 80° 40′ W. long. It is 307 miles long and 160 broad, containing 47,000 square miles. Population in 1700 was 434,373; in 1800, 602,545; in 1810, 810,091; in 1820, 1,049,313; in 1830, 1,347,672; in 1840, 1,724,033; and in 1850, 2,311,786. The Alleghany Mountains cross the State from southwest to northeast, and there are many smaller ranges on each side of the principal ridge and parallel to it. The southeastern and northwestern parts of the State are either level or moderately hilly. The soil is generally fertile, and much of it is of a superior quality; the best land on the southeast is on both sides of the Susquehanna. Between the head-waters of the Alleghany and Lake Erie the soil is very fertile. The anthracite coal region is immense. The Mauch Chunk, Schuylkill, and Lyken's Valley coal-field extends from the Lehigh River across the head-waters of the Schuylkill, and is 65 miles in length, with an average breadth of five miles. The Lackawanna coal-field extends from Carbondale, on the Lackawannock, to 10 miles below Wilkesbarre, on the Susquehanna. The Shamokin field has been less explored. Iron ore exists in nearly every county, and in the vicinity of Pittsburgh vast quantities are manufactured. Beds of copper and lead exist, and quarries of marble and building-stone abound. There are in the south part valuable mineral springs. There were in the State, in 1850, 8,628,619 acres of improved and 6,294,728 acres of unimproved land in farms; cash value of farms, $407,876,099; and the value of implements and machinery, $14,722,541. *Live Stock.*—Horses, 350,898; asses and mules, 2259; milch cows, 530,224; working oxen, 61,527; other cattle, 562,195; sheep, 1,822,357; swine, 1,040,366; total value of live stock, $41,500,053.

Early History of Pennsylvania.—The territory of this State was, before the year 1681, for the greater part comprised under the name *Northern Virginia*, and after 1616 under the name of *New England*. When Penn, in the year 1681, obtained from Charles II. a grant of a great tract of land, between 40° and 42° N. lat., he himself wished to give to it the name of *New Wales*; but the king, against Penn's wish, called it, in honor of Penn, *Pennsylvania*. The name is to be found for the first time in the King's charter of the 4th of March, of the year 1681. In the year 1682 Penn, desirous of approaching his province to the sea-coast, bought from the Duke of York the whole tract of land and settlements along the west side of Delaware Bay, the so-called *three lower counties*. This tract of land remained, however, in connection with Pennsylvania only until the year 1776, when the inhabitants of these lands declared themselves independent and founded the State of Delaware. By this the State of Pennsylvania was again excluded from the sea-coasts, and as a nearly entirely inland State the history of its limits is not of a great interest for our hydrographical researches.—J. G. KOHL.

The Delaware River washes the entire eastern border of the State, and is navigable for ships to Philadelphia. The Lehigh, after a course of 75 miles, enters it at Easton. The Schuylkill, 130 miles long, unites with it six miles below Philadelphia. The Susquehanna is a large river, which rises in New York, flows south through this State, and enters the Chesapeake Bay in Maryland. It is much obstructed by falls and rapids. The Juniata rises among the Alleghany Mountains, and, after a course of 160 miles, enters the Susquehanna 11 miles above Harrisburg. The Alleghany River, 400 miles long, from the north, and the Monongahela, 300 miles long, unite at Pittsburgh, and form the Ohio. The Youghiogheny is a small river which flows into the Monongahela.

Agricultural Products.—Wheat, 15,367,691 bushels; rye, 4,805,160 bushels; Indian corn, 19,835,214 bushels; oats, 21,538,156 bushels; barley, 165,584 bushels;

buckwheat, 2,193,602 bushels; peas and beans, 55,231 bushels; potatoes, 5,980,752 bushels; sweet potatoes, 52,172 bushels. Value of products of the orchard, $723,589; produce of market gardens, $688,714. Pounds of butter made, 39,878,418; of cheese, 2,505,084; maple sugar, 2,526,525; molasses, 50,652 gallons; beeswax and honey, 850,509 pounds; wool, pounds produced, 4,481,570; flax, 530,807; silk cocoons, 285; hops, 22,088; tobacco, 012,651; hay, tons of, 1,842,970; hemp, 44 tons; clover seeds, 125,030 bushels; other grass seeds, 58,913 bushels; flax seed, 41,728 bushels; and were made, 25,590 gallons of wine. Value of home-made manufactures, $749,132; value of slaughtered animals, $8,219,848.—*Census Report*, 1850.

Manufactures.—There were in the State in 1850, 136 cotton factories, with a capital invested of $4,671,015, employing 4283 males and 4374 females, producing 59,532,000 yards of sheeting, etc.; 5,808,561 pounds of yarn, valued at $5,812,126; 254 woolen factories, with a capital invested of $1,776,268, employing 1747 males and 753 females, manufacturing articles valued at $2,703,409; 178 establishments making pig iron, with a capital invested of $8,357,525, employing 9264 persons, producing 322,752 tons pig iron, etc., valued at $6,170,625; 320 establishments, with a capital of $3,422,924, employing 4783 persons, and making 57,810 tons of castings, etc., valued at $5,354,881; 131 establishments, with a capital of $7,620,066, employing 6771 persons, manufacturing 182,506 tons of wrought iron, valued at $8,902,907; 2380 flouring and grist mills, 2936 saw mills, 1540 tanneries; 103 printing-offices, 328 newspapers, 25 daily, three tri-weekly, one semi-weekly, 275 weekly, eight semi-monthly, 12 monthly, and two quarterly publications. Capital invested in manufactures, $91,463,210; value of manufactured articles, $154,944,698.

Canals.—The State of Pennsylvania as early as the year 1791 initiated a system of inland water communication. William Penn, it is said, first conceived the idea. In 1792 two companies were formed, to build the Schuylkill and Susquehanna, and Delaware and Schuylkill canals. They constructed fifteen miles and abandoned the work. In 1821 the enterprise was renewed, and completed in 1827, when other works were started, and nearly all the present canals authorized and their routes surveyed. The State has now 848 miles of canals, which cost $24,168,000, according to an estimate considered to be under rather than above the mark. Private companies have built 485 miles of canal, costing $21,955,000. The State has therefore 1333 miles of canal, costing upward of $46,000,000. Besides these it has 2164 miles of railroad, which cost some $58,000,000. The totals of these important improvements added together, make 3497 miles, and their cost foots up $104,000,000. Their value to the State is not represented by their cost, for without them Pennsylvania would be a wilderness. They unite her to the Great West, to the southern part of our State, and to the great metropolis; and enable her to send her coal and iron to distant marts, enriching her beyond estimate.

The following is presented as a comparison of the anthracite coal trade of Pennsylvania for two years:

	1855.	1856.
	Tons.	Tons.
Reading Railroad	2,218,392	2,143,903
Schuylkill Navigation Co.	1,105,263	1,169,286
Pine Grove	165 656	170,154
Little Schuylkill	427,250	454,514
Lehigh	1,274,986	1,302,883
Lackawanna	1,059,595	1,167,013
Wyoming	559,000	519,000
Shamokin	122,500	126,500
Lyken's Valley	112,000	100,000
Scranton	....	50,000
Total	6,926,283	7,258,891

FOREIGN COMMERCE OF THE STATE OF PENNSYLVANIA FROM OCTOBER 1, 1820, to JULY 1, 1856, SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851.

Years ending	Exports.			Imports.	Tonnage cleared.		District Tonnage.

* Nine months to June 30, and fiscal year begins July 1, 1843.

Philadelphia, near the confluence of the rivers Delaware and Schuylkill, in lat. 39° 57′ N., long. 75° 10′ W., and near the head of the Delaware Bay. Vessels of the largest burden ascend the river as far as Newcastle, but those drawing above 18 or 20 feet of water can not reach Philadelphia, on account of a bar a little below the city. The entrance to the magnificent bay formed by the embouchure of the Delaware has Cape May on the north, and Cape Henlopen on its south side. The commerce of Philadelphia has not kept pace with her growth in other respects, especially in manufactures. The tonnage in 1856 was 197,228 tons.—*See* PHILADELPHIA.

Erie, port of entry, is beautifully situated on Presque Isle Bay, on Lake Erie, or rather one mile square, and has one of the best harbors on the lake, the channel or entrance to which has lately been much improved; the water is from 11 to 20 feet deep, and the largest steamboats enter without difficulty. There is a light-house on the west side of the entrance of Presque Isle Bay, lat. 42° 8′ 14″ N.; shows a fixed light, elevated 93 feet above the surface of the lake, and visible for a distance of 14½ miles. The beacon is on the east side of the bay; visible 8¾ miles.—For further information of the commerce and resources of Pennsylvania, *see Bankers' Magazine*, New York, 1851–1856; *North American Review*, xlii. 241 (C. CUSHING); HUNT's *Merchants' Magazine*, x. 808, xii. 237; DE BOW's *Review*, xii. 476. *See also articles* DELAWARE RIVER—COAL—CANALS and RAILROADS.

Penny, formerly a silver, but now a copper coin. This was the first silver coin struck in England by our Saxon ancestors, being the 240th part of their pound; so that its weight was about 22½ grains Troy. Camden derives the word from the Latin, *pecunia*, money. The ancient English penny, penig, or pening, was the first silver coin struck in England, nay, the only one current among our Saxon ancestors, as is agreed by Camden, Spelman, Hickes, and others. The penny was equal in weight to our threepence; five of them made one shilling or scilling Saxon, and 80 a mark or mancuse, equal to 7*s.* 6*d.* Till the time of King Edward the First, the penny was struck with a cross, so deeply indented into it that it might be easily broken, and parted, on occasion, into two parts, which were thence called *half-pennies*, or into *four*, which were called *fourthings*, or *farthings*. But that prince coined it without indenture, instead of which he first struck round halfpence and farthings. He also reduced the weight of a penny to a standard, ordering that it should weigh 32 grains of wheat, taken out of the middle of the ear. This penny was called the penny *sterling;* and, as 20 of these pence were to weigh an ounce, the penny thus became a weight as well as a coin. The penny sterling was long disused as a coin, and was scarcely known, except as a money of account, containing the twelfth part of a shilling; but latterly it has been introduced into the British current coin.—*See* POST-OFFICE.

To ascertain the, as yet unknown, quality of the metal in the old British penny, the chief assayers in Philadelphia were addressed, to procure information from books of reference or actual assay. The answer decided: "The ancients intended fine silver and pure gold in their coins, refined them as well as they could, and issued them for fine metal. But the old silver pennies of Britain are now so few and expensive—one in the mint collection cost seven dollars—we can not afford to assay them." As this point was essential for accurate calculation, Mr. DuBois added, in a postscript, "Since writing the above I have assayed a silver penny of William the Conqueror. It gives a fineness of ·956 thousandths, and contains gold equal to ·009¼ thousandths." This trial shows an alloy of some base metal exceeding ·040 thousandths (·040⅛) contained in the silver penny, diminishing its standard in that degree from that of perfect purity. "The Mint remedy" of the United States, regarded to be a necessary allowance for casual deviations in the quality of silver pieces, can not exceed ·008 thousandths, instead of ·040, on each side the standard. It is not now proposed at mints to have the coins of the highest quality, but the rule or standard of purity, ordered by law, must be exact, both in fine metal and alloy. By recent proof with wheat corn measure, the weight of the old penny *may* have varied from five grains in the red to eight grains in the white wheat. The modern "allowance" for variation in quantity is one-fourth or one-half a grain, in a coin approaching the value of the Anglo-Norman penny. The silver penny of old time—the only money except rings known to the native Britons—was at once a coin, a weight, and a measure. Its character of purity checked and ruled the values of all moneys, weights, and measures represented by or deduced from it. Such values do not depend solely on weight nor solely upon fineness, but on their combined powers, the product of both. The keystone of the so-called "system" of 1266 was conceived to be "*the weight* of the silver penny sterling." But *defective quality* caused this "keystone" to crumble. The superstructure erected upon such foundation failed, because metallurgical irregularity was *not* checked by metrical exactness. The measures were faulty throughout—"weighed in the balances, they were *both* found wanting." The bases for calculation in this ancient scale being inaccurate, no truth could be elicited by any increase of numbers—or quantities in progression. Some of the silver pennies of the early Britons were nearly divided by the impression of a cross, through the middle on the reverse, so they could be broken into half-pennies, and again into quarters, called "fourthings," or farthings. This practice of simple division had continued until silver half-pennies and farthings were specially coined by King John, in 1185—*first* in Ireland, where his principal Mint was. During the latter part of the reign of Henry the Third, of England, "a penny" of fine gold was ordered of the value of twenty pennies of silver. The word "penny" had its derivation from the French "denier," the "denarius" of the Latins. The French title, shortened into "denny" by the Normans, was easily changed on the English tongue to "penny"—at that time a common term for money in general, of whatever metal it might be. Golden deniers, coined sparingly in France, bearing the figure of a lamb, were called deniers d'agneau, or moutons d'or. During the reigns of the early Norman kings, their rents, though reserved in money, were answered in cattle, corn, and other provisions, because money was then scarce among the people. Coins of gold, named "nobles d'or," were first issued from the British Mint by Edward the Third, in 1344; but with so much difficulty that it was thought necessary to order by law, "no one should be *obliged* to receive them." It was decided to prove the standard of the silver penny of our remote ancestry, by the approval of English and other contemporaries, in wheat corn grains from "the Old North State of Carolina." Six different growths of the crop of 1856, intended for seed and consumption, selected in October from two prominent varieties, the red and the white, choosing grains of average quality, but perfect fullness, were antagonized by a penny-weight Troy of the purest silver, specially prepared from solution, for assays of gold. No two samples of thirty-two wheat corn grains were found of the same weight. Of early red—May wheat—from thirty-eight to forty and forty-three corns were required to balance the silver piece, while of white wheat from twenty-eight to thirty-five and thirty-six grains effected the same purpose, showing a disproportion equal to fifteen wheat grains in the six parcels; that is, from twenty-eight to forty-three corns—a deviation in the value of a silver penny equivalent to nearly one half the standard weight. An act of Henry the Third, in 1266, explains the primitive initials of these ancient British, Gallic, and German standards, to all which one common deri-

vation is imputed. "By consent of the whole realm, the measure of the king was made, that is to say, an English penny of silver, called a sterling, round, and without any clipping, shall weigh thirty-two wheat corns, taken from the middle of the ear. And twenty pence of silver do make one ounce. And twelve ounces of silver do make one pound. And eight pounds of silver do make a gallon of wine. And eight gallons of wine do make a London bushel, which is the eighth part of a quarter." This general arrangement for money weights and measures was that of the Eastern nations, by which Europe had been overrun. The term "easterlin" of the Norman French was transmuted on the English tongue, first to "easterling," and finally to "sterling."—*Report of Dr.* J. H. GIBBON, United States Mint, North Carolina. *See* POUND.

Penny-Post. First set up in London and its suburbs by a Mr. Murray, upholsterer, A.D. 1681. Mr. Murray afterward assigned his interest in the undertaking to Mr. Dockwra, a merchant, 1683; but on a trial at the King's Bench bar in the reign of Charles II., was adjudged to belong to the Duke of York as a branch of the general post, and was thereupon annexed to the revenue of the crown.—DELAUNE, 1690. This institution was considerably improved in and round London, July, 1794, *et seq.*, and was made a twopenny-post. A penny-post was first set up in Dublin in 1774.—*See* POST-OFFICE.

Pennyweight, a Troy weight, containing twenty-four grains, each grain weighing a grain of wheat, gathered out of the middle of the ear and well dried. The name took its rise from the circumstance that this was anciently the weight of one of our silver pennies.

Pens (Fr. *Plumes à écrire*; Ger. *Schreibfedern*; It. *Penne da Scrivere*; Russ. *Pera Stwoli*), well-known instruments for writing, usually formed of the quills of the goose, swan, or some other bird. Metallic pens have been occasionally employed for a lengthened period; but it is only within these few years that they have been extensively introduced. They are now, however, manufactured in vast quantities, and of an immense variety of forms. But though they have superseded to a very considerable extent the use of quills, and have some peculiar advantages, it does not appear possible to give them the elasticity of the quill, nor to fit them so well for quick and easy writing on common descriptions of paper. Quills are said to have been first used for pens in A.D. 553; but some say not before 635. Quills are for the most part plucked with great cruelty from living geese; and all persons, from convenience, economy, and feeling, ought to prefer metallic pens, which came into use in 1830.—PHILLIPS.

For the manufacture of steel pens the best metal, made from Dannemora or hoop (I.) iron, is selected and laminated into slips about three feet long and four inches broad, of a thickness corresponding to the desired stiffness and flexibility of the pens. These slips are subjected to the action of a stamping-press, somewhat similar to that for making buttons. The point destined for the nib is next introduced into an appropriate gauged hole of a little machine, and pressed into the semi-cylindrical shape; where it is also pierced with the middle slit, and the lateral ones, provided the latter are to be given. The pens are now cleaned, by being tossed about among each other, in a tin cylinder, about three feet long, and nine inches in diameter; which is suspended at each end upon joints to two cranks, formed one on each of two shafts. The cylinder, by the rotation of a fly-wheel, acting upon the crank-shafts, is made to describe such revolutions as agitate the pens in all directions, and polish them by mutual attrition. In the course of four hours several thousand pens may be finished upon this machine. When steel pens have been punched out of the softened sheet of steel by the appropriate tool, fashioned in the desired form, and hardened by ignition in an oven and sudden quenching in cold water, they are best tempered by being heated to the requisite spring elasticity in an oil bath. The heat of this bath is usually judged of by the appearance to the eye; but this point should be correctly determined by a thermometer, according to the scale; and then the pens would acquire a definite degree of flexibility or stiffness, adapted to the wants and wishes of the consumers. They are at present tempered too often at random.

IMPORTS OF METALLIC PENS INTO THE UNITED STATES FOR THE FISCAL YEAR ENDING JUNE 30, 1856.

France	2,029
New Granada	76
Total value	$116,165

Pepper (Fr. *Poivre*; Ger. *Pfeffer*; Du. *Peper*; It. *Pepe*; Sp. *Pimienta*; Russ. *Perez*; Lat. *Piper*), the berry or fruit of different species of plants, having an aromatic, extremely hot, pungent taste, used in seasoning, etc. The following sorts of pepper are met with in commerce: *Black Pepper* (Fr. *Poivre*; Ger. *Schwarzen pfeffer*; It. *Pepe negro*; Sp. *Pimienta*; Sans. *Mercha*; Hind. *Gol-mirch*; Malay, *Lada*; Jav. *Marika*), the fruit of a creeping plant (*Piper nigrum*), one of the pepper genus, of which there are upward of 80 species. It is cultivated extensively in India, Siam, the Eastern islands, etc. It requires the support of other trees, to which it readily adheres. It climbs to the height of 20 feet, but is said to bear best when restrained to the height of 12 feet. It begins to produce at about the third year, and is in perfection at the seventh; continues in this state for three or four years; and declines for about as many more, until it ceases to be worth keeping. The fruit grows abundantly from all the branches, in long small clusters of from 20 to 50 grains; when ripe, it is of a bright red color. After being gathered, it is spread on mats in the sun, when it loses its red color, and becomes black and shriveled as we see it. The grains are separated from the stalks by hand rubbing. That which has been gathered at the proper period shrivels the least; but if plucked too soon, it will become broken and dusty in its removal from place to place. The vine produces two crops in the year; but the seasons are subject to great irregularities. Pepper should be chosen of a pungent aromatic odor, an extremely hot and acrid taste, in large grains, firm, sound, and with few wrinkles—for of these it always has some. Reject that which is shriveled, or small grained, or which on being rubbed will break to pieces. In point of quality, the pepper of Malabar is usually reckoned the best; but there is no material difference between it and that of Sumatra, and the other islands. In the market of Bengal, where they meet on equal terms, the produce of Malabar is generally about two per cent. higher than the other. In Europe there is generally a difference of ½*d.* per lb. in favor of Malabar; but in China they are held in equal estimation. Black pepper sold ground is said to be often adulterated with burned crust of bread.

White Pepper is made by blanching the finest grains of the common black pepper by steeping them for a while in water, and then gently rubbing them, so as to remove the dark outer coat. It is milder than the other, and is much prized by the Chinese; but very little is imported into England.

Cayenne Pepper is the produce of several varieties of the *Capsicum*, an annual plant, a native of both the Indies. The best is brought from the West Indies ready prepared, and is made from the *Capsicum baccatum* (bird pepper). It has an aromatic, extremely pungent, acrimonious taste, settling the mouth, as it were, on fire, and the impression remaining long on the palate. It is sometimes adulterated with muriate of soda; and sometimes with a very deleterious substance, the red oxyd of lead; but this fraud may be detected by its weight, and by chemical tests.

Long Pepper.—This species is the produce of a peren-

nial (*Piper longum*), a native of Malabar and Bengal. The fruit is hottest in its immature state, and is therefore gathered while green, and dried in the sun. It is imported in entire spikes, which are about one and a half inch long. It has a weak aromatic odor, an intensely fiery, pungent taste, and a dark gray color. The root of long pepper is a favorite medicine among the Hindoos. The quantities of the last three species of pepper imported are quite inconsiderable.—Milburn's *Oriental Commerce*; Ainslie's *Materia Indica*; Thomson's *Dispensatory*, etc.

Trade in Pepper.—Pepper is extensively used, all over Europe and the East, as a condiment. It was originally imported into England by way of the Levant; and for many years after the establishment of the East India Company it formed the most important article of their imports. In nothing has the beneficial effect of opening the Indian trade been so unequivocally displayed as in the instance of pepper. The private traders have resorted to new markets, and discovered new sources of supply, which had hitherto been wholly unexplored; so that there has been not only a very great increase in the quantity of pepper brought to market, but also a very great fall in its price, which does not now exceed a third part of what it amounted to in 1814!

Supply of Pepper.—The following instructive details with respect to the supply of pepper are taken from the *Singapore Chronicle*, to which they were contributed by John Crawfurd, Esq., than whom there can be no more competent authority as to such subjects. Of all the products of the Eastern islands, and of the countries immediately in their neighborhood, in demand among strangers, black pepper is the most important, both in value and quantity. The pepper countries extend from about the long. of 96° to that of 115° E., beyond which no pepper is to be found; and they reach from 5° S. lat. to about 12° N., where it again ceases. Within these limits we have Sumatra, Borneo, the Malayan peninsula, and certain countries lying on the east coast of the Gulf of Siam. The whole produce of the island of Sumatra is estimated not to fall short of 168,000 piculs of 133⅓ lbs. each; the southwest coast being said to produce 150,000, and the northeast coast 18,000 piculs. The pepper ports on the northeast coast of Sumatra are Lankat and Delli, with Sardang. The first two produce 15,000 piculs, and the latter 3000 annually. The cultivation is carried on by the Batta nation in the interior. The ports on the southwest coast, and the amount of their produce, as given in a recent estimate, are as follows: viz., port and district of Trumah, 40,000; district of Pulo Dua, 4000; ditto of Ciuat, 30,000; coast from Tampat Tuan to Susu, 33,000; port of Susu, 1000; Kualla Batta, 20,000; Analabu, 2000; districts to the north of Analabu, 20,000; making in all, 150,000 piculs. Here it is of importance to remark that the culture and production are extremely fluctuating. During the last pepper season, there obtained cargoes on the west coast of Sumatra, 27 American ships, six country traders, four large French ships, besides the ships belonging to the East India Company, which generally take away 500 tons. Nearly the whole of this trade is in the hands of Europeans or Americans; the pepper finds its way to Europe, to America, and in a small proportion to China. The northeast coast of Sumatra, from Pedier down to the Carimons, is estimated, as already mentioned, to produce 18,000 piculs. Prince of Wales Island is the principal *dépôt* for this, from whence the greatest part is exported to India and China. The produce of Prince of Wales Island itself is about 15,000 piculs. Of the islands at the mouth of the Straits of Malacca and Singapore, Bingtang, on which Rhio is situated, and adjacent islands, produce 10,000 piculs; and Lingga about 2000. A large proportion of this is brought to Singapore, which exported last year about 21,000 piculs; some part to Bengal and China, but principally to Europe direct, in free traders. The west coast of the Malayan peninsula produces no pepper, with the exception of about 4000 piculs afforded by the territory of Malacca. On the east coast of the peninsula, the production of pepper is very considerable. The ports of Patani and Calantan—chiefly the latter—yield about 16,000 piculs annually, and Tringanu about 8000. A portion of this is brought to Singapore and Penang; but we believe the greater proportion goes direct to China in junks, of which three large ones frequent Tringanu annually, and one Calantan. The Americans, too, occasionally visit these ports. In the year 1821, three vessels of considerable burden obtained cargoes. The east coast of the Gulf of Siam, from the lat. of 10½° to that of 12½° N., affords an extensive produce of pepper. This coast is scarcely known, even by name, to the traders of Europe. The principal ports here are Chantibun, Tungyai, Pongsom, and Kampop—the first two being under the dominion of Siam, and the latter under that of Kamboja. The whole produce is estimated at not less than 60,000 piculs; 40,000 of which are brought at once to the capital of Siam as tribute to the king, and the whole finds its way to China in junks. It remains only to estimate the produce of the island of Borneo. The whole produce of Borneo is estimated at about 20,000 piculs; of which a large share is carried to China direct in junks, some by Portuguese vessels; and about 7000 piculs are now annually brought by the native craft of the country itself to Singapore in the course of that free trade which is happily flourishing at this settlement. The data which have been stated will enable us to estimate the whole production of the Malayan Archipelago, including that of the peninsula of Malacca, and that of the east coast of the Gulf of Siam, at 308,000 piculs; and as there is no other part of the world that affords pepper, excepting the western coast of the peninsula of India, and this affords but 30,000 piculs, or less than one-tenth part of what the places we have enumerated produce, we have, accordingly, at one view the whole production of the earth, being 338,000 piculs, or 45,066,666 lbs. avoirdupois. The average price of pepper has been lately about nine Spanish dollars a picul; so that the whole value drawn into India from Europe, China, and the New World, on account of this single commodity, is 3,042,000 dollars. The quantity given in this statement may appear enormous; but if meted out to the whole population of the globe, or to 1,000,000,000 of people, it would be found that the average annual consumption of an individual would amount to no more than 323 grains. Mr. Crawfurd has more recently supplied a revised estimate of the annual production of pepper as follows:

	Pounds.
Sumatra (west coast)	20,000,000
" (east coast)	8,000,000
Islands in the Straits of Malacca	5,000,000
Malay peninsula	3,733,333
Borneo	2,666,667
Siam	8,000,000
Malabar	4,000,000
Total	50,000,000

Perch, or **Rod**, a long measure, 16½ feet in length.—*See* WEIGHTS and MEASURES.

Perfume (Fr. *parfum*), a term used to denote the volatile effluvia from any body affecting the organ of smelling, or the substance emitting those effluvia. Perfumes were in general use among the ancients (see the *Quarterly Review*, vol. xxiii.); and in France, Germany, Spain, and Portugal, and even, though not to so considerable an extent, in England, they are regarded almost as necessaries. In general they are made of musk, ambergris, civet, rose, and cedar woods, orange flowers, jessamines, jonquils, tuberoses, and other odoriferous flowers. Aromatic drugs, such as storax, frankincense, benzoin, cloves, etc., enter into the composition of a perfume; and many perfumes are composed of aromatic herbs or leaves, as lavender, marjoram, sage, thyme, etc.

Perfumery. Many of the wares coming under this name were known to the ancients, and the Scriptures abound with instances of the use of incenses and perfumes. No such trade as a perfumer was known in Scotland in 1763.—CHEECH. A stamp tax was laid on various articles of perfumery in England, and the vender was obliged to take out a license, in 1786. At the corner of Beaufort Buildings, in the Strand, resided Lilly the perfumer, mentioned in the *Spectator*.—LEIGH.

Some of the most exquisite of perfumes are obtained from the most offensive substances. In olden times the most delicate perfumes were distilled from flowers, whose names they bore; but chemistry has shown how to obtain them from other sources. To give one example, a peculiarly fetid oil, called fusel-oil, is formed during the making of brandy and whisky. Now this loathsome oil, by a particular mode of treatment, is made to yield the fragrant *oil of pears*; by another process, *oil of apples*; and by others, *oil of grapes* and *oil of cognac*. The *oil of pine-apples* is produced from sugar and putrid cheese. The *oil of bitter almonds* is a resultant from aquafortis and the offensive oils from gas tar. The dainty *eau de mille fleurs* is made from the drainage of cow-houses. And in all these cases, there is not the same kind of fraud which is practiced in ordinary adulterations; for though the perfumes are not actually, in the present state of things, produced from the flowers and fruits which give them their names, yet they are really identical, or nearly so, in chemical composition with the original perfumes; nature mixes the ingredients in one case, man in the other, but the ingredients are the same. The passion for perfumes is increasing. British India and Europe consume about 150,000 gallons of handkerchief odors yearly; and the English revenue from *eau de Cologne* is about 8000 pounds sterling a year. The total revenue from imported perfumes in England is estimated at about £40,000 sterling per annum. The largest revenues of the estates on the borders of the Mediterranean are those which proceed from the sale of the orange blossoms and Parma violets. The house of Fagner, 83 Rue de Richelieu, and many of the other perfumers of Paris, pay a yearly sum, varying from 10 to 30,000 francs, to the proprietors, for their whole crop of orange blossoms or violets. The *fleurs de citriconnier of Fagner* is one of the favorite and most delightful odors used for scenting the pocket handkerchief.

Periodical Publications. These, as the name implies, are publications which appear at fixed periods or stated intervals, and consequently include newspapers, monthly and other magazines, quarterly reviews, and journals, and all such books as appear at monthly or other intervals. But the term "periodical publications" is usually understood in a more confined sense, or as comprising only magazines and such political, literary, and scientific journals as appear at regular intervals, without including newspapers or works published in parts. Even when thus restricted, this is a very extensive and important department of literature. No doubt a vast deal of trash gets into print by the agency of magazines that might not otherwise see the light; but most part of these publications contain at the same time some superior articles; and a few are ably conducted and embrace a wide range of topics. Since the establishment of the *Edinburgh Review* in 1802, the quarterly journals, especially those that embrace politics and literature, have risen to great eminence, and have had a powerful influence over the public mind. At present, however, and for some time past, the influence of this class of journals has been declining. An ably conducted daily paper is, at this moment, by far the most powerful engine the press can bring into the field.—*See* NEWSPAPERS. For further information refer to *American Almanac*, 1835, p. 97, 256, 1836, p. 92; *North American Review*, xxxix. 277 (J. G. PALFREY); *Southern Literary Messenger*, ii. 393; *Westminster Review*, i. 206, ii. 463; *Edinburgh Review*, xxxviii. 349; *American Quarterly Observer*, iii. 135.

Pernambuco Province. This is one of the most important provinces in Brazil. It abounds with many good harbors, and possesses an exceedingly fertile soil. Its chief staples are sugar, cotton, and hides. Of these its average annual exports from 1840 to 1845 were as follows: Sugar, 34,177 tons; cotton, 32,279 bags (160 lbs. each); hides, 72,500. The city of Pernambuco maintains the third rank in the empire. There are in this province about six hundred "engenhos," or sugar estates, each covering about one square league. On each engenho are produced annually about fifty cases of white, and five of brown, or muscovado sugar,—or forty tons of the former, and four and a half tons of the latter—equal to about 24,000 tons of white, and 2550 tons of brown, for the whole province. The province is estimated to be capable of yielding 396,800 tons of white, and 40,800 tons of muscovado sugar. Imports from the United States consist chiefly of cotton domestics. Fabrics of this kind, thirty yards in length, and twenty-seven to twenty-eight inches in width, are in demand, and bring much better prices than similar goods from England. Of late years the manufacturers of Lancashire have imitated these cloths, and have succeeded in sharing the advantages which the American article had secured. In printed cottons Manchester and Glasgow almost monopolize the markets of Pernambuco. The quality as well as the cheapness of their goods have secured this privilege. The importation of butter, hitherto almost exclusively in the hands of the French, might be advantageously shared by the citizens of the United States.

In 1840 the French imported			.....	4160 firkins.
" 1841	"	"	.....	5549 "

" 1843	"	"	.....	7981 "
" 1844	"	"	.....	8062 "
In 1840 were imported from Great Britain				4437 "
" 1841	"		"	3889 "
" 1842	"		"	3240 "
" 1843	"		"	4032 "
" 1844	"		"	3616 "

The production of cotton has diminished, owing mainly to the expense attending its transportation to market; but the production of sugar has increased. From 1828 to 1831, the average annual export was 1,607,389 arrobas, and in the years 1841 to 1844 it was augmented to 2,083,212 arrobas; being an annual increase of 475,823 arrobas, or 6797$\frac{33}{72}$ tons. The number of hides exported during the two periods of four years above-named increased in a still greater ratio than sugar. From 1828 to 1831 the annual average export was 60,272 hides; and during the latter four years, from 1841 to 1844, the same average augmented to 122,573 hides per annum; showing an annual increase of 62,301 hides. It has already been observed that if the export duty levied upon the produce of Brazil transmitted to foreign parts were modified or repealed, a vast augmentation in agricultural productions would unquestionably follow. While an export duty of ten per cent. on the weekly average price of

sugar continues, and a similar duty on cotton, coffee, tobacco, rum, hides, and, with one or two unimportant exceptions, on all other articles produced in the country, the producing interests must remain crippled, and expectations either continue to be stationary or decrease. The cotton and sugar-growing districts suffer most under these heavy taxes upon their industry and capital. The planters are obliged to carry cotton and sugar to Pernambuco by horse conveyance, a distance of from twenty to one hundred leagues, during the dry season, when food and water are difficult to be obtained. These charges are such, in addition to those imposed by law, that when the planter reaches market his cotton hardly yields him net four cents per lb. And so with his sugar, and all other heavy produce.

The navigation and trade of Pernambuco in 1845 stood as follows: Inward from all nations—Vessels, 242; tonnage, 49,796; value of cargoes, $4,136,075. Of which from the United States: Vessels, 35; tonnage, 6117; value of cargoes, $602,075. Outward to all nations — Vessels, 226; tonnage, 48,539; value of cargoes, $4,567,870. Of which to the United States: Vessels, 19; tonnage, 3216; value of cargoes, $283,460. During the year 1845 two United States vessels went south with cargoes; two were sold, and four remained in port. This will, to a certain extent, account for the difference between the values of imports and exports to and from the United States, as above shown.

The vessels from the United States imported as follows:

Cottons	1018	packages.
Silks	3	"
Woolens and silks	1	"
Flour	24,913	barrels.
Do.	648	half-barrels.

And on return voyage home, exported—

Sugar	9,104 barrels.
Do.	23,410 bags.

Total quantity of sugar produced and entered in the market of Pernambuco in the years 1844 and 1845:

In 1844	Arrobas,	2,146,688 = Pounds,	68,694,027
In 1845	"	2,465,824 = "	78,906,371

Of which were sent, in 1845, to the United States, 184,417 arrobas 26 lbs. = (at 32 lbs. to arroba) 5,901,344 lbs.

Hides.—Total number exported to all countries: In 1844, 124,074; in 1845, 163,935. Of which to the United States, 10,888.

TOTAL EXPORTS OF COTTON, SUGAR, AND HIDES FROM PERNAMBUCO FROM 1828 TO 1845, BOTH INCLUSIVE.

Years.	Cotton.	Sugar	Hides.
	Bags	Arrobas.	Number.
1828	70,785	1,460,628	52,444
1829	54,820	1,463,332	46,573
1830	61,151	1,705,614	65,489
1831	53,157	1,100,084	76,584
1832	31,520	1,518,300	66,656
1833	58,564	1,301,412	84,743
1834	42,799	854,088	80,350
1835	52,142	1,588,848	91,492
1836	62,834	1,823,292	90,701
1837	43,847	1,454,420	93,771
1838	00,648	1,750,380	105,851
1839	89,173	1,878,675	111,052
1840	95,849	2,191,008	132,993
1841	26,990	2,261,699	136,494
1842	21,857	1,906,936	126,206
1843	35,906	2,017,522	104,428
1844	41,385	2,146,688	124,074
1845	26,562	2,565,824	163,935

Number of vessels to and from the United States in Pernambuco in 1846: Vessels, 117, of 30,801 tons.

VALUE OF IMPORTS FROM AND EXPORTS TO ALL COUNTRIES.

		1845.	1846.
Imports	Francs,	24,567,000	17,136,000
Exports	"	20,327,000	19,851,000

Value of imports and exports from the United States in 1845: Imports, 1,928,000 francs; exports, 641,000 francs; total, 2,569,000 francs.

PRODUCTS EXPORTED TO ALL COUNTRIES IN 1846, COMPARED WITH 1847, IN FRANCS.

Years.	Sugar.	Hides.	Cotton	Tafia
1846	15,107,000	2,750,000	1,055,000	644,000
1847	17,478,000	1,124,000	1,836,000	82,000

From the preceding table it will be seen that the market at Pernambuco was more brisk in 1847 than during the preceding year. Sugar is the leading article in this market, and is exported to England, Trieste, Genoa, Portugal, the north of Europe, and to the United States. The total exports of sugar from Brazil are thus distributed throughout the ports of the empire. The exports for 1846 are taken as a basis for calculation:

	Kilo.	Pounds
Bahia	62,447,000	137,383,400
Pernambuco	40,570,000	89,254,000
Rio de Janeiro	8,244,000	9,892,800
Total kilo and pounds.	111,261,000	236,530,200

EXPORT OF SUGAR FROM PERNAMBUCO FROM 1852 TO 1854.

Exported to	1851-'52.	1852-'53	1853-'54
	Tons.	Tons	Tons
Great Britain	14,838	15,006	18,505

Brazilian ports	5,274	5,510	6,003
Total	47,956	64,829	50,549

The sugar produced in the province of Pernambuco amounts to about 80,000 tons a year, of which 60,000 are exported to foreign countries, 5000 coastwise, and 15,000 are retained for home consumption. There are about 1000 engenhos or sugar estates, 257 of which have been established within the last ten years. They average in extent about two square miles, and their crops vary from 200 tons as a maximum to 30 as a minimum; or at an average of about 75 tons each. Very few engenhos possess 150 slaves, and the smallest not more than 10 or 12; the average number of slaves employed on each engenho is about 50, so that 50,000 may be said to be her employed in sugar cultivation. They are badly treated and hard worked.

Pernambuco has many of the privileges of a sovereign state; it has its own president, provincial and municipal chambers, levies a portion of its own taxes, and maintains a militia which can not be removed from the province. It sends four senators and fifteen representatives to the imperial government — elected, the former for life, and the latter for four years, by almost universal but indirect suffrage. The imperial revenue levied within the province in 1849-'50 amounted to £542,423; in 1850-'51 to £690,526; and as these sums are derived chiefly from imports and exports, and no additional duties have been imposed, the increase is a proof of its commercial prosperity. The details of the latter year's general revenue were as follows:

Duties upon imports	£426,105
Duties upon exports	61,705
Port charges	7,183
Post-office, crown lands, etc	34,737
Extraordinaries	1,066
Deposits for charities, restitution unclaimed estates	3,573
Remittance of funds to the imperial treasury	155,354
Total	£690,526

In 1841 the receipt of imperial taxes from the province of Pernambuco amounted to only £278,852 11*s.* 2*d.*; so that in the course of ten years it has nearly trebled. Provincial taxes are levied upon sugar, coffee, tobacco, cattle, horses, spirits, passports, licenses for potteries, saw-mills, cigar shops, auctions, etc.; upon houses, legacies, inheritances, slaves, the tolls of bridges, etc., etc. Total amount in 1850-'51, £173,997 5*s.* The municipal

taxes are derived from the stamping of weights and measures, licenses to public houses, and places of entertainment, etc. They amounted in 1850–'51 to 123,650 reals, or £12,506 11*s.* 3*d.*, making the total taxation of the province as follows:

Imperial taxes	£690,526
Provincial	173,997
Municipal	12,506
Total	£877,030

Of these sums nearly two-thirds are expended by the imperial government; and to this is chiefly to be attributed the many attempts which have been made by Pernambuco to free herself from the imperial connection; and if the weight of a country's taxation may be judged of by its relation to the number of its inhabitants, the province of Pernambuco is as heavily taxed as most European states. The population of the province of Pernambuco amounted, according to the last census, to 606,936; of these 143,102 are white, and 463,834 colored; viz., 4078 Indians, 322,685 mulattoes, and 137,071 blacks. 506,702 were free, and 106,234 are slaves; 315,749 males, and 291,157 females. But the population must have increased considerably of late years.

Pernambuco, a city and sea-port of Brazil, inferior only to Rio Janeiro and Bahia in commercial importance; capital of the province of its own name, on the Atlantic, at the mouth of the Capaharibe, 210 miles northeast from Bahia; latitude of light-house, 8° 3 25″ S.; longitude, 34° 52′ W. Population estimated in 1852 at 100,000. It consists of the separate towns of Olinda, Recife, Boa-Vista, and St. Antonio; the first of which is on the main land, and the others lie south from it on a succession of low sandy banks, separated by salt-water creeks and different arms of the river, but connected with each other by two bridges. Recife, or Pernambuco proper, the most southerly, about four miles southwest from Olinda, is defended by the principal forts, and comprises the dock-yard and the large merchants' warehouses. In St. Antonio are the governor's palace, formerly the Jesuits' convent; the treasury, town-hall, prison, barracks, with convents, churches, and several good squares. A long embankment connects this town with the main land. Boa-Vista is extensive, but irregularly laid out; it has one handsome street, and comprises the residences of many of the richer inhabitants of the city, with gardens, various churches and convents, etc. Olinda, though beautifully situated, is in a state of decay, having been deserted by many of its population for Recife and the other parts of the city. The harbor of Pernambuco is defended from the swell of the ocean by an extensive reef (*recife*), which, according to Koster, continues along the whole coast from Maranham, at a variable distance from the shore, and has numberless breaks, through which ships approach the land. This reef, which is said to be of coral, "is scarcely sixteen feet broad at top; it slopes off more rapidly than the Plymouth breakwater, to a great depth on the outside, and is perpendicular within to many fathoms." — GRAHAM, in *Modern Traveler*, XXX., 228. This natural breakwater forms the harbor; for though at high-water the waves beat over it, they strike the quays and buildings of the town with diminished force. Along the sandy neck of land between Olinda and Boa-Vista, however, which is not covered by the reef, the surf is very violent; but the harbor itself is quite safe for vessels that are well-found and well-moored. It consists of two parts—the Poco, capable of receiving vessels of 400 tons and upward, entered across a bar on which there are from seventeen to thirty feet of water, and the Mosqueiras, much better protected than the former, but on the bar of which there are but seven feet of water at ebb-tide. Vessels trading with Pernambuco should not, however, draw more than from ten to twelve feet of water.—BLUNT'S *American Coast Pilot*, 519. The harbor is defended by several strong military works, the principal being the stone forts of Do Buraco and Do Brum. The light-house, on a reef at the entrance to the harbor, has a revolving light.—*See* PROVINCE OF PERNAMBUCO; *also* BRAZIL.

Foreign vessels are not allowed to engage in the coasting trade, but they can load here for any foreign port. Vessels from the United States can discharge part of their cargo, and, if desired, they can proceed on with the remainder to Bahia, Rio de Janeiro, etc.

There are no insurance offices here, all business of that kind being done either in the United States or England. With funds in hand, a commission of 2½ per cent. is charged. Vessels are generally chartered both ways, arriving with flour, the charterer stipulating for a return cargo of sugar. Vessels coming out on their own account have been chartered back this season as low as 60 cents a bag of 160 lbs. Usually, however, the freight ranges from 80 cents to $1 per bag. There is no business done in exchange between this port and the United States, except the few whalers' drafts that are purchased at from two to twelve per cent. discount. The value of the milreis is governed by the state of exchange on England. The principal articles imported from the United States are flour and tea. The former pays a duty of 3 milreis ($1 50) per barrel, and the latter pays 600 reis (30 cents) per lb.; hams pay 60 reis (3 cents) per lb.; tobacco pays 180 reis (9 cents) per lb. Sugar and hides are the only articles of export worth mentioning. Sugar pays an export duty of eight per cent. The export duty on hides is ten per cent. on a valuation fixed weekly by a committee appointed for the purpose. The only articles on which this government levies a consumers' tax are, all spirituous and malt liquors, cigars, tobacco, soap, and snuff. Wines and liquors pay 1½ cents a canada (1¾ gallons); 56 cents, in addition to this, is levied on each pipe for what the decree terms "charitable purposes." Cigars pay 56 cents per 1000; tobacco, 1 cent per lb.; soap, 1½ cents per lb. This tax affects the United States only in tobacco and snuff.—*Consular Returns for the United States*, 1854.

Perry, a fermented liquor made from pears, in the same manner as cider from apples. The pears best fitted for producing this liquor are exceedingly harsh and tart; but it is itself pleasant and wholesome.—*See* CIDER; PEARS.

Peru, a republic of South America, between lat. 3° 25′ and 21° 48′ S., and long. 68° and 81° 20′ W. Area, 520,000 square miles. Peru is bounded north by Ecuador, east by Brazil, southeast and south by Bolivia, and west by the Pacific Ocean. Its coast reaches from the month of the Rio Tumbez to that of the Loa, 1240 miles; capital, Lima. All the mountains of Peru form part of the great chain (cordillera) of the Andes. From Porco, in Bolivia, it is separated into two chains—that of Ancumar, which runs from the east between the provinces of Carabaya and Azangaro, in the department of Puno, and that which runs to the west through Tacna, Moquegua, and Arequipa. Both reunite afterward near the city of Cusco, and again separate, the one running to the east of the provinces of Huanta and Tarma, and the other to the west of those of Castrovireyna, Huancavelica, and Huarochiri, reuniting themselves again in Pasco. From Pasco three chains detach themselves —the eastern between the Rio Guallaga and the Pachitea, the central one between the Guallaga and the Upper Marañon, and the western one between the latter and the coast of Trujillo and Paita. These several chains reunite in the province of Loja, in Ecuador. The direction of these chains of mountains determines the great valleys of the interior of Peru. The lakes most notable in Peru are those of Titicaca, between the departments of Puno and La Paz, the latter in Bolivia; of Urnos to the south of the city of Cuzco; of Pleyes or Junin; and of Lauricocha, in the department of Junin. Lake Titicaca has a periphery of ninety leagues, and that of Junin of ten leagues. The other two are

smaller. In that of Lauricocha the Rio Marañon has its birth; in that of Junin, the Rio Jauja, which runs into the Ucayali; and in that of Titicaca, the Desaguadero (anglicé, *outlet*), which empties into the Lake of Paria, in the Republic of Bolivia. The rivers of Peru flow, some to the Pacific Ocean, others into the Amazon, and others into Lake Titicaca. Those that empty into the Pacific are the Tumbez, Chira, Sechura, Jequitepeque, Saña, Viru, Santa, Patavilca, Huaura, Chillon, Rimac, Mala, Cañete, Pesco, Ocoña, Camana, Quilca, Tambo, and Loa; and those flowing to the Amazon are the Tungaragua or Marañon, which takes the name of Amazon at its confluence with the Ucayali, the Guallaga, the Ucayali (formed by the rivers Pachitea, Apurimac, and Beni), and the Rio Yavari. The mineral resources of Peru, like those of Mexico, are inexhaustible. The very name of the country is associated in the mind with ideas of gold and silver. Besides the precious metals, however, the country produces copper, tin, iron, coal, saltpetre, etc., in abundance—the latter, under the name of nitrate of soda, has become an important export. The agricultural staples of the country are sugar, rice, tobacco, etc., which grow in the warmer situations; the vine, wheat, etc., in the milder. Potatoes are cultivated in all parts. Maize is cultivated, and is the common diet of the people. Medicinal plants, drugs, and dye-stuffs form a large part of the exports, and some of the hard woods abound in the forests. The Cinchona, or Peruvian bark, is indigenous to the country: it grows at the elevation of 10,000 or 12,000 feet, and abounds most in the northern provinces. Among the wild animals of Peru are the puma, the uturunca (a species of tiger), the acumari (a black bear), and great varieties of deer, wild bears, armadillos, etc. The llama, alpaca, guanaco, vicuña, etc., are the most valuable animals. Four varieties of condor are indigenous. Of acclimated animals the sheep has succeeded best, and goats, hogs, etc., thrive well. In the mountains cattle and horses find a congenial climate, but on the coast speedily pine and die away. The wool of Peru is among the best in the markets. The political divisions of Peru consist of eleven departments, and two provinces called "littorales." The departments are subdivided into sixty-one provinces, the provinces into districts, and these into parishes. The government, civil and economical, of each department is in charge of a Prefect, dependent directly on the President of the Republic; that of the provinces is in charge of Sub-prefects, dependent on the Prefects; that of the districts is in charge of Governors, and that of parishes is in charge of Sub-governors. The departments and the population in 1852 were as follows:

Departments.	Population.	Capitals.
Amazonas	43,074	Chachapoyas.
Ancach	219,145	Huaraz.
Arequipa	119 336	Arequipa.
Ayacucho	132,921	Huamanga.
Cuzco	349,718	Cusco.
Huancavelica	70,117	Huancavelica.
Junin	222,949	Cerro de Pasco.
Libertad	204,553	Trujillo.
Lima	251,801	Lima.
Moquegua	61,432	Tacna.
Puno	285,661	Puno.
Provincia Littoral de Callao	8,453	
Provincia Littoral de Piura.	70,332	
Total population	2,106,492	

The most eastern parts of the departments of Amazonas, Junin, Ayacucho, and Cuzco have not been well explored, and are inhabited by diverse tribes of savage Indians, for whose civilization different missions have been established, and to whom belongs entirely all the territory to the east of the Ucayali, and where the Prefects of the departments above-named do not exercise their authority.

Peru is an integral republic. The Constitution, which was finally settled in 1839, recognizes legislative, judicial, and executive powers entirely separate and independent of each other. The legislative power is vested in a Senate and Assembly, chosen by the people through electoral colleges; the deputies are apportioned in the ratio of one to every 20,000 inhabitants. The judiciary is appointed by the President, and judges are not removable except for cause. The Constitution provides for sub-judiciaries, having separate qualifications, for departments, districts, towns, and parishes. The executive power is delegated to a President, whose term is six years. There is no Vice-president, but the President of the Executive Council supplies the place of President in case of the removal, inability, or death of that officer. The Council consists of the Ministers and members of the Senate. The established religion is the Roman Catholic. The Church is presided over by an Archbishop and several suffragans. It is immensely rich. The Inquisition has been entirely abolished throughout the Republic.

Peru was conquered in 1532 by the Spaniards, under Pizarro and Almagro, and remained a colony of Spain for nearly three hundred years. The independence of the country was proclaimed at Lima, 28th July, 1821. Since that period the following parties have exercised supreme power: General San Martin, to 21st September, 1822; thence a "Junta Gubernativa," composed of General Lamar and Señors Salazar-y-Baquijuno and Alvarado; thence General Don José de la Riva Aguero, as President, to July, 1823; thence José Bernardo Tagle; thence General Simon Bolivar, to July, 1835; thence a "Council of Government," to the end of 1826; thence General Bolivar, as President; thence General Lamar, as Constitutional President, to June, 1829; thence General Gamarra, to 1833; thence General Orbegoso; thence General Salaberry, as "Supreme Chief," to 1836; thence General Santa Cruz, to 20th January, 1839; thence General Gamarra, to November, 1841; thence Señor Menendez, to August, 1842; thence Vidal, Figuerola, and Vivanco, successively, to 1844; thence Menendez (restored), to 1st April, 1845; thence General Ramon Castilla, to 1st April, 1851; and thence General Rufino Echenique, the present President.

The following is a statement of the public debt of Peru, as given by Señor E. Escobar de Bedoya, attaché to the Legation of Peru at Paris, 26th October, 1853:

Loans on the fours-and-a-half in England	$13,000,000	£2,600,000
Loans on the threes per cents. in England	8,500,000	1,700,000
Interior debt	23,200,000	
Debt to Chili	2,000,000	
Debt to the Republics of Old Columbia	3,600,000	
Total	$50,300,000	

The deposits of Chincha alone are worth three hundred millions of dollars (piastres). The Chincha and Lobos Islands, off the coasts of Peru, are of immense value to the country, on account of their guano deposits. This substance is the most potent of fertilizers, and until lately the islands above-named were the only sources whence it was derived. According to a report made by Señor Villa in 1812, the deposits in these islands were estimated to be 46,632,280 tons. Assuming the consumption to be 300,000 tons a year, valued at $20 a ton, it would produce $6,000,000 annually, and require 160 years for its total consumption. This resource has been an efficient aid to the national treasury, and has made Peru the most apparently prosperous of all the South American republics. The exports in 1852 amounted to 220,500 tons—32,000 of which went to the United States, and the remainder to France and England.—*See article* GUANO.

According to a treaty between Peru and the United States signed July, 1857, it is agreed that the permission to the whale ships of the United States by the treaty of 1851, to barter or sell their supplies and goods to the value of two hundred dollars, *ad valorem*, without being obliged to pay port or tonnage dues or other imposts, should not be understood to comprehend every kind of merchandise without limitation, but those only that whale ships are usually provided with for their long

voyages. That in the said exemption from duties of every kind are included the following articles in addition to the produce of their fishery, viz., white unbleached domestics, white bleached domestics, wide cotton cloths, blue drills, twilled cottons, shirting stripes, ticking, cotton, prints, shirtings, sailors' clothing of all kinds, soap, slush, boots, shoes, and brogans, axes, hatchets, biscuit of every kind, flour, lard, butter, rum, beef, pork, spermaceti and composition candles, canvas, rope, tobacco.

The principal ports of Peru are Paita, San José, Huanchaco, Callao, Islay, Arica, and Iquique. These are ports of entry for foreign commerce. There are other ports open to the coasting trade, and for the exportation of the produce of the country. These are Ylo, Chala, Pisco, Huacho, Casma, Pacasmayo, and Tumbez, and the small harbors of Sechura, Samano, Santa, Supe, Huarmes, Echenique, Chancay, Ancon, Cerro, Azul, Chilca, Cancato, Nasca, Quilca, Cocotea, Morro de Sama, and Pisaque.

The commercial relations of the United States with Peru are regulated by the treaty already cited, bearing date July 26, 1851, and by such decrees and orders as are issued from time to time by the Supreme Government of that republic. The treaty guarantees entire liberty of commerce and navigation, and perfect reciprocity between the flags of the two countries in the ports of the other.

The trade between the two nations (Peruvian guano excepted) is not, however, very extensive, as appears from the official returns of the United States Treasury Department. Before entering into the details of the commerce between the United States and Peru, the following summary of the general foreign trade of that republic is given, with a view to show the relative rank held by the United States and other nations in that trade. The figures are derived from the official returns of the Peruvian government for the years 1851 from all nations, and in 1851 and 1853 from the United States. —*See Commercial Relations of United States.*

1852	9,916,242	10,173,216
1853	9,087,898	16,883,630
Total	$27,851,606	$40,142,562

Balance of foreign trade in favor of Peru, during these three years, $12,290,956; making an annual average in favor of Peru of $4,096,985. The number of vessels employed in the steam navigation of Peru is: six steamships belonging to the British mail line, which ply semi-monthly between Valparaiso and Panama. The aggregate tonnage of these six steamers is 3506 tons. There is also a seventh steamer of 500 tons on the same line. One Peruvian steamer, of 250 tons burden, coasts regularly between Callao and Valparaiso. The two latter are screw-propellers; the other six have paddle-wheels. The merchant marine of Peru in 1852 consisted of nine ships, with an aggregate of 3194 tons; ten barks, measuring in all 4156 tons; and eight brigs, of 1681 tons; making a total of twenty-seven vessels, with an aggregate of 9031 tons. The total number of Peruvian vessels employed in the coasting trade during the same year was 141, with an aggregate of 14,705 tons. The number of seamen engaged in this service is about 4000, of which 2150 are natives, and 285 citizens of the United States—1250 being employed in the foreign trade, and 2750 in the coasting trade. The tables on next page, transcribed from French official authorities (the dollars having been reduced to francs by multiplying by 5), exhibit in detail the general import and export trade of Peru in 1853.

Callao is the chief port in Peru for foreign commerce. The aggregate tonnage of Peruvian vessels, belonging to and employed in foreign trade at Callao, in 1852, was 67 vessels, measuring an aggregate of 15,031 tons; in the coasting trade the number of vessels was 181, with a tonnage of 17,705 tons; making a total of 248 vessels, and 32,736 tons. Besides the above, there were employed, during the same year, at the port of Pisco, six vessels of 1200 tons aggregate; and at the port of Huacho (both ports being in the consular district of Callao), eight vessels, with an aggregate of 400 tons; making a total in both ports of 1600 tons. The total number of Peruvian vessels which entered at Callao (in foreign trade) in 1852 was 150, with a tonnage of 19,478 tons; and the number cleared, 157 vessels, with a tonnage of 19,326 tons. The number and tonnage of United States vessels which entered Callao during the same year was: vessels, 69; tonnage, 27,360 tons; and the number and tonnage of those cleared was: vessels, 56; tonnage, 23,650 tons. The following comparative table shows the rank which the United States held, relatively with other foreign nations, in the navigation of this port in 1852, including British mail steamships:

Nationality.	Entered.		Cleared.	
	Vessels.	Tons.	Vessels.	Tons.
United States	69	27,360	56	23,600
English	210	108,600	260	151,000
French	42	16,000	30	10,200
Spanish	9	3,500	11	4,000
Italian	17	6,500	20	8,100
German	25	13,800	30	12,400
Chilian	40	4,400	40	4,400
Others	20	4,000	20	600

The following statement exhibits the number and tonnage of United States vessels which entered at Callao during the years specified:

Years.	Vessels.	Tons.
1852	69	27,360
1853	235	159,521
1854	246	168,558

The general features of commercial transactions at Callao, and at the ports of Peru generally, are set forth in a communication of late date from the consul of the

NATURE AND VALUE, IN FRANCS, OF GENERAL MERCHANDISE IMPORTED INTO AND EXPORTED FROM PERU IN 1853.

United States at that port, as follows: "The most valuable of the articles imported into this consulate are asserted merchandises from England, France, Italy, the United States, Chili, Spain, and Equador; viz., Cotton, linens, silks, wines, hardware, etc. From the United States, domestic cottons, furniture, lumber, provisons, etc. The export trade of Peru consists chiefly of guano, which is sent to England, the United States, France, and Spain, and in smaller quantities to Italy, India, and the West Indies. The export was forced during the revolution, and a diminution has taken place under the present government, owing to over-supplies in Europe and the United States, and a wish on the part of Peru to raise the price of this article abroad to its consumers. It is valued on board the ships at the Islands where laden at $5 per ton—that is, at the cost attending its shipment. The average rate of freights to the United States during the year past (1855) has been $22 per ton of 2240 lbs. This much of the product of guano goes into the hands of our ship-owners, who carry nearly all of it to the United States, and part of it to other places, from Callao and the Chincha Islands. No prohibitions exist, in fact, upon imports; but arms and munitions of war are difficult of introduction during revolutions. Powder is strictly prohibited. The general trade regulations are liberal. Goods lie in bond at the option of the merchant; paying only, after the first month, storage and labor, until entered for consumption, or else exported abroad, and then no charges further. There are at present no differential or discriminating duties on any foreign vessels or goods. A quarantine exists in the case of coolies from China, who usually arrive sick; and this district, during the last three years, has become subject to fatal epidemic fevers, etc. United States capital is employed in the ice trade, and in repairing ships; in the humbler trades, and in commerce, and upon the public works. The English at present enjoy the largest share of the import and export trade; but the activity and intelligence of all commercial nations are occupied in seeking a share, and the tendency is gradually toward a more equal participation.

Crude wools are largely exported; but the high duty on them in the United States throws nearly all that trade into Europe, mostly to England, where wool is free under the tariff. Of late they have been paying good profits. This remark applies also to the barks of Peru, and to copper. The bar silver exported all goes to England, because there is no direct steam communication with the United States. Some supplies of wheat, flour, and other agricultural products begin to be imported into this consular district from California, such as barley, potatoes, etc.; and about 2500 flasks of quicksilver, valued at nearly $100,000, have been imported during this last quarter. Whale ships, while cruising, call at times for refreshments, and to change their crews. The agricultural industry of the country has been obstructed by the liberation of the slaves in 1855, to replace whom Chinese coolies are being imported. Such laborers are also now being employed by the government at the Chincha guano islands, near Pisco. The army of Peru employs about 7000 Cholo half-breed Indian soldiers, the tendency of which polity is to hinder population. There is a perceptible increase in the number of Americans in this consulate—seamen, artisans, and tradesmen, who come to reside. Nitrate of soda is largely exported—at least a million and a half of quintals annually, valued at $2 per 100 lbs.; a considerable part of which goes to the United States. Dry and salted hides, and straw

hats, are exported in small quantities. The circulating currency of Peru, representing silver, and now the only money in common use, is below the nominal standard about three-eighths, or 37½ per cent. The rate of exchange fluctuates from five to fifteen per cent. on the dollar. The dollar of Peru, in invoices of export to the United States, is now usually valued at from 80 to 85 cents of United States currency. The Peruvian dollar, of pure silver, not in circulation, is worth about 87½ cents of United States currency. Gold coins of Peru are not now seen in common use. Patriot doubloons pass current at $17, and of late are worth 3 per cent. premium, and but few to be obtained."

Paita.—The chief staples of export from the port of Palta are straw (Panama) hats and Peruvian bark. The exports consist chiefly of cotton manufactures, of iron, and assorted sundries. The official navigation returns for this port, for a period later than 1852, are not at hand. There entered from all foreign nations in that year 185 vessels, with an aggregate of 61,624 tons; of which there were from the United States 42 vessels, measuring an aggregate of 10,256 tons. The direct trade between the United States and this port is limited, owing to the facilities afforded in the coasting trade between this point and Callao.

Arica.—The staple exports from the port of Arica are tin, copper ore, Peruvian bark, and alpaca wool. With the exception of the latter, all these exports are of Bolivian produce. Indeed, the port of Arica is merely a transit port for Bolivian produce and trade. Owing, however, to some misunderstanding between the governments of Peru and Bolivia, which resulted in the imposition by the former, in 1853, of 40 per cent. duty on the produce of the latter passing through this port, this transit trade is now conducted through the port of Cobija (Port La Mar), the only port open for foreign commerce in Bolivia. The imports from the United States are cotton domestics, blue drills, chairs, and shoes, on which last-named article a duty of 40 per cent. is levied.

Iquique.—This port possesses a harbor safe and commodious, and is well protected by the island of Iquique from the heavy swells which, in the winter season, set in from the southwest. With the exception of a few months during the late revolution in Peru, up to the month of July, 1855, when it was declared a *puerto mayor*, Iquique ranked as a *puerto menor*, with some extra privileges. The province of Iquique is the great centre of the nitrate of soda trade, and to this article alone it owes its present position. Out of a population of about 15,000 four-fifths are more or less interested in this trade. At the works, the nitrate of soda varies in value from 81¼ cents to $1 06¼ per quintal. The rate of carriage to the coast varies from 68¾ cents to 93¾ cents per quintal. The average rate paid for the article placed on the beach is $1 75 per quintal; and this price gives the makers a profit of 9¾ cents per quintal.

Nitrate of soda is always sold deliverable along side the ship's launch, outside the surf. The merchant has to bag and embark it, which costs him about 21¾ cents per quintal. Selling it, therefore, at $1 87½, would yield him a profit of 15¾ cents per quintal.

Nitrate of soda is used in the manufacture of sulphuric and nitric acids, and as a fertilizer. Between 1820 and 1830, attempts were made to export it to the United States and England, but the cargoes were unsalable. Soon afterward, however, its value became known, and at this time the quantity annually exported reaches nearly 1,500,000 quintals, valued at about $1 25 to $2 per 100 lbs. The following statement will show the total amount of nitrate of soda exported since 1830, when the trade began:

1830 to 1834, inclusive	.....	Quintals.	361,365

Before Iquique was constituted a puerto mayor, foreign vessels from any foreign port could call and anchor, provided their cargoes consisted of nothing but the following articles: Peas, beans, lentils, Indian corn, wheat, barley, nuts, raisins, almonds, cocoa-nuts, flour, bran, biscuit, macaroni, frangallo, chococa, dried potatoes, fat, butter, tallow, lard, jerked beef, cheese, live and dead stock, salted meats, and all kinds of vegetables and roots, candles and soap, fire-wood, timber for building, coals, bricks, iron, steel, nails, tools for mines, empty sacks, twine, machines for making nitrate or distilling water. It is now open to general commerce, and will necessarily become a port of much importance. Being the most windward of the Peruvian ports, vessels proceeding from the south, having other goods on board than those above specified, were obliged to go to Arica, the first puerto mayor, and, after dispatching at the custom-house there, beat back again to Iquique, at a cost of from five to fifteen days' sailing. The consequence of this restriction was, that but few vessels entered this port with cargoes direct from foreign countries. Another advantage to be derived from making Iquique a puerto mayor is, that it will open a transit trade into Bolivia, and thus render this port an entrepôt for an extensive trade with that republic. The distance to Potosi is much less—less, it is stated by three or four days' journey, than by the way of Cobija. The mules would only have to travel fifteen leagues without water, and the pass in the Cordillera is equally as favorable as by the latter route.

Tumbez.—No vessels except whale ships are allowed to enter at this port. The privileges to which American whalers are entitled by the twelfth article of the treaty of Peru with the United States, have already been stated. The market of Tumbez is supplied chiefly by American whale ships, which usually import small quantities of American manufactured goods, flour, etc. Other foreign whale ships must conform to the general regulations of commerce, which allow them to anchor, provided they have on board only the products of the fishery, provisions and supplies necessary for the use of the vessel and crew, and to sell oil and candles to any amount, in exchange for provisions, free of import duty. The following summary exhibits the number and tonnage of American whaling vessels which arrived at the port of Tumbez, from August, 1852, to June 30th, 1855:

Years.	Number of Vessels.	Tons.
1852.....	28	7,711
1853.....	57	17,579
1854.....	64	19,042
1855 (first six months).	32	9,740

—*United States Commercial Relations.*

No deposits of guano which will at all compare with those of Peru seem as yet to have been discovered, although most extensive explorations have been prosecuted; nor has science yet succeeded, though inventive skill has been tasked to the utmost, in manufacturing a substitute which would supersede the use or lower the price of the Peruvian fertilizer.—*See* GUANO.

* Nine months to June 30, and the fiscal year from this time begins July 1.

A treaty of friendship, commerce, and navigation exists between the United States and the Republic of Peru, the terms of which treaty are adhered to in good faith at the ports of Peru; and although questions sometimes arise in police cases regarding seamen belonging to American vessels, the authorities assist readily in arranging such questions as they occur. The present existing regulations are fixed and definite as regards commerce. Changes in parts of these regulations are made by decrees issued by the President and Congress, when that body is in session, and by the President and Council of State during the recess of Congress, as required by the public exigencies. At present (August, 1855) the government is undergoing the process of a revision of its fundamental laws, now being made by a convention of deputies elected from all sections of the country, and holding its sessions in the hall of Congress at the city of Lima. There are no privileges permitted to the commerce of other nations which are denied or not allowed to the United States. There are no restrictions imposed on the commerce of other nations and not on that of the United States. But a line of eight fine British steamers, carrying the mails and running between the ports of Panama and Talcahuano, under the provisions of a postal convention existing between Great Britain and Peru, are exempted from all tonnage duties and port charges whatsoever in the ports of Peru, in consideration for the transmission of the mails of Peru to and from the various ports of Peru at which they touch in making passages to and from Talcahuano and Panama. The whaling vessels of the United States, also, are allowed certain privileges in the port of Tumbez and all the open ports of Peru, in virtue of the treaty now existing. Some question has been made by Peru as to whether this privilege should allow whale ships to avail themselves of its provisions in one port only, while on a cruise, or at each or any port or ports, and every time they visit such port or other port or ports of Peru. The amount of the port charges made upon the vessels of the United States in the ports of Peru is as follows, namely: Tonnage duty, 25 cents per ton; anchorage fee, $8 on vessels to Callao only; anchorage fee on vessels to Callao and the Chincha Islands is $4 more, making $12; inspector's fee, $4 25; custom-house fee, $4 25. The various stamped papers cost from $5 to $12, according to the operations made by the vessel. There are no light-house dues nor any light-houses, and no hospital money is exacted. The tonnage duty is only payable in one port, and only once in six months. There are no pilots nor any pilot system in Peru—the naturo of the ports rendering pilots unnecessary. National vessels that measure less than 200 tons do not pay any tonnage duty, but pay the other port charges. National vessels over 200 tons register pay 25 cents per ton, being the same duty that the vessels of all nations are made subject to. The line of eight British mail steamers is exempted from all port charges whatsoever, under the conditions of the postal convention now existing between Great Britain and Peru. The transhipment of goods is permitted in the vessels of the United States, either to another port in Peru or to a foreign port. This privilege is allowed also to the vessels of all nations. By the *Reglamento de Commercio* for 1852, the latest yet published, it is allowed to vessels of all nations to take coastwise, from one open port (mayor) to another, any foreign goods in bond; that is, which have not paid duty; for example, from Arica or Isly to Callao. It is also allowed to take the productions of Peru, and any foreign merchandise free of duty, in the same manner, from any port to another port or ports in Peru. All vessels may go loaded with free goods, and the productions of Peru, not only from one open port to another, but from an open port to a minor port (menor), or from a minor port to an open port (mayor), or in any manner. Vessels of all nations are permitted to go to the port Iquique, to load with nitrate of soda and other articles, and also to proceed from Callao to the Chincha Islands to load with guano.

The moneys, weights, and measures, known and in common use in Peru, are those of Spain, having remained the same as when Peru was a colony of Spain.

The difference between the vara and the yard in the custom-house is eight per cent. additional, the vara being about 33 inches of the English yard of 36 inches. The gross and dozen are the same as in the United States. The gallon of oil, of wine, and of spirits, are each taken at 7½ pounds to the gallon. The fanega is an arbitrary ideal measure, and is regulated by weight; namely, one fanega of wheat is 135 pounds; one fanega of millet is 130 pounds; one fanega of beans is 182 pounds; one fanega of peas is 182 pounds; one fanega of corn is 156 pounds; one fanega of Lima beans is 156 pounds; one fanega of tallow is 180 pounds. But these measures do not come into use in foreign intercourse, or in any large transactions. There is no measure of bulk in use, such as a bushel or a gallon; articles measured in bushels or in gallons in the United States are sold by the pound or quintal of 100 pounds in Peru. The difference between the pound and quintal (of 100 pounds) of Peru and those quantities in the United States is two per cent., the pound of Spain and Peru being two per cent. heavier than the pound avoirdupois of the United States and England.

Insurance to the United States, one and a half to two per cent. Freight, $20 to $30 per ton of 2240 pounds, guano, delivered; and the same price on 40 cubic feet measurement of other articles. Commission, two and a half to five per cent. on the invoice. Cash in all cases on exports. Average rate of exchange, five to seven per cent. premium for a bill on the United States, and eight to ten per cent. on United States currency. The true par of exchange is: Specie, six to ten per cent. premium; by exchange, six to seven per cent. Bills, six to seven per cent. premium; by the currency, ten per cent. No duty is charged on merchandise exported. No internal or other taxes are levied on exports. Guano belongs to the government and people of Peru, and is sold by itself.

PRICES OF EXPORTS.

Articles.		Wholesale Price.
Guano from the Chincha Islands	Per ton of 2240 lbs.	
Nitrate of soda, a sort of saltpetre	Per 100 lbs.	$1 25

Balsam	"	1 50

Peruvian Bark. The trees yielding Peruvian bark, which grow at an elevation of 7000 to 8000 feet on the Andes, have for a long series of years been felled for the sake of their bark, and no pains were taken to replace them. Fears have been naturally entertained that ere long the supply of bark, and consequently of quinine, would fail. Efforts have consequently been made to transplant the tree into countries where it is supposed the climate would be suitable. Dr. Royle has taken measures for introducing Cinchona Calisaya, or the yellow-bark tree, into the higher regions of India; and of late years the Dutch government have employed Mr. Haskarl to transport plants of various species of cinchona from South America to Java and other parts of the Dutch East Indies. These attempts have been successful; and the reports in regard to the growth of the plant are such as to lead to the expectation that ere long the Peruvian bark trees will be scattered over extensive districts, and will thus be saved from destruction.—*Edin. New Phil. Journ.*, No. 9.

Pewter (Ger. *Zinn*, *Zinngeisserzinn*; Fr. *Etain*; It. *Stagno*; Sp. *Estano*, *Peltre*; Russ. *Olowo*), a factitious metal used in making plates, dishes, and other domestic utensils. It is a compound, the basis of which is tin. The best sort consists of tin alloyed with about one-twentieth or less of copper, or other metallic bodies, as the experience of the workmen has shown to be most conducive to the improvement of its hardness and color, such as lead, zinc, bismuth, and antimony. There are three sorts of pewter, distinguished by the names of plate, trifle, and ley pewter. The first was formerly much used for plates and dishes; of the second are made the pints, quarts, and other measures for beer; and of the ley-pewter, wine measures and large measures. A fine pewter is made, according to Aiken, by fusing together 100 parts of tin, 8 of antimony, 1 of bismuth, and 4 of copper. The use of these additions to tin is to harden it and preserve its color; and a good pewter, when clean and polished, has a silvery lustre, and does not readily tarnish. Common pewter, of which measures and pewter pots are made, is an alloy of lead and tin.

Philadelphia, the metropolis of Pennsylvania, and the second city in the United States of America in population and in manufactures, is in lat. 39° 56′ 39″ N., and long. 75° 10′ 54″ W., 130 miles from Washington, and 87 from New York. Population in 1800 was 70,287; in 1810, 96,287; in 1820, 119,325; in 1830, 167,325; in 1840, 258,037; in 1850, 408,762; and in 1854, 480,000. It is situated between the Delaware and Schuylkill rivers, five miles above their junction, and extends from the one to the other. The rivers bounding it lie about two miles apart in the narrowest place. The city is 100 miles distant from the ocean by the course of the Delaware. Its principal harbor is on the east, or Delaware River side, where ships come up, and its foreign commerce centres. Philadelphia has an extensive foreign, and a still greater domestic trade; by means of railroads and canals it possesses facilities for communication with a great extent of country. The city is built upon a plain rising gradually from the Delaware on the east, and the Schuylkill on the west, to the height of about 65 feet above the surface of the rivers at highest water. The portion most densely built upon has an outline of about ten miles, and extends along the Delaware River five miles. Philadelphia is laid out with great regularity, the streets, with but few exceptions, crossing each other at right angles. High Street, extending from river to river, and Broad Street, which extends south and north from Penn Square, are very wide and spacious thoroughfares; the other streets are, many of them, neat and cleanly kept. The public buildings are generally tasty and well built edifices, and the private residences have a neat and cheerful appearance. It was surveyed and laid out in 1682 by Thomas Holmes; the ground selected was claimed by three Swedes by the name of Swenson, who held a title to it obtained of the Dutch Governor of New York in 1664. This claim was purchased by Penn.—*Harper's and Lippincott's Gazetteers.*

Manufactures.—This branch of the industry of Philadelphia is very important both as regards value and extent. The vicinity abounds with water-power of great magnitude, and coal is obtained at an easy and cheap rate, so that steam can be applied as a motive power to a great advantage over other places, and which has been made extensively available. Machinery, locomotives, hardware, sugar-refining, cordage, and a variety of wares are produced here.—*Census Report*, 1850.

CAPITAL INVESTED, THE NUMBER OF HANDS EMPLOYED, AND THE VALUE OF THE ANNUAL PRODUCT OF THIS BRANCH OF INDUSTRY, IN THE CITY AND COUNTY OF PHILADELPHIA DURING THE YEAR ENDING JUNE 30, 1850.

Districts.	Capital invested.	Hands empl'd.		Annual Products.

Coal Trade, etc.—The coal trade during the year 1853 amounted in value to over $10,000,000, and the quantity brought to market about 6,000,000 tons. The

commerce of Philadelphia is rapidly on the increase, amounting in value the same year to $14,500,000, and employing a tonnage of 252,451 tons. In 1854 there was a line of first-class steamships and four lines of sailing-vessels plying between this port and Liverpool; two steamships to Charleston, South Carolina; one to Richmond, Virginia, *via* Norfolk and Petersburg; one to Boston; one to Hartford; two to New York; and one to Baltimore. These vessels were substantial and well built, and most of them constructed in this city. The total number of steamships, ships, barks, brigs, schooners, barges, etc., entering the port during the year 1856, was 27,044.—*See* COAL; COINAGE.

The following railroads centre here: The Camden and Amboy; Philadelphia and Trenton, connecting with the New Jersey; the Camden and Atlantic; Philadelphia and Germantown; Philadelphia, Reading, and Pottsville; the Great Central Railroad of Pennsylvania, with its extensive connections; Philadelphia and Westchester; Philadelphia, Wilmington, and Baltimore, etc. The Schuylkill Navigation Canal, 108 miles long, extends to Port Carbon; and the Chesapeake and Delaware Canal, 14 miles long, extending from the Delaware River at Delaware city to Back Creek, Maryland. These great arteries of traffic contribute much to the trade of Philadelphia.

The city, as consolidated by the act of January, 1854, embraces a territory 23½ miles long, and 5½ average breadth, coextensive with the county. It is divided into 24 wards, and is governed by a mayor, elected for two years, a select council of 24 members for the same period, and a common council of 72 members, elected annually.

Philadelphia was first surveyed and regulated in 1682. It had previously been in possession of the Swedes, some of whom came into the country bordering on Delaware Bay as early as 1627. It was named after a city in Asia Minor, and the plan is said to have been suggested by that of ancient Babylon, and according to the original design of William Penn, its original founder and proprietor, was designed to have equaled that ancient capital in extent; but the idea was soon abandoned, and the charter of 1701 restricted it to the boundaries of the late city proper. Penn's country residence was at Pennsbury Manor, above Bristol, in which was a large Hall of Audience, where he held treaties with the Indians; and the oak armchair in which he sat is now in the Pennsylvania Hospital. The first Congress assembled in Philadelphia September 5th, 1774, and adopted a declaration of rights; on July 4th, 1776, the Declaration of Independence; in the autumn of 1776 retired to Baltimore; September 26th, 1777, the city fell into the hands of the British, who occupied it until the 18th of June following. May 17th, 1787, a convention met here, and in September 17th, following, agreed on a Constitution for the United States, when it became the seat of Government of the United States until 1800.

Harbor, Light-houses, Pilotage, etc.—Vessels of the largest burden ascend the river as far as Newcastle, but those drawing above 18 or 20 feet water can not reach Philadelphia on account of a bar a little below the city. The entrance to the magnificent bay formed by the embouchure of the Delaware, has Cape May on its north, and Cape Henlopen on its south side. The former, in lat. 38° 57′ N., long. 75° 47′ 45″ W., is a sandy headland, rising about 12 feet above the level of the sea. It has recently been surmounted by a light-house 60 feet in height. The light revolves once a minute; an eclipse of 50 seconds being succeeded by a brilliant flash of 10 seconds. It is seen in clear weather from 20 to 25 miles off. Cape Henlopen, marking the southern boundary of the bay, is in lat. 38° 47′ N., long. 75° 4′ 45″ W. A little south from it is a hill, elevated about 60 feet feet above the level of the sea; and on it is erected a light-house 72 feet in height, furnished with a powerful *fixed* light visible in clear weather ten leagues off. To the north of this principal light, and close to the extremity of the Cape, a second light-house has been constructed, 36 feet above the level of the sea, which is also furnished with a *fixed* light, which may be seen about six leagues off. The channel for large ships is between Cape Henlopen and the banks called the Overfalls. The navigation is, however, a little difficult, and it is compulsory on ships to take pilots. The latter frequently board them at sea; but, if not, as soon as a ship comes between the Capes, she must hoist the signal for a pilot, and heave to as soon as one offers to come on board.

PHILADELPHIA TO THE OCEAN.—DISTANCES, IN STATUTE MILES, FROM PHILADELPHIA (MARKET STREET WHARF) TO THE CAPES, BY THE USUAL STEAMBOAT CHANNEL, AS LAID DOWN ON THE CHART OF THE DELAWARE BY THE UNITED STATES COAST SURVEY.

From Philadelphia (Market Street Wharf) to	Miles
Fort Mifflin landing (broad off in channel)	8 3-8
Chester landing " "	16 5-8
Marcus Hook landing " "	20 1-4
Quarryville " " "	24 3-4
Dupont's " " "	26 3-8
Wilmington, by the Christiana, to bridge	31 3-4
New Castle, railroad wharf (broad off in channel)	34
Delaware City landing " "	39 5-8

Exports of Breadstuffs.—The annexed statement shows the quantity and value of breadstuffs exported from Philadelphia to foreign ports during 1855 and 1856:

	1855.		1856.	
	Quantity.	Value.	Quantity.	Value.
Flour .... Barrels.	218,197	$1,092,618	343,335	$2,400,113
Corn meal "	45,168	455,204	21,249	290,400
Rye meal. "	12,757	80,238	16,298	68,612
Wheat ... Bushels.	226,071	451,921	662,888	1,049,717
Corn ..... "	686,252	683,782	1,093,521	711,090
Rye, Oats, etc.	....	57,897	....	232,435
Total.....	....	$3,677,507	....	$4,753,336

These figures show a marked difference in the prices of breadstuffs in the years specified, as follows:

	Average Price 1855.	Average Price 1856.
Flour.....	$8 90½ per barrel.	$6 90 per barrel.
Corn Meal ...	4 57½ "	3 18½ "
Rye Meal	6 76 "	4 21 "
Wheat.....	1 99½ per bushel.	1 53½ per bushel.
Corn	99½ "	64½ "

It will be observed also that, had the articles enumerated brought the prices in 1856 that were paid for them in 1855, the value of breadstuffs exported in 1856 would have aggregated $6,123,216 instead of $4,753,336, the real cost.

Receipts of Cattle in Philadelphia.—The following tabular statement presents the number of cattle received here during each of the last twelve years, with the exception of the large number brought in by butchers, of which no account can be obtained:

Years.	Beeves.	Cows.	Swine.	Sheep.	Total.
1845	51,298	18 8 5	20,455	56,948	153,500
1846	47,500	14,480	18,670	55,810	136,460
1847	50,270	16,700	22,450	57,800	147,220
1848	67,211	14,108	47,690	76,820	205,829
1849	68,120	14,320	46,700	77,110	206,250
1850	68,750	15,120	46,900	82,500	213,270
1851	69,100	15,400	46,700	83,000	215,200
1852	71,200	14,420	49,200	81,200	216,020
1853	71,900	15,100	53,300	72,300	212,600
1854	73,400	15,350	78,000	61,000	227,750
1855	55,200	11,530	65,300	132,500	264,530
1856	61,078	12,900	103,350	240,700	418,928

The following table shews the measurement of grain, seeds, salt, and coal, in Philadelphia, annually, for the last sixteen years. This statement, of course, does not include all the receipts of grain, seeds, etc., at this port.

Years.	Wheat.	Corn.	Rye.	Barley.	Oats.	Seeds.	Beans.	Bit. Coal.	Salt.

Boats	9,800	8,523	8,420
Total	24,483	25,109	27,555

COMPARATIVE STATEMENT OF THE NUMBER OF VESSELS, FOREIGN AND COASTWISE, WHICH HAVE ARRIVED AT PHILADELPHIA DURING FIVE YEARS.

Total in 1852	25,169
Total in 1853	30,126
Total in 1854	29,001
Total in 1855	30,223
Total in 1856	27,044

The following are abstracts of the vessels entered and cleared at the port of Philadelphia, from and to foreign ports, during the year ending June 30th, 1856; from which it appears that the total number of vessels entered under the American flag during the year was 452, and the tonnage 198,253 tons, being an increase of 32 vessels and 8432 tons over the year 1855. The total number of vessels entered under foreign flags was 125, and the tonnage 37,696 tons, an increase of 10 vessels and 17,497 tons over 1855; making a total increase over the preceding year of 42 vessels and 25,929 tons. The total number of vessels cleared under the American flag was 304, and the tonnage 110,581 tons, a decrease of 22 vessels and 7849 tonnage under 1855; and the total number of vessels cleared under foreign flags was 127, and the tonnage 38,409 tons, an increase of nine vessels and 18,362 tons, making a total decrease from that of the preceding year of 13 vessels, and an increase of 513 tons. *See* PENNSYLVANIA.

Philippine Islands, a large and important group in the Asiatic Archipelago, forming its northern division, and next to Cuba the most valuable colonial possession of Spain, chiefly between lat. 5° 32′ and 19° 38′ N., and long. 117° and 127° E., having north and east the Pacific Ocean, west the China Sea, and south the seas of Sooloo and Celebes. There are at least 1200 islands, great and small. Principal islands, Luzon, Mindano, and Palawan, with Mindoro, Panay, Marindique, Negros, Zebu, Bohol, Leyte, Samar, Masbate, and many of less size. Total area estimated at 120,000 square miles. The Spanish dominion is stated to extend over only 52,148 sq. miles. Population, in 1850, 3,815,878, consisting of Europeans, native whites, the Papuan negro race, and independent tribes, Malay Indians, half castes, and Chinese. The islands are of volcanic formation, and contain a chain of active volcanoes. Earthquakes also are of frequent occurrence. The group is within the range of the monsoons, and violent hurricanes are common. From May to September the western coasts are deluged with rain, while the October monsoon brings rain to the eastern coasts, at other seasons dry. The high temperature and abundance of moisture produce a luxuriant vegetation; so that they are capable of yielding all kinds of colonial, and probably European produce. Rice, millet, maize, sugar, indigo, hemp, tobacco, coffee, and cotton, are raised; and sago, cocoa-nuts, bananas, cinamon, betel, numerous fine fruits, and timber for ship-building are among the products. Buffaloes and most of the domestic animals common in Europe are reared. There are no predaceous quadrupeds; the cayman is found in the rivers. Pearls, pearl-oyster shell, the sea-slug, edible birds' nests, and sapan-wood, are important articles of export hence to China. Domestic weaving is pretty generally carried on by the females, and straw hats, cigar cases, and earthen-wares, are made; but the chief manufacture is that of "Government Manilla" cigars, which occupies 2000 hands at a royal factory in Manilla. The wretched colonial policy of Old Spain excluded all for-

eign ships and Chinese settlers from these islands, and the trade with the Spanish dominion in America was also confined to that conducted annually by a single ship. But such restrictions have vanished since the revolution, and the colony is now making commensurate progress toward prosperity. In 1842, 149 ships, aggregate burden 46,869 tons, entered, and 162 do., burden 50,226, cleared, at the different ports. Imports amounted in value to £900,080, one-third from England, and more than another third from China, the United States, and British India. Exports amounted in value to £974,160, chiefly sent to England, Spain, the United States, China, and Australia. Manilla (which see) is the principal seat of the trade, and also the seat of the government, it being the residence of the captain general. In each of the larger islands is a lieutenant governor; and each of the 80 provinces, governed by an alcalde, is divided into pueblos, or communes. The Roman Catholic religion has been extensively diffused among the Malay population. Public revenue is derived chiefly from duties on exports and imports, the tobacco monopoly, and a capitation tax, which in 1837 was paid by 1,305,142 adults, of whom 901,924 belonged to the island Luzon. Armed force amounts to about 7000 men, one-tenth Spaniards, and the rest Malays. These islands were discovered by Magalhaens in 1521, and settled by the Spaniards in the reign of Philip II., after whom they were named.

The commercial intercourse generally is under the laws and regulations of the mother country, but, in fact, is in some degree dependent upon the local authority, the power being with the governor to order the departure from the colony of any person who may become obnoxious to himself or his government. The regulations are fixed for an indefinite time; amendments are constantly proposed, and, for several years past, a total revision of the tariff of duties on foreign produce has been, from time to time, discussed. Any such changes, though they may be proposed and discussed in Manilla, can only be made law by the home government. In fact, the reins are held very tightly in Madrid, and the governor general is constantly made to feel his dependence upon the minister in power. Citizens of the United States enjoy the privileges of all other foreigners. There is no distinction made in the privileges or restrictions permitted or imposed on the commerce of foreign nations. The port charges consist of tonnage dues, river-cleaning dues, and light dues. The tonnage dues are 25 cents per ton register, if the vessel discharges or takes in cargo; and one-half, or 12½ cents per ton, if she departs without having broke bulk or received cargo. A vessel may land specie without being subjected to the full dues. The river dues, for the support of a mud-boat, are: on a vessel discharging and loading any cargo, 6¼ cents per ton; entering in ballast and sailing with cargo, or *vice versa*, 3¼ cents per ton; entering with cargo and sailing with same, 3¼ cents per ton; entering and sailing in ballast, nothing. The light dues are, on all foreign vessels, 6¼ cents per ton register. Spanish vessels pay one half these rates. The transhipment of goods is strictly prohibited. In order to effect a transhipment, the goods must be entered in deposit, actually brought on shore to the custom-house, and then shipped under fresh documents from deposit. There is but one port, this of Manilla, open to foreign shipping, and foreigners are excluded from all internal and coasting trade.

The moneys, weights, and measures in common use in Manilla are authorized by the laws of Spain, but can not be said to correspond with those of the mother country, inasmuch as in Spain the weight and measures are not the same throughout the kingdom. The moneys current here are specie only. Of gold, the doubloon of Spain, Mexico, and the republics of South America, of full weight, is current at $16. The smaller coins—halves, quarters, and eighths—at their proportionate value. Of silver, the dollar of Spain, Mexico, and the other South American republics, of full weight, is current at $1 United States currency. The relative smaller coins pass at their relative value. Copper coin is of three sizes; 1 cuarto, 2 cuartos, and 4 cuartos; 160 cuartos are equal to a dollar. Accounts are kept by Spanish merchants in dollars, real., and cuartos; 20 cuartos equal 1 real; 8 reals equal 1 dollar. Foreigners generally keep their accounts in dollars and cents. The value of these coins is about the same in the United States as here; but not being fixed by the United States laws, there is a fluctuation which can not be reduced to regular limits.

The weights in common use are piculs, quintals, arrobas, and pounds. The pound is about 1⅓ per cent. heavier than that of the United States. 25 pounds equal 1 arroba, or, at the United States standard, about 25½ pounds; 4 arrobas=1 quintal=101⅓ lbs.; 5½ arrobas=1 picul=140 lbs. The measures are long measure—inches, feet, yards, fathoms, miles, and leagues. 12 inches make 1 foot; 3 feet make one yard; 2 yards make 1 fathom; 1111 fathoms and 6 inches make 1 mile; 3 miles make one league. The yard (or vara) in use here is about 33 inches of the United States. Grain is usually sold in the country by the cavan. 4 apastanes equal 1 chupo; 8 chupos equal 1 ganto; 25 gantos equal 1 cavan. These differ, however, in the different provinces. In Manilla, a cavan of rice weighs 127 lbs.; of coffee, about 52 lbs.; of wheat, about 150 lbs. A tinaja of oil contains 16 gantos; of wine, 17 gantos.

The rate of insurance to the United States from Manilla is charged 3 to 3½ per cent.; but little is done, however, there being but one local insurance office with a trifling capital, the policies issued by which contain so many exceptions as to make them of very little value. The shipments of produce to the United States are covered by insurance made in the United States or in England. Freights vary constantly, being governed by the supply of tonnage and quantity of produce waiting shipment. At present, $20 per ton of 40 cubic feet of hemp and other measurement goods, and $12 or $13 per ton of 2240 pounds of sugar, are current. These are considered full rates. Commission is charged 2½ per cent. on all purchases for the United States. When a broker is employed he is paid a brokerage commission of 6¼ cents per picul on hemp, 6¼ per picul on sugar, 3¼ cents per picul on rice, and on other articles as may be agreed upon. All articles of produce are bought for cash, and paid for on delivery. Oftentimes payment is made in part before delivery, and in the hemp trade the advances made are very large. The rate of exchange between this and the United States is not quoted, there being no transactions in the regular course of trade. All exchange transactions per American account (and the greater portion of the exports to the United States is paid for in bills) are made through England, bills being drawn here on London bankers, by virtue of credits granted by the bankers themselves in London, or by their agents in the United States. The average rate of exchange during the past year has been, for bills on London, drawn at six months' sight, 5*s.* 0¾*d.* per dollar. The par of exchange is about 4*s.* 2*d.*, the same as in the United States; the currency in silver being about equivalent that of one country with the other. The dollar current here, being of the Mexican and South American currency, is worth one hundred cents in the United States.

Duties on exports are, on hemp, 2 per cent.; on tortoise shell, mother-of-pearl shell, and ratans, 1 per cent. (these three articles last named are, in fact, not productions of this island, but brought from the Soolee Islands, and pay 1 per cent. import duty); all other articles, 3 per cent. On all imports direct from the United States, 14 per cent. There are no internal taxes of any kind on produce. The rates of wages in agricultural pursuits are very low, generally paid in produce sufficing for the subsistence of the laborer, and difficult

to be reduced to a money standard. Artisans obtain 50 cents per day, and if expert workmen as high as $1, or even $1 50 per day. Laborers in and about Manilla, 25 cents to 37½ cents per day. On board ships in the bay they are paid 62½ cents per day. At these rates labor is much dearer than in the Atlantic cities of the United States—the quantity and quality of the work done by a Manilla workman comparing very unfavorably with that of a man in New York.—*See* MANILLA, SPAIN. For further information refer to *Quarterly Review*, vii. 235, xvii. 530, xxxv. 328.

The chief exports from Manilla (the seat of government, and the chief port of the islands) are hemp, sugar, sapan-wood, cigars, cordage, indigo, coffee, rice, hides, mother-of-pearl shell, almaciga, grass-cloth, and tortoise-shell. The principal imports are cotton fabrics, silks, woolens, haberdashery, drugs, clocks, jewelry, etc.

The leading exports to the United States in 1844 were:

Sugar	francs	1,000,000	= $205,200
Coffee	"	149,000	= 28,310
Hemp	"	1,444,000	= 274,360

The average price of hemp at Manilla is from $7 to $7 06½ per picul, though in 1854–'55 it ascended as high as $10, owing to the Eastern war. The average price of sugar is $3 37½.

The preceding table shows that the quantity of hemp exported from Manilla to the United States in 1853 amounted to 204,584 piculs=27,277,866 pounds; and the quantity of sugar to 194,195 piculs=25,892,667 pounds. The following condensed summary exhibits the total export trade from Manilla to the United States during the same year: Hemp, 204,584 piculs; sugar, 194,195 piculs; indigo, 9050 quintals; sapan-wood, 8602 piculs; coffee, 1724 piculs; mother-of-pearl shell, 712 piculs; hide cuttings, 3291 piculs; ratans, 763 piculs; hides, 4,886 piculs, grass-cloth, 19,598 piculs; gum almaciga, 2556 piculs; tortoise-shell, 214 catties; cigars, 148 thousand. The merchandise above specified was floated in 41 vessels; of which 21 cleared for New York, 17 for Boston, 2 for Salem, and 1 for Philadelphia. The preceding summary exhibits the general character of the imports into the United States from the Philippine Islands. In the official reports published at Manilla the trade with San Francisco is given separately from that with the United States. During the year under review (1853), the exports to California consisted of: Sugar, 3976 piculs; coffee, 7546 piculs; rice, 16,876 piculs; cordage, 2285 piculs; cigars, 812 thousand; paddy, 2949 cavanas; panocha, 1818 baskets; Indian corn, 8922 lbs.; garlic, 46 piculs; lime, 78 cavanas; hats, 1200. The total exports from Manilla to all countries in 1853 were: Sugar, 566,371 piculs; hemp, 222,689 piculs; sapan-wood, 81,963 piculs; rice, 303,902 piculs; cordage, 12,119 piculs; coffee, 18,080 piculs; cigars, 79,311 thousand; indigo, 9123 quintals; mother-of-pearl, 2040 piculs; hides, 5874 piculs; hide cuttings, 3697 piculs. In cotton goods (the principal import of the Philippine Islands) England and the United States are the chief competitors.

Formerly, if the master of a vessel touching at these islands desired to ship native sailors, he was obliged to give his bond for their return to Manilla This, it is obvious, was but a mere matter of form, and hence but few of the sailors thus taken away ever returned. After the discovery of gold in California, it was found extremely difficult to procure sailors at any of the Malayian islands; and this difficulty was increased by a new regulation at the Philippines, which requires the consignee to sign the captain's bond for the return of such sailors as should be shipped at Manilla This the consignees are, in most cases, unwilling to do. Hence the trade between the United States and the Philippines remains so long stationary. For a number of years the United States has enjoyed about one fifth of the entire trade of the islands. Were this difficulty in regard to the employment of native sailors removed, this one fifth of the trade would in a short time ascend to one half.

In ship-building at Manilla, the timber used is all the growth of the country. The timbers and knees are of "molare;" planking above water is of "mangachapuy," and below of "banaba" in the northern provinces, and "batitinan" in the south; deck beams, molare, or "dougon;" keel of dougon, and waterways of the same. All these woods are very excellent, and, if well seasoned before using, are very durable. The molare is a hard, close-grained, strong wood, but is very heavy; dougon is next in value, and the mangachapuy ranks third. There are many other kinds of wood which are used, according to the caprice of builders. The cost where grown is trifling, but if brought to Manilla the addition of freight makes it expensive. The preservation or seasoning of ship-timber is not attended to here; and there are no depositories of ship-timber, properly speaking, though it may always be had in sufficient quantities for repairs to vessels frequenting the islands.

Port-charges.—Vessels arriving in ballast, and not breaking bulk, pay 12½ cents per ton (register tonnage). If cargo is landed or stripped, 25 cents per ton. Mud-machine, 6¼ cents per ton; light-house dues, 6¼ cents per ton. Spanish vessels pay only one half of the above rates.—*United States Commercial Relations.*

COMMERCE OF THE UNITED STATES WITH MANILLA AND PHILIPPINE ISLANDS, FROM OCTOBER 1, 1820, TO JULY 1, 1856.

* Nine months to June 30, and fiscal year begins July 1, 1843.

Phosphorus, a substance of a light amber color, and semi-transparent; but, when carefully prepared, nearly colorless and transparent. When kept some time, it becomes opaque externally, and has then a great resemblance to white wax. It may be cut with a knife, or twisted to pieces with the fingers. It is insoluble in water; its specific gravity is 1·77. When exposed to the atmosphere, it emits a white smoke, and is luminous in the dark. When heated to 148° it takes fire, and burns with a very bright flame. When phosphorus is inflamed in oxygen, the light and heat are incomparably more intense—the former dazzling the eye, and the latter cracking the glass vessel.—THOMSON'S *Chemistry.*

Piano-forte. Invented by J. C Schroeder, of Dresden, in 1717. He presented a model of his invention to the court of Saxony; and some time after, G. Silverman, a musical-instrument maker, bega.. to manufacture piano-fortes with considerable success The invention has also been ascribed to an instrument-maker of Florence. The square piano-forte was first made by Freiderica, an organ-builder of Saxony, about 1758. Piano-fortes were made in London by M. Zumpio, a German, 1766, and have been since greatly improved by others here. They are now extensively manufactured in Boston, New York, Philadelphia, Baltimore, Albany, Buffalo, Cincinnati, Chicago, and St. Louis, and other cities of the United States.—For "Origin of the Piano-forte" see *Westminster Review*, xxxii. 306.

Piastres, or **Dollars,** Spanish and American silver coins in very extensive circulation. They are used in Spain, Italy, Turkey, South America, the East Indies, etc., varying in value in every country.—*See* COINS.

Pickles are various kinds of vegetables and fruits preserved in vinegar The substances are first well cleaned with water, then steeped for some time in brine, and afterward transferred to bottles, which are filled up with good vinegar. Certain fruits, like walnu. , require to be pickled with scalding-hot vinegar; others, as red-cabbage, with cold vinegar; but onions, to preserve their whiteness, with distilled vinegar. Wood vinegar is never used by the principal pickle-manufacturers, but the best malt or white-wine vinegar, No. 22 or 24. Kitchener says that, by parboiling the pickles in brine, they will be ready in half the time of what they require when done cold. Cabbage, however, cauliflowers, and such articles, would thereby become flabby, and lose that crispness which many people relish. When removed from the brine, they should be cooled, drained, and even dried, before being put into the vinegar. To assist the preservation of pickles, a portion of salt is also added, and likewise, to give flavor, various spices, such as long pepper, black pepper, white pepper, allspice, ginger, cloves, mace, garlic, mustard, horseradish, shallots, capsicum. When the spices are bruised they are most efficacious, but they are apt to render the pickle turbid and discolored. The flavoring ingredients of Indian pickle are Curry powder mixed with a large proportion of mustard and garlic Green peaches are said to make the best imitation of the Indian mango.

Pilchards, fishes closely resembling the common herring, but smaller, and at the same time thicker and rounder. They are rarely found on the British shores, except on the coasts of Cornwall and Devon, particularly the former, where they are taken in great numbers from the middle of July to the end of November, or even the middle of December. It is a saying of the Cornish fishermen, that the pilchard is the least fish in size, most in number, and greatest for gain, taken from the sea.

Pilchard Fishery.—This is carried on along the British coasts of Cornwall and Devon, from the Bolt Head in the latter, round by the Land's End to Padstow and

Bossiney in the former. Its principal seats are St. Ives, Mount's Bay, and Mevagissey. The fish usually make their appearance in vast shoals in the early part of July, and disappear about the middle of October; but they sometimes reappear in large quantities in November and December. They are taken either by *seines* or by drift-nets, but principally, perhaps, by the former. A seine is a net, varying from 200 to 300 fathoms in length, and from 10 to 14½ feet in depth, having cork buoys on one edge and lead weights on the other. Three boats are attached to each seine, viz., a boat (*seine-boat*) of about 15 tons burden, for carrying the seine; another (*follower*) of about the same size, to assist in mooring it; and a smaller boat (*lurker*) for general purposes. The number of hands employed in these three boats varies from about 13 to 18, but may be taken at an average at about 16. When the shoals of fish come so near the shore that the water is about the depth of the seine, it is employed to encircle them; the fishermen being directed to the proper place for casting or shooting the nets by persons (*huers*) stationed for that purpose on the cliffs and in the boats. The practice is to row the boat with the seine on board gently round the shoal; and the seine being, at the same time, thrown gradually into the water, assumes, by means of its buoys and weights, a vertical position, its loaded edge being at the bottom, and the other floating on the surface. Its two ends are then fastened together, and, being brought into a convenient situation, it is moored by small anchors or grapnels; sometimes, however, one or two smaller seines are employed to assist in securing the fish. At low water the inclosed fish are taken out by a *tuck-net*, and carried to the shore. A single seine has been known to inclose at once as many as 4200 hogsheads (1200 tons) of fish! But this was the greatest quantity ever taken, and it is but seldom that as many as 1200 hogsheads are caught at a time. The "take," in fact, depends on so many accidental circumstances, that while one seine may catch and cure in a season from 1000 to 2000 hogsheads, others in the neighborhood may not get a single fish. In some places the tides are so strong as to break the seines and set the fish at liberty. When the quantity inclosed is large, it requires several days to take them out, as they must not be removed in greater numbers than those who salt them can conveniently manage. Drift-nets are usually about half a mile in length, by about 4½ fathoms in depth; they are shot in the open sea, and entangle the fish in their meshes in the same way as the herring-nets. The fish thus taken are said to be superior to those taken by the seine, though it be doubtful, from their being strangled in the nets, whether they are so good for curing. As soon as the fish are brought on shore, they are carried to cellars or warehouses, where they are piled in large heaps, having a sufficient quantity of salt interspersed between the layers. Having remained in this state for about 35 days, they are, after being carefully washed and cleaned, packed in hogsheads, each containing, at an average, about 2600 fish; they are then subjected to a pressure sufficient to extract the oil, of which each hogshead yields, provided the fish be caught in summer, about three gallons; but those that are taken late in the season do not yield above half this quantity. This oil usually sells for from 12 to 15 per cent. under the price of brown seal oil. The broken and refuse fish and salt are sold to the farmers, and are used as manure with excellent effect. The skimmings which float on the water in which the pilchards are washed are called *dregs*, and are chiefly sold as grease for machinery. The fresh fish in a hogshead of pilchards weigh about 6 cwt., and the salt about 3½ cwt.; but the weight of the hogshead when cured and pressed is reduced to about 4½ cwt.; including the weight of the cask, from 20 to 24 lbs. Four-fifths of the persons employed on shore in the salting, curing, packing, etc., of the fish are women.—Dr. Paris's *Guide to Mount's Bay*.

Pilots and Pilotage. The name of pilot or steersman is applied either to a particular officer, serving on board a ship during the course of a voyage, and having charge of the helm and the ship's route; or to a person taken on board at any particular place, for the purpose of conducting a ship through a river, road, or channel, or from or into a port. Masters and mates of merchant vessels, after having passed an examination before legally constituted authorities, and possessing a certificate to that effect, may pilot their own vessels within the prescribed limits for which they have passed, without being liable to any penalty. In all other cases, when a master is by law subject to a penalty for not taking a pilot, he is bound to do so when he has the opportunity; and after the pilot is taken on board, the master has no longer any command of the ship, nor is he responsible for the management of her while she continues in the district for which the pilot is authorized to act. When beyond that district, the master again resumes the government of the vessel, the pilot being then no longer liable, although for his own convenience he may still remain on board. In such case he is only to be considered as a passenger, and is not entitled to any remuneration for whatever service he may choose to perform on the voyage, beyond that for which he was originally engaged; but should he remain on board at the request of the master, he is entitled, besides his pilotage, to a further remuneration per day or per month, according to the rules of the respective ports, from the day when he has passed the limits of his license to the day of his return to the port from which he was taken on board. If a master of a vessel in any district within which pilots are appointed to act (usually denominated "Pilots' Water") should, except under the circumstances before stated, refuse the service of a pilot offering to come on board, he immediately renders himself liable to his owners, freighters, or insurers for any damage that may occur to the vessel or cargo, arising from the want of such service. When the law does not compel a master to take a pilot on board, and he nevertheless, of his own discretion, chooses to do so, the pilot is considered to be the servant of the owners, who under such circumstances would be responsible to strangers for the management of the ship during the time he continued in charge. If the master at a foreign port attempt to obtain a pilot and fail, and then, in the exercise of his best discretion, endeavor to enter the port and fail, the insurer is not discharged. If the vessel approach a port in the night, he must make signals for a pilot, and wait a reasonable time for one; and if he attempt to enter the port without one, except in case of extreme necessity, the insurers are discharged. Pilotage constitutes a lien upon the vessel, and may be prosecuted in admiralty. But the pilot must be employed by some person rightfully in possession of the vessel. A pilot can not recover for piloting into an enemy's port.

Great Britain.—Under most charter parties, with the exception of those made for vessels in the coal trade in England, the charge for pilotage is paid by the charterers. Many ports enjoy separate and distinct jurisdictions for the appointment and government of pilots, and the regulations of the rates of pilotage. These jurisdictions are exercised by corporations and other bodies, the privileges of which have been granted either by ancient charters or by parliamentary. Among the many corporations so established, the most important are those of the Trinity House of Deptford Strand, whose jurisdiction is the most extensive; and of the Trinity Houses of Hull and Newcastle. The bodies are authorized within their districts to determine the qualifications of pilots, license them, make regulations for their government, fix and alter pilotage rates, and arrange the limits of the pilotage districts, subject, however, to the special provisions contained in the Merchants' Shipping Act of 1854. The regulations of which are given in summary, as follows:

It is questionable whether the Trinity House may revoke a pilot's license without hearing him; but if, after hearing him, it revoke his license, its decision is binding. The application of the Merchants' Shipping Act of 1854 applies only to the United Kingdom.

Powers of Pilotage Authorities.—Every pilotage authority shall retain all powers and jurisdiction which it now possesses, so far, and only so far, as they are consistent with the provision of the general act. Every pilotage authority has the power to exempt ships from being compelled to employ pilots; also to license pilots; to make regulations as to pilot-boats; to make regulations for the government of pilots; to alter rates of pilotage; to limit pilotage districts—all being within their district.

Power of Appeal to Board of Trade.—If the greater number of qualified pilots belonging to any port, or the local marine board, or any number of owners of ships, masters or insurers, consider themselves aggrieved by any regulations enforced by the pilotage authority, they may appeal to the Board of Trade; and the consequent decision shall be deemed conclusive.

Spain.—No one can be a pilot or officer of a merchant ship without having obtained a license. In case of decease, absence, or illness of the captain, the pilot takes his place, and incurs all his responsibility. The pilot can not change the course, unless the captain agrees to it. In case of difference of opinion, the pilot shall explain his reasons to the other officers; and if the captain persists in his orders, the pilot shall enter his protest in the navigation book.

Russia.—The pilot should look after the vessel, the embarkation and debarkation of merchandise, keep a registry of all that passes on board and of the observations. He owes obedience only to the captain, and should never quit the vessel when the captain is absent unless forced to do so.

Portugal.—The pilot who from ignorance, negligence, or design, loses, or exposes a vessel to damage, is bound to repair her, and is liable to be revoked and pursued by criminal process.

United States.—An act of Congress authorizes all States to make their own pilotage laws, and questions under these laws are cognizable in the State courts. No one can act as pilot, and claim the compensation allowed by law for the service, unless duly appointed. And he should always have with him his commission, which usually designates the largest vessel he may pilot, or that which draws the most water. If a pilot offers himself to a ship that has no pilot, and is entering or leaving a harbor, and has not reached certain geogra ical limits, the ship must pay him pilotage fees, whether his services are accepted or not. As soon as the pilot stands on deck he has command of the ship. But it remains the master's duty and power, in case of obvious and certain disability, or dangerous ignorance or error, to disobey the pilot, and dispossess him of his authority. If a ship neglect to take a pilot when it should and can do so, the owners will be answerable in damages to shippers and others for any loss which may be caused by such neglect or refusal. Pilots are answerable for any damage resulting from their own negligence or default, and have been held strictly to this liability. The owner is also liable on general principles for the default of the pilot, who is his servant.

The laws passed by the United States concerning pilots are comprehended in the following: August 7, 1789—"That all pilots in the bays, inlets, rivers, harbors, and ports of the United States shall continue to be regulated in conformity with the existing laws of the States respectively wherein such pilots may be, or with such laws as the States may respectively hereafter enact for the purpose, until further provision shall be made by Congress." March 2, 1837—"That it shall be lawful for the master or commander of any vessel coming into or going out of any port situated upon waters which are the boundary between two States, to employ any pilot duly licensed or authorized by the laws of either of the States bounded on the said waters, to pilot said vessels to or from said port; any law, usage, or custom to the contrary notwithstanding."

Maine.—Pilots are appointed by the Governor and Council upon the recommendation of a majority of the ship-owners and masters in the port for which they are appointed. Bonds are required to the amount of $5000 for the faithful discharge of the duties, and the pilots are liable for damages from neglect or unskillfulness. Any master may pilot his own vessel.

New Hampshire.—The appointment of pilots is the same as in Maine. Pilots must take charge of vessels drawing over nine feet, except coasting vessels. Bonds for $1000 are required for a faithful performance of duties. Masters may pilot their vessels when outward bound, and pay no pilotage. But vessels inward bound must pay half pilotage if they refuse a pilot, unless the vessel be within the light-house before a pilot offers, in which case no pilotage is due unless a pilot is employed. The Governor and Council regulate the fees for pilotage, and suspend or remove pilots for misconduct.

Massachusetts.—The Governor appoints pilots, except for the ports of Boston, where two commissioners, and New Bedford, where five commissioners, have the appointing power. The pilots give bonds for $2000 for the faithful performance of their duties. All vessels, except fishing-vessels and coasting vessels of less than two hundred tons, and vessels trading within the State limits, are bound to employ pilots or pay full pilotage, unless no pilots offer before vessels have arrived within the following limits: viz., within the chops of the harbors of Salem, Marblehead, or Gloucester; within the garnet of Plymouth harbor, or within the bar of any barrel harbor, or within the entrance of Boston harbor, being a line drawn from Harding Rocks to the Outer Graves, and thence to Nahant Head. In such case the master may refuse pilot.

New York.—In this State, Sandy Hook pilots are appointed and regulated by the Pilot Commissioners, who are chosen by the Underwriters and Chamber of Commerce. Hell Gate pilots are appointed by the Governor, and subject to the regulations of the Port Wardens.

The rates of pilotage in and out of New York are as follows: For vessels drawing

14 feet or less...	Inward,	$2 44	.. Outward,	$1 81	per foot.
14 to 18 feet	"	3 06	.. "	2 12½	"
18 to 21 feet	"	3 69	.. "	2 75	"
21 feet or more .	"	4 31½	.. "	3 18¾	"

New Jersey.—Sandy Hook pilots for the ports of Jersey City, Newark, and Perth Amboy are appointed by commissioners. The regulations do not differ materially from those enacted in regard to the New York pilots.

Pennsylvania.—Pilots for Philadelphia are appointed by a Board of Wardens. There are three classes of pilots: the first for vessels of any description; the second for vessels drawing less than twelve feet; the third for vessels drawing less than nine feet. Unlicensed pilots are subject to fine and imprisonment. New Jersey and Delaware pilots have power to act without a special license. The first qualified pilot that offers is entitled to take charge of the vessel. A second or third grade pilot may act unless a superior pilot offers before the vessel passes Reedy Island. Coasting vessels pay no half pilotage.

Delaware.—Vessels of 75 tons and upward, unless owned in Delaware, must take a pilot or pay half pilotage.

Maryland.—Pilots for the Chesapeake Bay are appointed by a Pilot Board. Pilots are divided into the same classes as in Pennsylvania. Pilots must take the nearest vessel to shore, or in the most distress. Foreign vessels must take a pilot, if one offers, or pay full pilotage.

Virginia.—Pilots are appointed by a Board. Pilots are divided into three classes, as in Pennsylvania. Vessels other than coasters must take a pilot or pay full pilotage.

North Carolina.—Pilots are appointed by commissioners for each port. Vessels pay full pilotage when refusing a pilot.

South Carolina.—Pilots are appointed by commissioners. Pilots who bring vessels into port are entitled to carry them out. Vessels pay full pilotage to the first pilot offering, whether his services are accepted or not.

Alabama.—Pilots are licensed by the harbor-master and port wardens. Vessels pay half pilotage, if pilot is not accepted.

Louisiana.—The harbor-master and port warden of New Orleans appoint pilots. There are no river pilots. Vessels pay half pilotage to the pilot if his services are not accepted. If the Balize, or regular pilots, carry the vessel to New Orleans, the compensation is a matter of agreement.

Florida.—Pilots are appointed by Pilot Commissioners. Vessels pay half pilotage, refusing a pilot, if outward bound, and full pilotage when inward bound. —*See* KENT'S *Commentaries*, vol. iii.; PARSONS'S *Mercantile Law*; *Mercantile and Maritime Guide*; BLUNT'S *Shipmaster's Assistant*.

Pimento, Allspice, or **Jamaica Pepper** (Fr. *Poivre de Jamaïque*; Ger. *Nelkenpfeffer*; It. *Pimenti*), the fruit of the *Myrtus pimenta*, a beautiful tree which grows in great plenty on the hills on the north side of Jamaica. The berries are spherical, and, when ripe, of a black or dark purple color. But, as the pulp is in this state moist and glutinous, the berries are plucked when green; and being exposed in the sun to dry, they lose their green color, and become of a reddish brown. They are packed in bags and hogsheads for the European market. The more fragrant and smaller they are, the better are they accounted. They have an aromatic, agreeable odor, resembling that of a mixture of cinnamon, cloves, and nutmegs, with the warm, pungent taste of the clove. Pimento is used in medicine, but its principal use is in the seasoning of soups and other dishes. "The returns," says Mr. Bryan Edwards, "from a pimento walk in a favorable season are prodigious. A single tree has been known to yield 150 pounds of the raw fruit, or 100 pounds of the dried spice, there being commonly a loss in weight of one-third in curing; but this, like many other of the minor productions, is exceedingly uncertain, and perhaps a very plenteous crop occurs but once in five years. The price in the market, as may be supposed, fluctuates accordingly; but its average for some years past may be set down at 14 cents per pound."—Vol. ii. p. 872, ed. 1819.

IMPORTS OF PIMENTO INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30TH, 1856.

Pin, in *Commerce*, a little necessary instrument, made of brass wire, chiefly used by women in adjusting their dress. When the wire is received in the manufactory, it is wound off from one wheel to another, and passed through a circle of a smaller diameter in a piece of iron. Being thus reduced to its proper size, it is straightened by drawing it between iron pins fixed in a board in a zigzag manner. It is afterward cut into lengths of about four yards, and then into smaller pieces, every length being sufficient for six pins. Each end of these is ground to a point by boys, each of whom sits with two small grindstones before him, turned by a wheel. Taking up a handful, he applies the wires to the coarsest of the two stones, moving them round, that the points may not become flat. He then gives them a smoother and a sharper point on the other stone. A lad of twelve years of age can point 16,000 in an hour. When the wire is pointed a pin is taken off from each end, till it is cut into six pieces. The head is made solid by the present process; but by the old method it is a separate piece, and is made as follows: One piece of wire is with rapidity drawn round another, and the interior one being drawn out, leaves a hollow tube between the circumvolutions. It is then cut by shears, every two turns of the wire forming one head. These are softened by throwing them into iron pans, and placing them in a furnace till they are red hot. As soon as they are cold they are distributed to children, who sit with anvils and hammers before them. These they work with their feet, by means of a lathe. They take up one of the lengths, and thrust the blunt end into a quantity of heads which lie before them; then catching one at the extremity, they apply it immediately to the anvil and hammer, and by a motion or two of the foot the point and head are fixed together, in much less time than can be described, and with a dexterity that can only be acquired by practice. The pins are thrown into a copper, containing a solution of tin and wine lees. Here they remain for some time, and when taken out their brass color has become changed to a dull white. In order to give them a polish, they are now put into a tub containing a quantity of bran, which is set in motion by turning a shaft that runs through its centre; and thus, by means of friction, the pins become entirely bright. They are now separated from the bran, which is performed by a mode exactly similar to the winnowing of corn; the bran flying off, and leaving the pin behind it fit for sale.—E. A.

The manufacture of pins was commenced in the United States between 1812 and 1820. Among the first established were those at Bellevue and Greenwich, New York. Mr. Lemuel William Wright, of Massachusetts, obtained patents in the United States and in England, and commenced the manufacture at Lambeth, London. John J. Howe obtained patents in 1832–1834, in the United States and in England, and established the Howe Manufacturing Company in New York, which was afterward removed to Birmingham, Connecticut. Mr. Samuel Slocum obtained another patent, and in 1838 established a manufactory of pins at Poughkeepsie, New York. The "American Pin Company" has been established for some years at Waterbury, Connecticut, and is the leading manufactory of the kind in the United States. The improvements produced in the United States have been for several years adopted in England and other parts of Europe. —See *American Journal of Science*, xxxviii. 209; HUNT'S *Merchants' Magazine*, xxv. 641; *Economy of Manufactures*, by BABBAGE.

Pinchbeck (Ger. *Tomback*; Du. *Tombak*; Fr. *Tombac, Similor*; It. *Tombacco*; Sp. *Tambac, Tumbaga*), a name given to one of the many imitations of gold. By melting zinc in various proportions with copper or brass, some alloys result, the colors of which approach more or less to that of gold. This composition is frequently employed as a substitute for gold, in the formation of watch-cases, and various other articles of a like description. Pinchbeck is sometimes called *Tombac*, and sometimes *Similor*, and *Petit-or*.

Pine, or Fir, a species of forest tree, next, if not superior, to the oak, in point of utility and value. There are above twenty species of pine. They do not bear flat leaves, but a species of spines, which, however, are real leaves. They are mostly, though not all, avergreens; but the appearance of the tree, as well as the quality of the timber, varies with the species, and also with the situation in which it grows. Generally speaking, the timber is hardest and best in exposed cold situations, and where its growth is slow.

Scotch pine (*Pinus sylvestris*) is a native of the Scotch mountains, and of most northern parts of Europe; being common in Russia, Denmark, Sweden, Norway, and Lapland. It is straight, abruptly branched, rising in favorable situations to the height of eighty or ninety feet, and being from three to four feet in diameter. It is at perfection when seventy or eighty years old. The color of the wood differs considerably; it is generally of a reddish yellow, or of a honey yellow, of various degrees of brightness. It has no larger transverse septa, and it has a strong resinous odor and taste. In the best timber the annual rings are thin, not exceeding $\frac{1}{10}$th of an inch in thickness; the dark parts of the rings of a bright reddish color; the wood hard and dry to the feel, neither leaving a woolly surface after the saw, nor filling its teeth with resin. The best Norway is the finest of this kind, and the best Riga and Memel are not much inferior. The inferior sorts have thick annual rings; in some the dark parts of the ring are of a honey yellow, the wood heavy, and filled with a soft resinous matter, feels clammy, and chokes the saw. Timber of this kind is not durable, nor fit for bearing strains. In some inferior species the wood is spongy, contains less resinous matter, and presents a woolly surface after the saw. Swedish timber is often of this kind. Scotch fir is the most durable of the pine species. It was the opinion of the celebrated Mr. Brindley, "that red Riga deal, or pine wood, would endure as long as oak in all situations." Its lightness and stiffness render it superior to any other material for beams, girders, joists, rafters, etc. It is much used in joiners' work, as it is more easily wrought, stands better, is much cheaper, and is nearly, if not quite, as durable as oak. Scotch fir is exported from Norway and Sweden, under the name of *red-wood*. Norway exports no trees above eighteen inches diameter, consequently there is much sap-wood; but the heart-wood is both stronger and more durable than that of larger trees from other situations. Riga exports a considerable quantity under the name of masts and spars: pieces from eighteen to twenty-five inches diameter are called *masts*, and are usually seventy or eighty feet in length; those of less than eighteen inches diameter are called *spars*. Yellow deals and planks are imported from various parts of Norway, Sweden, Prussia, Russia, etc. Tar, pitch, and turpentine are obtained from the Scotch fir.—*See these titles.* When the tree has attained to a proper age it is not injured by the extraction of these products.

Spruce Pine.—Of this there are three species—the Norway spruce, or *Pinus abies;* white spruce, or *Pinus alba;* and black spruce, or *Pinus nigra*. These are noble trees, rising in straight stems from 150 to 200 feet in height. They yield the timber known by the name of *white fir*, or *deal*, from its always being imported in deals or planks. Deals imported from Christiana are in the highest estimation.—*See* CHRISTIANA. The trees are usually cut into three lengths, generally of about twelve feet each, and are afterward cut into deals by saw-mills, each length yielding three deals. The Norway spruce thrives very well in Britain, and produces timber little inferior to the foreign; it is somewhat softer, and the knots are extremely hard. The white spruce, or *Pinus alba*, is brought from British North America. The wood is not so resinous as the Norway spruce; it is tougher, lighter, and more liable to twist in drying. The black spruce, or *Pinus nigra*, is also an American tree; but it is not much imported into England. The black and white spruce derive their names from the color of the bark, the wood of both being of the same color. The color of spruce fir, or white deal, is yellowish or brownish white; the hard part of the annual ring a darker shade of the same color. It often has a silky lustre, especially in the American and British grown kinds. Each annual ring consists of two parts; the one hard, the other softer. The knots are generally very hard. The clear and straight-grained kinds are often tough, but not very difficult to work, and stand extremely well when properly seasoned. White deal, as imported, shrinks about $\frac{1}{10}$th part in becoming quite dry.

Weymouth Pine, or *White Pine* (*Pinus strobus*), is a native of North America. It is one of the largest and most useful of the American trees, and makes excellent masts; but it is not durable, nor fit for large timbers, being very subject to dry-rot. It has a peculiar odor.

The commercial value of pine is greater than that of any other wood, and it forms a large proportion of the lumber trade. The Northeastern States are supplied principally by Maine. The Middle States obtain their supplies from Michigan, New York, and Western Pennsylvania; the Northwestern States from Western Pennsylvania, Virginia, and Wisconsin.—*See* LUMBER TRADE.

Larch (*Pinus larix*). There are three species of this valuable tree—one European, and two American. The variety from the Italian Alps is the most esteemed, and has lately been extensively introduced into plantations in Great Britain. It is a straight and lofty tree, of rapid growth. A tree seventy-nine years of age was cut down at Blair Athol in 1817, which contained 252 cubic feet of timber; and one of eighty years of age, at Dunkeld, measured 300 cubic feet. The mean size of the trunk of the larch may be taken at 45 feet in length, and 33 inches diameter. The wood of the European larch is generally of a honey yellow color, the hard part of the annual rings of a redder cast; sometimes it is brownish white. In common with the other species of pine, each annual ring consists of a hard and a soft part. It generally has a silky lustre; its color is browner than that of the Scotch pine, and it is much tougher. It is more difficult to work than Riga or Memel timber, but the surface is better when once it is obtained. It bears driving bolts and nails better than any other species of resinous wood. When perfectly dry it stands well, but it warps much in seasoning. It is in all situations extremely durable. It is useful for every purpose of building, whether external or internal; it makes excellent ship timber, masts, boats, posts, rails, and furniture. It is peculiarly adapted for flooring boards, in situations where there is much wear, and for stair-cases; in the latter, its fine color, when rubbed with oil, is much preferable to that of the black oaken stair-cases to be seen in some old mansions. It is well adapted for doors, shutters, and the like; and, from the beautiful color of its wood when varnished, painting is not necessary.—(We have abstracted these particulars from Mr. TREDGOLD'S excellent work, *The Principles of Carpentry*, p. 209–217.)

Pine-apple, or **Ananas,** though a tropical fruit, is now extensively cultivated in hot-houses and gardens, and is well known to every one. When of a good sort and healthy, it is the most luscious, and perhaps the best fruit that is produced; and, when carefully cultivated, is superior, in point of quality, to that produced in the West Indies.

Pink, a vessel masted and rigged like other ships, only that this is built with a round stern, the heads and ribs compassing so that her ribs bulge out very much. This renders the pinks difficult to be boarded, and also enables them to carry great burdens, for which purpose they are often used.

Pinnace, a small vessel used at sea, with a square stern, having sails and oars, and carrying three masts,

chiefly employed to obtain intelligence, and to land men, etc. One of the boats of a man-of-war, used to carry the officers to and from the shore, is also called the *pinnace*.

Pint, a measure used chiefly in the measuring of liquids. The word is High Dutch, and signifies a little measure of wine. The English pint used to be of two sorts: the one for wine, the other for beer and ale. Two pints make a quart; two quarts a pottle; two pottles a gallon, etc. The pint, imperial liquid measure, contains 34·659 cubic inches.

Pipe, a wine measure, usually containing 105 (very nearly) imperial, or 126 wine gallons. Two pipes, or 210 imperial gallons, make a tun. But, in practice, the size of the pipe varies according to the description of wine it contains. Thus a pipe of port contains 138 wine gallons; of sherry, 130; of Lisbon and Bucellas, 140; of Madeira, 110; and of Vidonia, 120. The pipe of port, it is to be observed, is seldom accurately 138 gallons, and it is usual to charge what the vessel actually contains.

Pipe-clay, a species of clay abounding in Devonshire, and other parts of England, employed in the manufacture of various sorts of earthen-ware, and in bleaching.

Pipes, Amber (in Turkey). Prussia is almost the only country by which amber is furnished for ornamental purposes. M. Von Roy, an amber merchant, of Dantzig, is said to have been twenty-five years collecting the splendid specimens which he now possesses. The most extensive use of this elegant material is for the manufacture of the mouth-pieces of meerschaum pipes and hookahs. Up to the present day amber mouth-pieces continue in great request in the East, where they fetch very high prices; and almost all the Prussian amber is sold to the Turks for manufacturing. There were in the Turkish department of the Exhibition four amber mouth-pieces for pipes, which were collectively worth £1000. It may serve in some measure to explain the peculiar favor which amber is held in by the Turks, that there is a current belief that amber is incapable of transmitting infection; it is deemed a mark of politeness to hand an amber pipe to a stranger.

Meerschaums.—The clay of which these are made is procured chiefly in Asia Minor, but also in Spain, Greece, and Moravia. The manufacture of pipes from the clay is carried on with especial care at Vienna and Pesth. The meerschaum is soaked in a liquefied composition of wax, oil, and fat, the absorption of which occasions the colors assumed by the pipe after smoking. Occasionally the bowls are artificially stained by dipping them in a solution of copperas and other substances before the application of the wax composition. The carving of the bowls is often difficult work, owing to the occurrence of a kind of clay mixed up with and harder than the meerschaum. The large quantity of parings left in roughing out the bowls would entail considerable loss, unless some process had been devised for using them. This has been done; the parings are employed in making the kind of meerschaum bowls called *massa-bowls*. The parings are ground to a fine powder, boiled in water, and moulded into blocks, with or without the addition of clay. The blocks are allowed to dry, and then a pipe-bowl is fashioned from each. These bowls are distinguished from the real meerschaum chiefly by being rather heavier. Meerschaum bowls have been produced so large and so elaborately carved as to be valued at five hundred dollars each.

Piracy consists in committing those acts of robbery and violence upon the seas that, if committed upon land, would amount to a felony. Pirates hold no commission or delegated authority from any sovereign or state, empowering them to attack others. They can, therefore, be only regarded in the light of robbers or assassins. They are, as Cicero has truly stated, the common enemies of all (*communes hostes omnium*); and the law of nations gives to every one the right to pursue and exterminate them without any previous declaration of war; but it is not allowed to kill them without trial, except in battle. Those who surrender, or are taken prisoners, must be brought before the proper magistrates, and dealt with according to law. By the ancient common law of England, piracy, if committed by a *subject*, was held to be a species of treason, being contrary to his natural allegiance; and, by an *alien*, to be felony only; but since the statute of treasons (25 Edw. III. c. 2) it is held to be only felony in a subject. Formerly this offense was only cognizable by the admiralty courts, which proceed by the rules of the civil law; but it being inconsistent with the liberties of the nation that any man's life should be taken away unless by the judgment of his peers, the statute 28 Hen. VIII. c. 15, established a new jurisdiction for this purpose, which proceeds according to the course of common law. It was formerly a question whether the Algerines, and other African states, should be considered pirates; but, however exceptionable their conduct might have been on many occasions, and however hostile their policy might be to the interests of humanity, still, as they had been subjected to what may be called regular governments, and had been admitted to enter into treaties with other powers, they could not be treated as pirates. Pirates having no right to make conquests, or to seize upon what belongs to others, capture by them does not divest the owner of his property. At an early period of English history a law was made for the restitution of property taken by pirates, if found within the realm, whether belonging to strangers or Englishmen; but any foreigner suing upon this statute must prove that at the time of the capture his own sovereign and the sovereign of the captor were in mutual amity; for it is held that piracy can not be committed by the subjects of states at war with each other. Piracy was almost universally practiced in the Heroic Ages. Instead of being esteemed infamous, it was supposed to be honorable.—*Latrocinium maris gloriæ habebatur.*—JUSTINIAN, lib. xliii. Menelaus, in the Odyssey, does not hesitate to inform his guests, who admired his riches, that they were the fruit of his piratical expeditions (lib. iv. ver. 90); and such, indeed, was the way in which most of the Greek princes amassed great wealth.—GOGUET, *Origin of Laws.* The prevalence of this piratical spirit in these early ages may, perhaps, be explained by the infinite number of small, independent states into which the country was divided, and the violent animosity constantly subsisting among them. In this way ferocious and predatory habits were universally diffused and kept alive; and it is not to be supposed that those who were at all times liable to be attacked by hosts of enemies should very accurately examine the grounds upon which they attacked others. According, however, as a more improved system of government grew up, Greece, and a few states, as Athens, Corinth, etc., had attained to distinction by their naval power, piracy was made a capital offense; but though repressed, it was never entirely put down. Cilicia was at all times the great strong-hold of the pirates of antiquity: and in consequence of the decline of the maritime forces of Athens, Rhodes, etc., which had kept them in check, they increased so much in numbers and audacity as to insult the majesty of Rome herself; so that it became necessary to send Pompey against them, with a large fleet and army, and more extensive powers than had been ever previously conferred on any Roman general.

During the anarchy of the Middle Ages, when every baron considered himself a sort of independent prince, entitled to make war on others, piracy was universally practiced. The famous Hanseatic League was formed chiefly for the purpose of protecting the ships of the confederated cities from the attacks of the pirates by which the Baltic was then infested. The nuisance was not finally abated in Europe till the feudal system had been subverted, and the ascendency of the law every

where secured. In more modern times, some of the smaller West India islands have been the great resort of pirates: latterly, however, they have been driven from most of their haunts in that quarter. They are still not unfrequently met with in the Indian seas east of Sumatra.—M'Culloch's *Com. Dict.*

Piracy is robbery, or a forcible depredation on the high seas, without lawful authority, and done *animo furandi*, and in the spirit and intention of universal hostility. It is the same offense at sea with robbery on land; and all the writers on the law of nations, and on the maritime law of Europe, agree in this definition of piracy. Pirates have been regarded by all civilized nations as the enemies of the human race, and the most atrocious violators of the universal law of society. They are every where pursued and punished with death; and the severity with which the law has animadverted upon this crime arises from its enormity and danger, the cruelty that accompanies it, the necessity of checking it, the difficulty of detection, and the facility with which robberies may be committed upon pacific traders in the solitudes of the ocean. Every nation has a right to attack and exterminate them without any declaration of war; for though pirates may form a loose and temporary association among themselves, and re-establish in some degree those laws of justice which they have violated with the rest of the world, yet they are not considered as a national body, or entitled to the laws of war, as one of the community of nations. They acquire no rights by conquest; and the law of nations, and the municipal law of every country, authorize the true owner to reclaim his property taken by pirates, wherever it can be found, and they do not recognize any title to be derived from an act of piracy. The principle that *a piratis et latronibus capta dominium non mutant*, is the received opinion of ancient civilians and modern writers on general jurisprudence, and the same doctrine was maintained in the English courts of common law prior to the great modern improvements made in the science of the law of nations.

By the Constitution of the United States, Congress is authorized to define and punish piracies and felonies committed on the high seas, and offenses against the law of nations. In pursuance of the authority it was declared, by the act of Congress of April 30, 1790, c. 9, sec. 8, that murder or robbery committed on the high seas, or in any river, harbor, or bay, out of the jurisdiction of any particular state, or any other offense, which, if committed within the body of a county, would, by the laws of the United States, be punishable with death, should be adjudged to be piracy or felony, and punishable with death. It was further declared, that if any captain or mariner should piratically or feloniously run away with any vessel, or any goods or merchandise to the value of fifty dollars, or should yield up any such vessel voluntarily to pirates; or if any seaman should forcibly endeavor to hinder his commander from defending the ship or goods committed to his trust, or should make a revolt in the ship, every such offender should be adjudged a pirate and felon, and be punishable with death. And by the act of March 3, 1819, c. 76, sec. 5, Congress declared, that if any such person on the high seas should commit the crime *of piracy as defined by the law of nations*, he should, on conviction, suffer death. This act was but temporary in its limitation, and has expired; but it was again declared, and essentially to the same effect, by the act of Congress, 15th of May, 1820, c. 113, sec. 3, that if any person upon the high seas, or in any open roadstead or bay or river, where the sea ebbs and flows, commits the crime of robbery, in or upon any vessel, or the lading thereof, or the crew, he shall be adjudged a pirate. So if any person, engaged in any piratical enterprise, or belonging to the crew of any piratical vessel, should land and commit robbery on shore, such an offender shall also be adjudged a pirate. The statute in this respect seems to be only declaratory of the law of nations; and upon the doctrine of the case of Lind *v.* Rodney, such plunder and robbery ashore by the crew, and with the aid of vessels, is a marine case, and of admiralty jurisdiction. The statute further declared, that the above provision was not to be construed to deprive any particular State of its jurisdiction over such offenses when committed within the body of a county, or to authorize the courts of the United States to try any such offenders, after conviction or acquittance, for the same offense in a State court.

There can be no doubt of the right of Congress to pass laws punishing pirates, though they may be foreigners, and may have committed no particular offense against the United States. It is of no importance, for the purpose of giving jurisdiction, on *whom* or *when* a piratical act has been committed. A pirate, who is one by the law of nations, may be tried and punished in any country where he may be found, for he is reputed to be out of the protection of all laws and privileges. The statute of any government may declare an offense committed on board its own vessels to be piracy, and such offense will be punishable exclusively by the nation which passes the statute. But piracy, under the law of nations, is an offense against all nations, and punishable by all.—Kent's *Commentaries*, vol 1.

Liability of Insurers.—There can be no piracy or robbery without violence; but this is not necessary to constitute the crime of theft. Piracy and robbery are most usually committed by strangers to the ship; they may, however, be committed by the crew; and the insurers are answerable for such a loss, unless it arise from the fault of the owner. If theft be committed by the crew, we should still hold the insurers liable. This may be doubtful; but insurers regard it as at least possible, and provide against it by the phrase, "assailing thieves." This excludes theft without violence, and perhaps all theft by those lawfully on board the vessel, as a part of the ship's company. If, after shipwreck, the property is stolen, the insurers are liable, and would probably be so if there were no insurance against theft, if this was a direct effect of the wrecking.—Parsons's *Mercantile Law*. The subjects of pirates and piracy have been discussed in the following works: Niles's *Register*, xvlii. 275, xxxii. 302, xx. 59, xxvii. 391, xxv. 157, xxvii. 138. xxiii. 211; Hunt's *Merchants' Magazine*, xiii. 450, 526, xlv. 89; *Edinburgh Review*, lxviii 33, xxvi. 449; Littell's *Museum*, xxv. 337, xxvi. 266.

Pistachia, or **Pistachio Nuts** (Ger. *Pistaschen*; Du. *Pistasjes*; Fr *Pistaches*; It. *Pistacchi, Fistucchi*; Sp. *Alfocigos*; Lat. *Pistaciæ*), the fruit of the *Pistachia vera*, a kind of turpentine-tree. It grows naturally in Arabia, Persia, and Syria; also in Sicily, whence the nuts are annually brought to us. They are oblong and pointed, about the size and shape of a filbert, including a kernel of a pale greenish color, covered with a yellowish or reddish skin. They have a pleasant, sweetish, unctuous taste, resembling that of sweet almonds; their principal difference from which consists in their having a greater degree of sweetness, accompanied with a light grateful flavor, and in being more oily. Pistachias imported from the East are superior to those raised in Europe.—Lewis's *Materia Med.*

Pistols. These are the smallest sort of fire-arms, carried sometimes on the saddle-bow, sometimes in a girdle round the waist, sometimes in the pocket, etc.—Pardon. The pistol was first used by the cavalry of England, in 1444.

The manufacture of guns and pistols in the United States has become an active one. Colt's Revolvers have acquired a reputation throughout Europe and South America, as well as the United States. His principal factory is located near Hartford, Connecticut. "It is so well ordered, so complete, so striking in its results, that all engaged in manufacture may learn something from it; it is in itself one large machine, well oiled too, which takes in at one end a shapeless

lump of iron, and a piece of wood, and puts out at the other a beautifully finished arm which you may load and fire six balls from separately in three-quarters of a minute, after a certain amount of practice. In each pistol there are fifty-three distinct pieces, including fourteen screws, and for the formation of these forty or forty-five separate machines co-operate, hammering, milling, cutting, drilling, punching, riffling, and shaving; all put into motion by a gallon of water 'in a violent perspiration;' in other words, a twenty-horse power steam-engine. Some of the machines are especially beautiful: look at that for riffling the barrels, for example, with the brush to keep the cutters clean; and the one near it for drilling the six chambers around the central boring in the solid cylinder, where accuracy is so indispensable. That regular irregularity, the eccentric, plays an important part in this, as it does in the hammering machine below—the machine patented by Rider. In one week they turned out 525 perfect pistols here, and there are the means for making 800 or 900 a week, if it were necessary to do so."—*London Builder.*

Pistols were first used by the Germans. Bellay mentions them in the year 1544. In the time of Francis I. and under Henry II. the German horsemen, *des reiters*, were called pistoliers. The derivation of this term is uncertain. Frisch conjectures that it may have arisen from pistillo or stiopo, because pistols used to have large knobs on the handles. Daniel and others think that the name comes from Pistoja, in Tuscany, where they were first manufactured. He says he saw an old pistol that, with the exception of the ramrod, was all iron. During the latter part of the last century many ingenious persons directed their attention to the improvement of fire-arms, with a view to simplify their construction, to render them more effective, and to combine safety with celerity in firing. One of the most marked advancements was effected by Mr. Henry Nock, and patented by him in England in 1787. Previous to this the breeching or plug of a gun was a solid lump of iron, screwed into one end of the barrel, the touch-hole being drilled through the side of the barrel above it. Another most marked improvement was the introduction and adaptation of fulminating powder, for igniting the charge in the chamber of the breech; and for which the Rev. Mr. Forsyth obtained a patent in Great Britain, in 1807. The perfection of a proper fulminating powder was long a matter of great difficulty. Other changes were suggested, but not of a practical kind. One made by Mr. E. H. Collier, of Boston, Massachusetts, in 1818; and another by Mr. Wheeler, of Boston, in 1819.

The first valuable improvements made by Colonel Samuel Colt, of Connecticut, in the construction of the pistol, were made public in the year 1835. The original conception of Colonel Colt in regard to fire-arms was the combination of a number of long barrels to rotate upon a spindle, by the act of cocking the lock, in the same manner that they have since been made by others who claim to have originated the plan; but as objections arose from the weight and bulk of the arm, in his study to obviate them, the idea of a single barrel and a chambered breech suggested itself to him. Although without the pecuniary means of then practically testing his convictions, he made a small wooden model of his conception, which he possesses at the present day. He then assiduously pursued his calling as a scientific lecturer, and from its rewards procured the aid to manufacture specimen arms, which in their practical results exceeded even his most sanguine expectations; and in 1835 he received his first patent from the Government of the United States.

Colonel Colt's first manufactory of fire-arms was located at Paterson, New Jersey, in the year 1836, with a capital of $300,000. This continued in operation until the year 1842, when it was relinquished as unprofitable. The Florida war of 1837–'38 created a demand for, and gave practical demonstration of the great value of, the repeating fire-arms patented by him. They were also used with great effect in the Texan revolution and war; and afterward in the war with Mexico (1846–'47), when a contract was made by him with the government for the supply of one thousand of the improved arms. A temporary manufactory was established for this purpose at Whitneyville, Connecticut. This was succeeded by the present extensive factory at or near Hartford, on the Connecticut River, which was finished and in successful operation in the year 1855, with a capital of $1,250,000. These buildings present a front of 500 feet. The repeating principle has also been successfully applied by Colonel Colt to rifles and carbines, several varieties of which are constantly in the course of completion in the armory. Lately the demand for the sporting rifle has increased wonderfully, which increase will, no doubt, be much augmented as their superiority is more generally practically demonstrated by our hardy backwoodsmen; and the day is not distant when regiments of riflemen will be equipped with Colt's revolvers.

Within the last year still another style of pistol has been introduced. It is called "Colt's new Model," and by some it is preferred to either of the others. Undoubtedly this is a matter of fancy with the party using the arm, as in some cases individuals yet prefer Colt's first to any arm that was ever manufactured. The arms are of several sizes, and weigh as follows:

	Pounds.	Ounces.
The military rifle, barrel 36 inches, fitted with improved bayonet	11	8
Sporting rifle, barrel from 18 to 30 inches, average	9	
The army or holster pistol	4	4
The navy or belt pistol	2	6
The pocket pistol, barrel 6 inches	1	12
The pocket pistol, barrel 5 inches	1	10
The pocket pistol, barrel 4 inches	1	8

These are kinds that are constantly in the course of construction; of course many other varieties are made by special order.

Of the improved pistol, over 138,000 had been manufactured here up to January, 1857. Nearly eight hundred men are ordinarily employed in this work alone. This result is the fruit of a market for arms, not confined to the United States, but extending over both the Americas; more or less to the Indies, East and West; to Egypt—even to distant Australia; to remote Asiatic tribes assembled at the great fairs of Novgorod; and over Europe generally, but especially to England. Here the arms of Colonel Colt, first introduced in splendid style through the World's Fair, were warmly welcomed, and led to the speedy establishment in London of an extensive armory for their manufacture, and to their rapid adoption into the British army and naval service.—*United States Magazine*, March, 1857.

See FIRE-ARMS.

Pitcairn's Island. A small solitary island in the Pacific Ocean, seen by Cook in 1773, and noted for being colonized by ten mutineers from the ship *Bounty*, Captain Bligh, in 1789, from which time till 1814 they (or rather their descendants) remained here unknown. Soil fertile, but porous, and rather defective in water; well wooded, and climate healthful; thermometer ranging from 59° to 89° Fahr. Prevailing winds southwest and east-southeast, but it is beyond the limits of the regular trade-winds. It is surrounded by rocky shores, and has only one accessible landing-place at Bounty Bay. The cocoa-nut, plantain, banana, and bread-fruit trees flourish, hibiscus, or cloth tree, banyan-tree, orange, and others; and the potato, sweet potato, yams, water-melons, pumpkin, taro, sugar-cane, ginger, turmeric, tobacco, tea-plant, and maize, are cultivated. The island contained no indigenous quadrupeds, but goats, hogs, and poultry have been imported. In 1790 this island was resorted to by the mutineers of the *Bounty*, consisting of nine British sailors, six native Tahitian men, and twelve women.

In consequence of various discords and massacres, at the end of ten years there remained only one Englishman, Adams, the Tahitian females, and nineteen children, their offspring. Under the superintendence of this man the children were educated and trained up to habits of industry and morality. In 1825 Captain Beechey found a most interesting and intelligent colony of sixty-six persons. In 1831, by the somewhat imprudent sanction of the British government, the colony, numbering eighty-seven persons, was transferred to Tahiti. After remaining five months there, and losing twelve of their number by death, the colony, at their own solicitation, were again reinstated in their native island. In 1840 the population amounted to 75 males and 74 females, in all 149; of these, three were Englishmen, one a native Tahitian woman, the only remaining female of the original migration, and the remainder were natives of the island. They live chiefly on yams, potatoes, and other vegetables, which they raise by their own labor. From the remains of burial-grounds, the island would appear to have been occupied by inhabitants at a period antecedent to the visit of the mutineers of the *Bounty*. It was seen by Carteret in 1767, and named by him after one of his officers.

Pitch (Ger. *Pech;* Fr. *Poix, Brai;* It. *Pece;* Sp. *Pez*, Russ. *Smola gustaja*), the residuum which remains on inspissating tar, or boiling it down to dryness. It is extensively used in ship-building, and for other purposes.—*See* NAVAL STORES.

Pittsburgh, city, port of entry, and capital of Alleghany county, Pennsylvania, is situated at the conflux of the Alleghany and Monongahela rivers, where they form the Ohio, which is here a quarter of a mile wide. It is in 40° 32′ N. lat., and 80° 2′ W. long., 357 m. *via* Pennsylvania Railroad from Philadelphia, 247 west-northwest of Harrisburg, 226 from Washington, D. C., and 2044 above New Orleans by the course of the river. Population in 1810, 4768; in 1820, 7248; in 1830, 12,568; in 1840, 21,115; in 1850, 46,601; in 1854, the city and immediate vicinity estimated at 110,000. It was originally laid out on the northeast bank of the Monongahela, after the model of Philadelphia, with streets running parallel with the rivers, and others crossing them at right angles. The streets on the Alleghany are laid out on a similar plan, and hence a short distance from the Alleghany the old and new streets meet in oblique directions. The Alleghany River is spanned by three bridges, which, with several steam ferries, connect the city with the suburbs. The Pennsylvania Canal crosses the river by an aqueduct, and there is a suspension-bridge over the Monongahela.

As a manufacturing city, Pittsburgh is second in the State only to Philadelphia. In 1850 it had thirteen rolling-mills, with a capital of $5,000,000, employing 2500 hands, consuming 60,000 tons of pig metal, and producing annually bar iron and nails to the value of $4,000,000; thirty large founderies, with an aggregate capital of $2,000,000, and 2500 hands, using 20,000 tons of pig iron, and yielding articles valued at $2,000,000 annually; two establishments for manufacturing locks, latches, coffee-mills, scales, and other iron casting, employing 500 hands, and a capital of $250,000, using 1200 tons metal, and producing annually to the value of $3,000,000; five large cotton factories—capital $1,500,000, hands 1560, cotton consumed 15,000 bales, and products valued at upward of $1,500,000 annually; eight flint-glass manufactories—capital $300,000, hands 500, and producing various articles of glass, in the manufacture of which 150 tons lead and 200 tons of pearlash are used, to the value of $400,000 annually; seven phial furnaces and eleven window-glass factories—capital $250,000, hands 600, and annual products $600,000; one soda-ash factory, employing 75 hands, and producing annually 1500 tons; one copper-smelting house, producing 600 tons refined copper annually, valued at $380 per ton; one rolling-mill, producing annually 300 tons sheathing and brazier's copper; five white-lead factories—capital $150,000, hands 60, and producing 150,000 kegs annually, worth $200,000. There are also a number of manufactories of the smaller sizes of iron, several extensive manufactories of axes, hatchets, spring-steel, steel springs, axles, anvils, vices, mills, cross-cut and other saws, gun barrels, shovels, spades, forks, hoes, cut tacks, brads, etc. The products of the manufactures in the aggregate are valued at between $50,000,000 and $60,000,000 annually. There are consumed about 12,000,000 bushels of coal annually, worth $600,000, and an equal quantity is exported from the city, giving employment constantly to 4000 hands.

Plains. In Geography, the general term for all those parts of the dry land which can not properly be called mountainous, and which compose by far the greater part of the earth's surface. Plains have different physical appearances according to their geographical position, and the peculiar characteristics of each have procured for them different names; thus we have the steppes of Asia, the deserts of Africa, the pampas of South America, and the prairies or savannas of North America. *See these different terms.*

Plane, a forest tree, of which there are two species; the Oriental plane (*Platanus Orientalis*), and the Occidental plane (*Platanus Occidentalis*). The Oriental plane is a native of the Levant, and other Eastern countries, and is considered one of the finest of trees. It grows to about 60 feet in height, and has been known to exceed eight feet in diameter. Its wood is much like beech, but more figured, and is used for furniture and such like articles. The Occidental plane is a native of North America, and is one of the largest of the American trees, being sometimes more than 12 feet in diameter. The wood of the Occidental plane is harder than that of the Oriental. It is very durable in water. The tree known by the name of plane in England is the sycamore, or great maple (*Acer pseudo-platanus*). It is a large tree, grows quickly, and stands the sea-spray better than most trees. The timber is very close and compact, easily wrought, and not liable either to splinter or warp. It is generally of a brownish white or yellowish white color, and sometimes it is very beautifully curled and mottled. In this state it takes a fine polish, and bears varnishing well. It is chiefly used in the manufacture of saddle-trees, wooden dishes, and a variety of articles of furniture and machinery. When kept dry, and protected from worms, it is pretty durable; but it is quite as liable as beech to be attacked by them.—TREDGOLD, p. 196.

Plane Sailing, in *Navigation*, is the art of determining the ship's place, on the supposition that she is moving on a plane, or that the surface of the ocean is plane instead of being spherical. On account of the magnitude of the terrestrial radius, this supposition may be adopted for short distances without leading to great errors; and it affords great facilities in calculation, for the place of the ship is found by the solution of a right-angled plane triangle. The part of the meridian between the ship and the parallel of latitude of the place whence she departed forms the perpendicular of the triangle; the distance on the parallel between the place of departure and the foot of the perpendicular is the base of the triangle (technically called the departure); and the distance sailed is the hypothenuse. The angle at the ship is called the course, and the other acute angle the complement of the course. Now, of these four things, the perpendicular, the departure, the distance sailed, and the course, any two being given, the triangle can be laid down on the chart, and all the other parts of it found.—*See* NAVIGATION.

Planks (Ger. and Du. *Planken;* Da. *Planker;* Sw. *Plankor;* Fr. *Planches, Boraages;* Russ. *Tolstiie oloski*), thick strong boards, cut from various kinds of wood, especially oak and pine. Planks are usually of the thickness of from 1 inch to 4. They are exported in large quantities from the northern parts of Europe, particularly from the ports of Christiana, Dantzic, Archi-

angel, Petersburg, Narva, Reval, Riga, and Memel, as well as from several parts of North America.—*See* LUMBER TRADE.

Plantain, or Banana, the pulpy fruit of the *Musa paradisiaca*, an herbaceous plant, extensively cultivated in most inter-tropical countries, but especially in Mexico. It is not, like most other fruits, used merely as an occasional luxury, but is rather an established article of subsistence. Being long and extensively cultivated, it has diverged into numerous varieties, the fruit of which differs materially in size, flavor, and color. That of some is not above two or three inches long, while that of others is not much short of a foot; some sorts are sweet, and of a flavor not unlike nor inferior to that of a good mellow pear; but the larger kind are, for the most part, coarse and farinaceous. The latter are either used fresh or dried in the sun, in which latter state they are occasionally ground into meal and made into bread. In Mexico the sweeter sorts are frequently pressed and dried, as figs are in Europe; and, while they are not very inferior to the last-mentioned fruit, they are infinitely cheaper. "I doubt," says M. Humboldt, "whether there be any other plant that produces so great a quantity of nutritive substance in so small a space. Eight or nine months after the sucker is planted, it begins to develop its cluster. The fruit may be gathered in the tenth and eleventh month. When the stalk is cut, there is always found, among the numerous shoots that have taken root, a sprout (*pimpollo*), which, being 2-3ds the height of its parent plant, bears fruit three months later. Thus a plantation of bananas perpetuates itself, without requiring any care on the part of man, further than to cut the stalks when the fruit has ripened, and to stir the earth gently once or twice a year about the roots. A piece of ground of 100 square metres of surface will contain from 30 to 40 plants. During the course of a year this same piece of ground, reckoning the weight of the cluster at from 15 to 20 kilog. only, will yield 2000 kilog., or more than 4000 lbs., of nutritive substance. What a difference between this product and that of the cereal grasses in most parts of Europe! The same extent of land planted with wheat would not produce above 30 lbs., and not more than 90 lbs. of potatoes. Hence the product of the banana is to that of wheat as 133 to 1, and to that of potatoes as 44 to 1."—*Essai sur la Nouvelle Espagne.* The banana forms a principal part of the food of the people of Mexico; and the apathy and indolence of the natives in the *tierras calientes*, or hot regions, has been ascribed, and probably with good reason, to the facility with which it supplies them with subsistence. It is by no means in such extensive use in tropical Asia, and comes nowhere in it into competition with corn as an article of food.

Plaster, or **Plaister,** in building, a composition of lime, sometimes with sand, or other substance, to parget or cover the nudities of building.

Plaster of Paris, a preparation of several species of gypsum dug near Montmartre, a village in the neighborhood of Paris, and hence the name. The best sort is hard, white, shining, and marbly, being known by the name of *plaster-stone*, or *parget of Montmartre*. It will neither give fire with steel, nor ferment with aquafortis; but it calcines very freely and readily into a fine plaster, the use of which in building and casting statues is well known.

Plata (Rio De La), or the Plate River, one of the great rivers, or rather a great estuary of South America, in the Argentine Republic, formed by the junction of the Parana and Uruguay rivers, in lat. 34° S., long. 58° 30′ W., its basin lying south of those of the Amazon, Tocantins, and San Francisco, and its numerous tributaries draining most part of the Plata, Paraguay, and Uruguay territories, with considerable portions of Bolivia and Brazil. The estuary resulting from their union is 200 miles in length northwest to southeast, and where it joins the Atlantic Ocean, is 170 miles across (between Maldonado and Cape St. Antonio); its centre being about lat. 35° 30′ S., long. 56° W. Its muddy waters can be traced in the ocean 200 miles from its mouth. The total length of the Plata and the Paraguay has been estimated at nearly 2500 miles; and from the ocean to the island of Apipe in the Parana, at least 1250 miles, there is a continuous and safe navigation for vessels of 800 tons. The Aguapehy, an affluent of the Paraguay near lat. 15° 40′ S., long. 59° 20′ W., is separated only by a portage of three miles from the Alegre, a tributary of the Guapore, and were a canal to be made to connect the two streams, a complete system of internal navigation throughout nearly all South America would exist.—*See* PARAGUAY.

Plate, the denomination usually given to gold and silver wrought into articles of household furniture. It appears from PORTER'S *Progress of the Nation*, iii. 25, that the annual consumption of silver plate has increased from about 800,000 oz. at the commencement of the century, to about 1,050,000 oz. at present. Most persons may, perhaps, be inclined to think that this is not so great an increase as might have been anticipated from the increase of wealth and population. But it should be borne in mind that this account refers only to articles of standard silver and gold, and that the great consumption of the precious metals consists in plated and gilt articles, which are now made of a very superior quality. Owing also to the fact of old plate being held in the greatest estimation, but little of it is melted down to be remanufactured, so that the principal consumption is by new families.—*See* GOLD and PRECIOUS METALS.

Platina, a metal which, in respect of scarcity, beauty, ductility, and indestructibility, is hardly inferior to gold, was unknown in Europe till about the middle of last century, when it began to be imported in small quantities from South America. It has since been discovered in Estremadura in Spain, and more recently in the Ural Mountains in Asiatic Russia, where it is now raised in very considerable quantities. Platina is of a white color, like silver, but not so bright, and has no taste or smell. Its hardness is intermediate between copper and iron. Its specific gravity is about 21·5, that of gold being 19·3; so that it is the heaviest body with which we are acquainted. It is exceedingly ductile and malleable; it may be hammered out into very thin plates, and drawn into wires not exceeding 1-1940th of an inch in diameter. In these properties it is probably inferior to gold, but it seems to surpass all the other metals. Its tenacity is such, that a wire of platina 0·078 inch in diameter is capable of supporting a weight of 274·31 lbs. avoirdupois without breaking. It is one of the most infusible of all metals; but pieces of it may be welded together without difficulty when heated to whiteness. It is not in the smallest degree altered by the action of air or water.—THOMSON'S *Chemistry*. The late Dr. Wollaston discovered a method of fusing platina, and, consequently, of rendering it easily available in the arts. The Russians have within these few years issued platina coins of the value of 3, 6, and 20 silver roubles. Platina first began to be an object of attention in Russia in 1824, when 1 pood 33 lbs. were collected. In 1836 the produce amounted to 188 poods 42 lbs. In 1831 a piece of native platina was discovered at Demidoff's gold mines, weighing 29 lbs. 2½ zolt.—*Official Statements* published by the Russian government.

Plating. The art of covering copper and other metals with silver or gold: it is effected in various ways. Sometimes the silver is attached to and rolled out with the copper by pressure; sometimes the one metal is precipitated from its solutions upon the other; and of late manufacturers have availed themselves of electro-chemical decomposition for the purpose.

Platinum (so called from the Spanish word plata,

silver, on account of its color), a metal of a white color, exceedingly ductile, malleable, and difficult of fusion. It is the heaviest substance known, its specific gravity being 21·5. It undergoes no change from air or moisture, and is not attacked by any of the pure acids; it is dissolved by chlorine and nitro-muriatic acid, and is oxydized at high temperatures by pure potassa and lithia. It is only found in South America and in the Uralian Mountains: it is usually in small grains of a metallic lustre, associated or combined with palladium, rhodium, iridium, and osmium; and with copper, iron, lead, titanium, chromium, gold, and silver; it is also usually mixed with alluvial sand. The particles are seldom so large as a small pea, but sometimes lumps have been found of the size of a hazel-nut to that of a pigeon's egg. In 1826, it was first discovered in a vein associated with gold by Boussingault, in the province of Antioquia, in South America. When a perfectly clean surface of platinum is presented to a mixture of hydrogen and oxygen gas, it has the extraordinary property of causing them to combine so as to form water, and often with such rapidity as to render the metal red hot: *spongy platinum*, as it is usually called, obtained by heating the ammonio-muriate of platinum, is most effective in producing this extraordinary result; and a jet of hydrogen directed upon it may be inflamed by the metal thus ignited, a property which has been applied to the construction of convenient instruments for procuring a light. The equivalent of platinum is about 98. It is precipitated from its nitro-muriatic solution by sal ammoniac, which throws it down in the form of a yellow powder, composed of bichloride of platinum and sal ammoniac.

Platting, slips of bast, cane, straw, etc., woven or plaited for making into hats, etc.

Plumbago. *See* BLACK-LEAD.

Plums, the fruit of the *Prunus domestica*, are too well known to require any description. They were introduced into England in the 15th century, and are cultivated in all parts of the country. There are said to be nearly 300 varieties of plums.

Plum-tree (*Prunus domestica*). The *Prunus domestica* appears to be more widely diffused in its original locality than the apricot. It is believed to be indigenous to the south of Russia, Caucasus, the Himalayas, and to many parts of Europe. In England, and in some parts of the United States, it is sometimes found in hedges, but never truly wild. This species and many of its varieties are cultivated for ornament, or their fruit, in all the temperate countries of the habitable globe. Faulkner, in his *Kensington*, makes the plum a native of Asia, and an introduction into Europe of the Crusaders. Gough, in his *British Topography*, says that Lord Cromwell introduced the Perdrigon plum into England in the time of Henry VII. The introduction of this tree into the United States dates back to the earliest periods of their settlements. Several valuable and interesting varieties have originated in this country, among which the Bolmar or Washington plum stands conspicuous. The parent tree is said to have been purchased in a market in New York, about the end of the last century. It remained barren for several years, till, during a violent storm of thunder, the entire trunk was severed to the earth by lightning, and destroyed. The part remaining in the ground afterward threw up several vigorous shoots, which were allowed to remain and finally produce fruit. Trees of this variety were first sent to England in 1819, to Mr. Robert Barclay, of Bury Hill; and several others were sent to the London Horticultural Society in 1821, by Dr. Hosack, of New York. The wood of the *Prunus domestica* is hard, close, compact, beautifully veined, and susceptible of a fine polish. When dry, it weighs from forty to fifty pounds to a cubic foot, according to the age and growth of the tree. Its texture is silky, and when washed with lime-water its color is heightened, and may be preserved by the application of varnish or wax. Unfortunately for this tree, its wood is sometimes rotten at the heart. In France and Germany it is much sought after by turners, cabinet-makers, and the manufacturers of musical instruments. The leaves are sometimes given to cattle for forage. The use of the fruit in domestic economy for dessert, and for making tarts and puddings, is well known. In France plums are principally used dry or preserved, and enter extensively into commerce. The kinds usually employed for preserving are the Brignole, the prune d'Ast, the Perdrigon blanc, the prune d'Agen, and the Ste. Catherine. In warm countries plums or prunes are dried on hurdles by solar heat; but in cold climates artificial heat is employed; the fruit being exposed to the heat of an oven and to that of the sun on alternate days. Table prunes are prepared from the larger kinds of plums, as the green-gage, and Ste. Catherine; those employed in medicine from the Ste. Julienne. The former have a very sweet and agreeable taste, and the latter are somewhat austere. Fresh, ripe plums, taken in moderate quantities, are regarded as nutritive and wholesome; but in large quantities they readily disorder the bowels; and when immature, they still more easily excite ill effects. The medicinal prunes are employed as an agreeable, mild laxative for children, and are given during convalescence from febrile and inflammatory disorders in adults.—BROWNE'S *Trees of America*.

Plush (Fr. *Panne*, *Peluche*; Germ. *Wollsammet*, *Plüsch*) is a textile fabric, having a sort of velvet nap or shag upon one side. It is composed regularly of a woof of a single woolen thread, and a two-fold warp, the one wool of two threads twisted, the other goat's or camel's hair. There are also several sorts of plush made entirely of worsted. It is manufactured, like velvet, in a loom with three treadles; two of which separate and depress the woolen warp, and the third raises the hair-warp, whereupon the weaver, throwing the shuttle, passes the woof between the woolen and hair warp; afterward, laying a brass broach or needle under that of the hair, he cuts it with a knife (*see* FUSTIAN) destined for that use, running its fine, slender point along in the hollow of the guide-broach, to the end of a piece extended upon a table. Thus the surface of the plush receives its velvety appearance. This stuff is also made of cotton and silk.

Plymouth, a sea-port of England, on the east side of a peninsula between the rivers Plym and Tamar, at the head of Plymouth Sound; latitude of Mount Wise, 50° 22′ N., long. 4° 10′ 2″ W. The port of Plymouth is distinguished for its capacity and security; it is capable of containing 2000 sail, and is one of the best harbors in the world. It consists of three divisions: Suttonport, adjoining the town; Catwater, formed by an estuary of the Plym; and the Bay of Hamoaze. At the mouth of these harbors the great bay of Plymouth Sound forms an excellent roadstead, which is now completely secure by the erection of the breakwater across the entrance. This is an isolated mole at the entrance of the Sound 5100 feet long, and opposing a barrier to the heavy swell of the Atlantic. The Sound is three miles long and four miles wide, and forms the harbor of Davenport and Plymouth.

Point net is a style of lace formerly much in vogue, but now superseded by the bobbin-net manufacture.—*See* LACE.

Points of the Compass. In *Geography* and *Navigation*, the points of division of the circle representing the horizon, or of the compass card over which the magnetic needle is suspended. A diameter of the circle being drawn to represent the meridian, or north and south directions, and another at right angles to it to represent the directions east and west, the circle is thus divided into four quarters, each of which is subdivided into eight equal parts, so that the whole circle is divided into thirty-two equal parts; and the points

of division are termed the points of the compass. Each has a particular name, indicating its place with reference to the four principal or *cardinal points;* namely, the north, south, east, and west points.—*See* COMPASS.

Polar Sea, North. We are now able to draw with nearly geographical accuracy the boundaries of the North Polar Sea. A very large portion of the northern shores of Europe, Asia, and America, which circumscribe it, have been visited, and the position of most of their bays, headlands, and rivers, geographically ascertained. By casting our eye over the North Polar chart, it will be seen that the Polar Sea of that hemisphere is an immense circular basin, which communicates with the two great oceans of the world—the Atlantic and the Pacific—by two channels, the one separating America from Europe, and the other America from Asia. It will be seen that few points of the coasts of Europe and Asia, which occupy a full half of the circumscribing circle, extend much beyond the 70th parallel of latitude; and all these points have been passed by water, though at different points and by different persons, with the single exception of the Cape Cèvero Vastochnoi, which on the charts is made to extend to the latitude 75½°. The northern coast of America, with Old Greenland, and the two channels above mentioned, complete the circle, America extending about 80° of longitude, or just two ninths of the whole circle; and of this portion the whole coast has now been ascertained, with the exception of that part which lies between Cape Turnagain of Franklin, and the land at the bottom of Prince Regent's Inlet, which the gentlemen of the Hudson's Bay Company are now (1838) exploring. This being accomplished, we shall have the whole line of the northern coast of America completed. We may, therefore, state that the average of the degree of latitude of this coast is about the same as, or rather lower than, that of Europe and Asia, and the extent of the North Polar Sea may be considered as about 2400 geographical miles in diameter, or 7200 in circumference. The interior or central parts of this sea are very little known. Several islands are scattered over its southern extremities, the largest of which is Old Greenland, whose northern limit has not yet been passed; the others are, Spitzbergen, Nova Zembla, the islands of Liaknov, or, as some have been pleased to call them, New Siberia; the North Georgian Islands of Parry, and those which form the western lands of Baffin's Bay, to which may be added the Boothia Felix of Ross, which there is no doubt is an island. Besides these, there are a number of small alluvial islands, formed at the mouths of the several rivers of the two continents; but whether any, or what number of islands may exist nearer to the Pole, we must of course remain ignorant till the Polar Sea has been further explored.

For the little which is known of this sea, we are indebted to that spirit of discovery which showed itself immediately after a passage to the East Indies had been effected round the Cape of Good Hope; not so much, it is true, for the sake of geographical discovery as that of shortening the passage by sea to the eastern parts of the world. It was obvious that if a ship could proceed from the Atlantic to the Pacific on a great circle of the sphere, or nearly so, the distance, compared with the circuitous passage round Southern Africa or Southern America, would be prodigiously shortened. The voyage of Columbus had that object; but it was soon discovered that, from the Straits of Magelhaens to the Gulf of St. Lawrence there was an uninterrupted continuity of land. Of the northern regions the information obtained has been scanty and discouraging for such an enterprise. One of the Scandinavian pirates had, indeed, been driven by stress of weather, as early as the middle of the 9th century, upon an island to the northwest, to which, from its appearance, he gave the name of Snowland, which was afterward changed to that of Iceland, by the leader of the Norwegian colonists who took refuge on that inhospitable spot; but it was not till more than a century after this that Eric Randa discovered the southern part of Old Greenland, and there are grounds for believing that in the year 1001 some of these colonists discovered Newfoundland and the coast of Labrador.

Of the South Polar Sea little or nothing may be said to be known. Captain Cook, in the years 1773 and 1774, crossed the antarctic circle in *five* places only; in longitude 39½° east, where he advanced to latitude 67½°, and met with fields and detached pieces of ice; in longitudes 101° and 110° west, between which he proceeded to latitude 71° 10′ south, the farthest progress made by him toward the South Pole, where he was stopped, or at least deemed it prudent to return, on account of the fields and mountains of ice which were scattered over the surface of the sea; and in longitudes 136° and 148° west, between which he descended to latitude 68°, and saw many floating ice islands. There are, therefore, still remaining about 340 degrees of longitude in which the antarctic circle has not been crossed, and full half the circumference of the globe which has not been visited lower to the southward than the parallel of 60° south latitude.

Mr. Weddell, a master in the navy, proceeded some three degrees farther south than Cook; and since that, two ships of Mr. Enderby discovered a long tract of land, the extent of which they did not determine.

There was little doubt of the existence of high land in the South Polar Sea, though Cook discovered none beyond the Southern Thule, or Sandwich Land, on the parallel of 60°. Without high, precipitous land, those large icebergs which he met with floating among the fields of ice could not have been formed; the *hummocks* of ice, occasioned by the agitation of the sea, and the meeting of the *fields* or *flaws* in opposite directions, seldom rise to the height of twelve or fifteen feet above the surface. The Russians, indeed, on a recent voyage of discovery, are said to have fallen in with many islands about the 70th parallel of latitude. They also circumnavigated the Sandwich Land, which was left undetermined by Cook, and conjectured that it might be a part of the great Southern Continent, which occupied so much attention of the geographers and philosophers of the last century. This idea was renewed by the recent discovery of a very considerable extent of land to the southward of Cape Horn, in latitude 63°, and seen extending from longitude 55° to 65° west. As the eastern extremity had not been seen, and the winding of the coast was to northeast, it was conjectured that it might unite with the Southern Thule of Cook, and form the long-sought-for Southern Continent. It is said, however, that the Russians have also circumnavigated this land, and that it is composed of a great cluster of islands.

The land in question has been called South Shetland, but it is no new discovery. In the account of the voyage of *the five ships of Rotterdam*, under the command of Jacob Mahn and Simon de Cordes, to the South Seas, in the year 1599, it is stated that, on approaching the Strait of Magelhaens, the yacht commanded by Dirk Gherritz was separated from all the other ships, and was carried by tempestuous weather to the south of the Strait, to 64° south latitude, where they discovered a high country, with mountains, which were covered with snow, like the land of Norway. This land of Gherritz was marked on some of the old charts, but discontinued on the more modern ones, from the uncertainty of its position with regard to longitude. There can be no doubt of its identity with the modern South Shetland. It answered to the description of the mountains of Norway, covered with snow, and is wholly barren, having neither tree nor shrub of any kind. It is unnecessary to say that it is uninhabited, there being no such people in the southern hemisphere as the Esquimaux; and it may be remarked, that no human beings are found in the Southern Ocean below the 55th

parallel of latitude, and none beyond the 50th, except on Patagonia and Tierra del Fuego. On the shores, the seals and sea-horses, which had remained from the Creation undisturbed, were so numerous, that on the first notice of the rediscovery, a whole fleet of vessels from England and North America crowded thither on speculation; but the loss of several from tempestuous weather, and a dangerous navigation, and the destruction and alarm of the objects of their cupidity, will probably cause it, for some time at least, to remain as much a land of desolation as it had been before.

For an account of Polar Sea expeditions, *see* ARCTIC OCEAN. Refer to PARRY'S *Voyages*; FRANKLIN'S *Expeditions*, etc.; *American Journal of Science*, xvi. 124; *Westminster Review*, xxxi. 273; *American Quarterly Review*, iv. 215; BLACKWOOD'S *Magazine*, ii. 368, iv. 157; *Eclectic Magazine*, xii. 43, xx. 60, xix. 414; *Edinburgh Review*, xlviii. 428, lxi. 223, lxiii. 151; *Quarterly Review*, xxviii. 372, xxxvii. 523, xxxviii. 335, lvi. 151, lxvi. 218; *North British Review*, xvi. 236, xxiv. 195, 275, 453, xxxi. 291, xxxvi. 45, 241; *Living Age*, xxv. 18, xxvi. 572, xx. 289; FRASER'S *Magazine*, xxxviii. 603; DE BOW'S *Review*, xiii. 1.

Policy of Insurance, or **Assurance**, of ships, is a contract or convention by which a person takes upon himself the risks of a sea-voyage, obliging himself to make good, in part or in whole, the losses and damages that may befall the vessel, its equipage, tackle, victualing, lading, etc., either from tempests, shipwrecks, pirates, fire, war, reprisals, in consideration of a certain sum, more or less according to the risk; which sum is paid down to the assurer by the assuree upon his signing the policy.—*See* INSURANCE.

Polynesia ("many islands") includes the multitude of islands scattered over the Pacific Ocean, and comprehends a belt chiefly within 30° on each side of the equator, and from longitude 135° E. to 135° W. Including New Zealand, the boundary extends south of the equator to lat. 47° S. The islands are distributed into numerous groups, and these groups, of an elongated form, have a general direction from northwest to southeast, and are composed of one or more larger islands, and numerous smaller ones. The principal groups to the north of the equator are the Pelew, Ladrone, or Mariane, Caroline, Radack, Marshall, Gilbert, and Sandwich Islands. South of the equator are New Ireland, New Hebrides, New Britain, Feejee, Friendly, Navigator's, Solomon's, Society, Mendana or Marquesas, Low Archipelago, Cook's, Austral, and other minor groups, besides numerous detached islands, as Easter and Pitcairn islands. With the exception of Hawaii, the largest island of Polynesia, the most considerable of the others range from 20 to 60 and 100 miles in circumference, while many do not exceed a mile or two in length. These islands are all, more or less, of coral formation; the Low Archipelago, Society Islands, Marshall, and Carolines, presenting the regular atoll form, with circular reefs and lagoons. The Friendly, New Hebrides, Solomon's, and Sandwich Islands, present fringed reefs, and have active volcanoes; summits of mountains varying from 2000 to 13,000 feet. In the lower coral islands the elevations do not exceed 500 feet. In the atoll coral islands, Darwin has supposed that a depression of surface is taking place, and that the volcanic islands are either stationary or rising. From the great predominance of ocean, the temperature of Polynesia is comparatively moderate, the climate delightful and salubrious. Mean annual temperature of Sandwich Islands 77°; temperature of Society Islands, 70° to 80°, and rarely 90°, Fahrenheit. The southeast tropical winds generally prevail, but northwest and southwest winds are not uncommon. Hurricanes are rare, and earthquakes slight and not of frequent occurrence. The refreshing coolness of the trade-winds, and a regular but not excessive supply of moisture, are favorable to a luxuriant vegetation. Soil in the valleys and in the river courses a rich volcanic mould; on the mountains less fertile. Both vegetable and animal productions are limited as to number of species. In the islands of the middle and eastern divisions not more than 500 species of plants are found. This number increases toward the west and northwest. The bread-fruit, peculiar to this region, the cocoa, banana, plantain, banyan, sugar-cane, yam, and cotton-plant, paper-mulberry, and a species of chestnut, are indigenous. Other trees and plants of tropical climates have been introduced and flourish; and arrow-root, sweet potatoes, the common potato, and maize, are now reared abundantly. There are several timber trees, especially sandal-wood, a few spices, and ornamental flowers, which, however, have little odor or decided color. The islands were all remarkably deficient in animals, thus indicating their isolated and comparatively recent origin. Turtles resort in great numbers to many localities, and fish are plentiful on the coasts. Several species of whales, the cachalot or sperm whale, Cape whale, humpback, and blackfish, are peculiar to the seas of the Pacific, and their capture has been the chief inducement for ships visiting these regions. Oxen have been introduced from New South Wales, and thrive well; and horses from South America. The natives of Polynesia are in general a well-formed, tall, active, and intelligent people. There are two distinct races, one apparently of Malay origin, by far the most numerous and intellectual, and spread over all Central and Eastern Polynesia, and speaking one common language, though varying in dialects. The other a negro or Papuan race, with negro features and color, and crisped mop-like hair, growing in separate tufts, speaking a distinct language, and exhibiting an intellect of an inferior grade, probably the first settlers of the islands, and now confined to the western part of Polynesia, and inhabiting partly or wholly New Guinea, New Britain, New Ireland, the Solomon Islands, New Caledonia, New Hebrides, and part of the Ladrone Islands. Some of the western islands, as the Ladrones, were discovered by Magelhaens in 1521, the Marquesas by Mendaña in 1595; but it was not till 1767 that Wallis, and subsequently Cook, explored and described the leading islands of this region. Soon after this, missionaries began to settle in the islands, and after many discouragements at last have succeeded in promoting Christianity and civilization in some of the principal islands; though cannibalism and savage ferocity still prevail in the majority. The population of these islands varies continually from wars, migrations, and occasional pestilence. Tahiti and some others, when first discovered, were conjectured to be greatly more populous than at present, but no proper data exist for affording even an approximation to the real numbers. Probably the population of the whole of Polynesia does not exceed one million or one million and a half. —HARPER'S *Gazetteer*.

Pomegranate (Ger. *Granatäpfel*; Fr. *Grenades*; It. *Granati*, *Melagrani*; Sp. *Granadas*), the fruit of the pomegranate-tree (*Punica granatum*). This tree, which grows to the height of 15 or 20 feet, appears to be a native of Persia, whence it has been conveyed, on the one side, to Southern Europe, and on the other to the tropical parts of Asia, and eventually to the New World. The fruit is a pulpy, many-seeded berry, the size of an orange, covered with a thick, brown, coriaceous rind. The pulp has a reddish color, and a pleasant sub-acid taste. The value of the fruit depends on the smallness of the seed and the largeness of the pulp. The finest, called by the Persians *badana*, or seedless, is imported into India from Cabul and Candahar, where the pomegranate grows in perfection. The tree thrives all the way to the equator; but within the tropics the fruit is hardly fit for use. The pomegranates brought to market from the south of Europe and the West Indies are very inferior to those of Persia.

The *Punica granatum* is a tree, in magnitude and ligneous character, bearing considerable resemblance

to the common hawthorn. In a wild state it forms a thorny bush; but when cultivated in gardens and in plantations, under favorable circumstances, it often attains a height of 15 or 20 feet.

The *Punica granatum* is indigenous to Barbary, Persia, Japan, and various parts of Asia; and has long been naturalized in the south of Europe, the West Indies, and in South America. In the Himalayas, Mr. Royle informs us that the pomegranate grows wild, and also that it is planted near villages. It forms quite a wood in Mazanderan, whence the dried seeds are exported for medical use. The famous seedless pomegranates are grown in the rich gardens lying under the snowy hills near the River Caubul. They are also described as delicious about Hadjiabad, and throughout Persia. "Though grown in most parts of India," says Mr. Royle, "large quantities, of superior quality, are yearly brought down by the northern merchants from Caubul, Cashmere, and Boodurwar." The pomegranate-tree, which partakes of the antiquity of the vine, the fig, and the olive—and which, a point of utility, is numbered with the grain-bearing plants, and with honey, all constituting the principal food of the Eastern nations, in the early stages of civilization—must possess no small degree of historical interest. It is mentioned by Theophrastus under the name of *roa*; the Phœnicians called it *sida*; the Greeks *cytinos*; and the Romans, according to Pliny, *malus punica*.

The general diffusion of the pomegranate throughout the climates suited to its growth, implies that it possesses highly valuable properties. In hot countries its utility is incontestable; for its juice is most grateful to the palate, and assuages thirst in a degree quite peculiar to it, from its pleasant acid—an acid so soft that it may, in truth, be said to be "full of melting sweetness," as Moore expresses himself. The pulp, however, which incloses the seeds, is sometimes acid, sometimes sweet; and in some cases vinous, astringent, and always refreshing. A sirup is made from the pulp by the druggists, as well as from the dried flowers, which is employed as an astringent and detergent. The rind of the fruit, on account of its astringent properties, is sometimes employed in *materia medica*, as well as in the veterinary art. It has also been used as a substitute for galls, in the manufacture of black ink, and is said to be still employed in some parts of Germany in dyeing leather red, in imitation of morocco. In the Himalayas, Mr. Royle informs us, the rind of the fruit, called *naspal*, "being very astringent, is used in medicine, as well as in dyeing. The employment by the natives of India of the bark of the root for the expulsion of the tape-worm, being now well known, since the subject was communicated by Drs. Hamilton and Fleming, is a remarkable instance of the oblivion into which even a valuable medicine may fall, as this property was well known to Dioscorides." Lord Bacon recommends the juice of pomegranates as good for liver complaints; and Dr. Woodville says it is preferable to that of oranges in cases of fever. From the flowers, with the addition of alum, there may be obtained a fine red ink. The flowers, also, were formerly used to dye cloth a light red.—BROWNE's *Trees of America*.

Ponce. *See* PORTO RICO.

Pondicherry. The name of Pondicherry is made to include all the French possessions in India, because it is the most considerable of them. It is situated on the Coromandel coast of Hindostan, in latitude 11° 57′ N. Its population in 1836 was 52,127, of whom 696 were Europeans. The French possessions in India comprise also Chandarnagore, Karikal, in the Carnatic; Mahé, in Malibar; Yanaon, in Orissa; with the territory attached to each. These have a total population of 166,000, of whom 1000 are whites. The products are rice, grain, cocoa-nuts, betel, indigo, tobacco, and cotton. The annual value of the imports is about $373,000, and of the exports about $1,200,000. The trade, nearly all being at Pondicherry, is with the Coromandel coast, Isle of Bourbon, the Mauritius, and Senegal. Pondicherry would have been a commercial point of great magnitude but for the changes of ownership, occasioned by the frequent wars of France and England. The law of the 17th May, 1826, provides that the distinction between the French and foreign factories in India shall be suppressed in the tariff, and that merchandise from any of these settlements shall pay no other duties than are imposed on the same articles brought from the French settlements.

Poplar (Ger. *Pappel*, *Pappelbaum*; Du. *Popelier*; Fr. *Peuplier*; It. *Pioppa*; Sp. *Alamo*; Lat. *Populus*). Of the poplar (*Populus* of botanists) there are about 15 species described. In most favorable situations the white poplar grows with great rapidity, sometimes sending forth shoots 16 feet long in a single season. The wood is soft, and not very durable unless kept dry; but it is light, not apt either to swell or shrink, and easily wrought. The Lombardy poplar grows rapidly, and shoots in a complete spire to a great height; its timber does not differ materially from that of the white poplar. It is very light, and is therefore well adapted for the manufacture of packing-cases. None of the species is fit for large timbers.—TREDGOLD's *Principles of Carpentry*; *Vegetable Substances*, *Library of Entertaining Knowledge*.

Population. It would be quite inconsistent with the objects and limits of this work to attempt giving in this place any explanation of the laws which regulate the progress of population. However, as it is frequently of importance in commercial questions, and in others affecting commercial interests, to be able to compare the consumption of an article with the population, we believe we shall gratify our readers by laying before them the following Table, showing the comparative population of the principal commercial countries of the world:

Countries.	Population.	
Austrian Empire, 1842..	35,730,112	
	Austria.....	23,062,561
	Hungary.....	7,864,262

For disquisitions on the law of population, see writings of MALTHUS, GODWIN, A. H. EVERETT, GRAY, SADLER, THORNTON, DOUBLEDAY. The subject of population is discussed in the following periodicals: *Westminster Review*, lii. 153, xlvii. 100, lvii. 408; *Quarterly Rev.* xlv. 97, xxvi. 148, xvii. 369, liii. 30; *Bankers' Mag.*, New York, iii. 457, 528 (J. H. ALEXANDER); *North Am. Rev.* lxvii. 370 (BOWEN), xxxiii. 1 (A. H. EVERETT), xvii. 288 (E. EVERETT), xxiv. 218 (SPARKS), xv. 989; HUNT'S *Merchants' Magazine*, vii. 241, 337, 529, viii. 240, 330 (TUCKER); *Edinburgh Review*, xvi. 464, xxxv. 362, li. 297, lii. 504, lxxxv. 85; *Monthly Review*, ciii. 80; BLACKWOOD'S *Magazine*, xxviii. 109, xxix. 392, xxi. 377; *British Quarterly Review*, iv. 115; *American Almanac*, 1837, 1818; *Democratic Review*, xxi. 397 (A. H. EVERETT), xvii. 297, 379, 408 (TUCKER), xxii, 11.

Porcelain, or China Ware, a very fine species of earthen-ware. The first specimens of this fabric were brought to Europe from China and Japan. The best Chinese porcelain is of a very fine texture, white, semi-transparent, and sometimes beautifully colored and gilt; is infusible, and not subject to break by the sudden application of heat or cold. The Chinese term for the article is *tse-ki*. But the Portuguese, by whom it was first brought in considerable quantities into Europe, bestowed on it the name of porcelain, from *porcella*, a cup. Common earthen-ware, sometimes of a very good quality, is manufactured in Canton, Fokien, and several other provinces of China. But it is a curious fact that the beautiful porcelain imported into Europe is made only in the town of Kingtesing, in the province of Kyangsi. Its manufacture is fully described by Duhalde, in his account of China, under the head "Porcelain and China-ware." The porcelain of Japan is decidedly inferior to that of China; very little is imported, and it is valued only as a curiosity. After porcelain began to be imported, its beauty soon brought it into great request, notwithstanding its high price, as an ornament for the houses and tables of the rich and the great. The emulation of European artists was in consequence excited. Very little information was, however, obtained as to the mode of manufacturing porcelain till the early part of last century, when the process was developed in a letter from a French Jesuit in China, who had found means to make himself pretty well acquainted with the subject. The knowledge that thus transpired, and the investigations of Reaumur and other chemists, prepared the way for the establishment of the manufacture in Europe. It was first commenced at Dresden, which has been famous ever since for the beauty of its productions; but the finest and most magnificent specimens of European china have been produced at Sèvres, in France, in the factory carried on at the expense of the French government.

British Porcelain Manufacture.—This, though unable to boast of such fine specimens of costly workmanship as have been produced at Sèvres and Dresden, is of much greater national importance. Instead of exclusively applying themselves to the manufacture of articles fitted only for the consumption of the rich, the artists of England have exerted themselves in preference to produce China-ware suitable for the middle classes; and have succeeded in producing articles at once excellent in quality, elegant in form, and cheap. We are principally indebted for the improvements made in this important manufacture to the genius and enterprise of the late Mr. Josiah Wedgwood. This extraordinary man owed none of his success to fortuitous circumstances. Devoting his mind to patient investigation, and sparing neither pains nor expense in accomplishing his aims, he gathered round him artists of talent from different countries, and drew upon the stores of science for aid in pursuing the objects of his praiseworthy ambition. The early and signal prosperity that attended his efforts served only as an incentive to urge him forward to new exertions, and as means for calling forth and encouraging talent in others, in a manner calculated to promote the welfare of his country. Previously to his time, the potteries of Staffordshire produced only inferior fabrics, flimsy as to their materials, and void of taste in their forms and ornaments; the best among them being only wretched imitations of the grotesque and unmeaning scenes and figures portrayed on the porcelain of China. But such have been the effects resulting from the exertions and example of this one individual, that the wares of that district are now not only brought into general use in England, to the exclusion of all foreign goods, which had been largely imported, but English pottery has since been sought for and celebrated throughout the civilized world, and adopted even in places where the art was previously practiced. An intelligent foreigner, M. Faujas de St. Fond, writing on this subject, says: "Its excellent workmanship, its solidity, the advantage which it possesses of sustaining the action of fire, its fine glaze impenetrable to acids, the beauty and convenience of its form, and the cheapness of its price, have given rise to a commerce so active and so universal, that, in traveling from Paris to Petersburg, from Amsterdam to the farthest part of Sweden, and from Dunkirk to the extremity of the south of France, one is served at every inn upon English ware. Spain, Portugal, and Italy are supplied with it; and vessels are loaded with it for both the Indies and the continent of America."—See the quotation in the *Account of the Porcelain Manufacture*, p. 16, in LARDNER'S *Cyclopædia*. For the statistical details with respect to the manufacture, see the article EARTHEN-WARE. The

British porcelain manufacture is principally carried on at the potteries in Staffordshire, and at Worcester, Derby, Colebrook Dale, and other places.

Murrhine Cups.—It was long a prevalent opinion among modern critics that the *vasa murrhina*, so famous in Roman history, were formed of porcelain. Pompey was the first who brought them to Rome from the East, about 64 years before the Christian era. They were used as drinking-cups, and fetched enormous prices; Nero having given, according to the common method of interpreting, £58,000 for a single cup! The extravagance of the purchaser may, in this instance, be supposed to have increased the price; so that the degree of estimation in which these cups were held may be more accurately inferred from the fact that, of all the rich spoils of Alexandria, Augustus was content to select one for his share.—SUETONIUS, lib. ii. c. 71. Pliny (lib. xxxvii. c. 2) says they were made in Persia, particularly in Karamania. But those who contend they were China-ware, chiefly found on the following line of Propertius:

Murrheaque in Parthis pocula COCTA FOCIS.—Lib. iv.

In despite, however, of this apparently decisive authority, Le Bland and Larcher have, in two very learned dissertations (*Mémoires de Littérat.* tom. xliii.), which Dr. Robertson has declared are quite satisfactory, endeavored to prove that the *vasa murrhina* were formed of transparent stone, dug out of the earth in some Eastern provinces, and that they were imitated in vessels of colored glass.—ROBERTSON'S *Disquisition on India*, note 39. Dr. Vincent (*Commerce and Navigation of the Ancients*, vol. ii. p. 725) inclines to the opposite opinion; but the weight of authority is evidently on the other side. At all events, it is plain that if the murrhine cups were really porcelain, it had been exceedingly scarce at Rome, as their price would otherwise have been comparatively moderate. But it is most probable that the ancients were wholly unacquainted with this article; which, indeed, was but little known in Europe till after the discovery of the route to India by the Cape of Good Hope. For some further details on this question, *see* KIPPINGII, *Antiq. Rom.* lib. iv. c. 3.—See *American Journal of Science*, xxvi. 233; *American Monthly Review*, ii. 117.

FOREIGN IMPORTATIONS AND EXPORTATIONS, DOMESTIC EXPORTS OF THE MANUFACTURES OF CHINA, PORCELAIN, EARTHEN AND STONE WARE, OF THE UNITED STATES.

Years.	Foreign Importations.	Foreign Exports.	Domestic Exports.
1840	$2,070,231	$63,754	$10,959
1841	1,536,450	51,570	6,737

Pork Trade of the West.—The *Cincinnati Price Current* contains returns of the pork trade from all the principal points in the West for the seasons of 1855-'56,

and 1856–'57. The following is a recapitulation by States of the number of hogs packed:

States.	1855–'56.	1856–'57.
Ohio	633,697	483,048
Kentucky	428,334	349,212
Indiana	482,531	316,629
Illinois	481,258	363,202
Missouri	189,904	149,244
Iowa	172,378	105,322
Tennessee	62,400	42,811
Wisconsin	39,000	15,000
Grand totals	2,489,502	1,818,468
	1,818,468	
Total deficiency, 1857.	671,034	

Port, a harbor, river, or haven, formed either by nature or art to receive and shelter shipping from the storms and waves of the open sea. Artificial ports are those which are either formed by throwing a strong mound or rampart across the harbor's mouth to some island or rock, or erecting two long barriers, which stretch from the land on each side like arms or the horns of a crescent, and nearly inclose the haven. The former of these are called *mole-heads*, and the latter *piers*.

Port is also a name given on some occasions to the larboard or left side of the ship, as in the following instances. Thus it is said, "The ship heels to port;" that is, stoops or inclines to the larboard side. "Top the yard to port," the order to make the larboard extremity of a yard higher than the other. "Port the helm," the order to put the helm over the larboard side the vessel. In all these senses this phrase appears intended to prevent any mistakes happening from the similarity of sounds in the words *starboard* and *larboard*, particularly when they relate to the helm, where a misapprehension might be attended with very dangerous consequences.

Ports, the embrasures or openings in the side of a ship of war, wherein the artillery is ranged in battery upon the decks above and below.

Port-au-Prince, the capital of Hayti, or St. Domingo, in lat. 18° 33′ 42″ N., long. 72° 27′ 11″ W. Population variously estimated, probably from 18,000 to 20,000. It is situated on the west coast of the island, at the bottom of a large and deep gulf. It was founded in 1749; since which, with few intervals, it has been the capital of French St. Domingo, as it is now of the entire island. It is partially fortified; the harbor being protected by a battery on a small island at a little distance from the shore. The country round is low and marshy; and the heat in the summer months being excessive, the climate is then exceedingly unhealthy. The buildings are principally of wood, and seldom exceed two stories in height. The entrance to the harbor is between White Island and the southern shore. The depth of water varies from about 18 feet at ebb to about 21 feet at full tide. It is customary, but not compulsory, to employ a pilot in entering the harbor. They are always on the look-out. Ships moor head and stern, at from 100 to 500 yards from shore; loading and unloading by means of boats, as there are neither docks nor quays to assist these operations. The harbor is perfectly safe, except during hurricanes, which may be expected from August to November. The commerce of Port-au-Prince is carried on by various classes of persons. The imports from Europe and America are principally consigned to European and North American commission houses, besides a few Haytien establishments. The capital is one of the ports to which foreign merchants are confined by the law of patents; but they are restricted by heavy penalties to a wholesale business with Haytiens, and to a minimum amount of goods. Of course they can not deal with the consumers, but with the native retailers, who are chiefly women, styled "merchandes;" these employ hucksters, also women, who traverse the country, attend the markets, and give an account of their transactions to their employers, either every evening, once a week, or once a month, according to their character for integrity.

This city, being the capital of the empire, centralizes the large bulk of Haytien foreign commerce. It is true that less than a third of the vessels engaged in this foreign commerce depart from its ports with full cargoes; but this is owing to the fact that it is unable to supply sufficient exports, and the laws of Hayti permit foreign vessels, after unloading at the first port, to proceed to others to make up their cargoes. The general navigation from 1846 to 1850 comprised, arrivals and departures, 1448 vessels, with an aggregate of 219,810 tons, or an annual average of 290 vessels of 43,962 tons. The flags which enter into the foreign trade of this port are, the United States, French, English, Danish, Belgian, Hamburgian, and Bremen. Notwithstanding the great efforts made by Great Britain and France in 1847 and 1848 to ameliorate the commercial and agricultural condition of Hayti, its general commerce, during the five years ending with 1850, declined at least thirty-three per cent. when compared with the preceding five years. Its European commerce, more especially, is yearly declining, while its general trade with the United States has largely increased. The number of American vessels entered and cleared during the last six months of 1854 was 122, with an average of 200 tons each. Total value of cargoes inward, $488,[illegible], consisting chiefly of provisions, lumber, and dry goods. Cargoes homeward consisted of logwood, coffee, and hemp, the value of which is omitted in the official returns. Assuming the navigation between the United States and this port to have been as active the first six months of 1855 as the last, the figures for the whole year would stand thus: Total number of American vessels entered and cleared at Port-au-Prince in 1854, 244. Official returns give as the total for 1852, 210; 185[illegible] 189; which shows an increase for each successive year.—*Commercial Relations of the United States.*

Port Aux Cayes, a sea-port of Hayti, is one of the most important of the empire. In 1850 there entered and cleared 372 vessels, measuring an aggregate of 50,574 tons. The city is generally reputed one of the most progressive in the island, and is the capital of the southern peninsula of Hayti; the best irrigated and most fertile province in the empire. Here, as in the other ports, the United States holds the first commercial rank. The chief imports from the United States are provisions, of which the consumption is heavy. During the past two or three years American merchants have also imported domestic cottons and manufactures of cotton, generally in such quantities, and with such success, as to have already disheartened all foreign competition. The French authority (*Commerce Extérieur*) says, in reference to this singular success of American merchants in this as in the other markets of Hayti: "This species of merchandise (American cottons) is in high repute for its excellent quality. It is superior to that manufactured in England, and is sold at a lower figure." France supplies a small quantity of wines, oils, and fabrics of Marseilles and Paris. Coasters plying between St. Thomas, Curaçoa, and Jamaica, import small packages of European wares, and some provisions, for which they generally find a ready market. The quantity of coffee annually exported from Aux Cayes is estimated at between four and five million pounds. During good seasons this figure rises to six million pounds. In this total, however, are included considerable quantities imported coastwise from the neighboring ports. The district proper of Aux Cayes supplies but little coffee, the principal article of culture being the sugar-cane, the produce of which, first converted into sirup, then manufactured into rum, taffa, etc., supplies the greater part of the island with spirituous liquors. Campeche-wood (logwood), the produce of which is considerable, supplies an export trade of 20,000,000 lbs.

Imports into Aux Cayes, 1850.—From the United States, $266,166; Great Britain, $246,480; France, $39,432; Hanse Towns, $29,574; other countries, $9858; total, $691,510.

Porte, the Sublime. The official title of the government of the Ottoman empire: said to be derived from a gate of the palace at Brousa, the original metropolis of that empire, called Bâb Humayoor, the sublime gate.

Porter, a liquor brewed from malt, part of which has been more highly dried than that used for ale. It is hopped in the same way as ale; and its deep color is finally given to it either by burned sugar, which usually goes under the name of *coloring*, or, more legitimately, by roasted or parched malt. Porter was first brewed in 1722. The malt liquor previously drunk consisted of three kinds—ale, beer, and "twopenny;" and a mixture of either of these kinds was a favorite beverage under the name of "half-and-half;" or a mixture was drunk called "three threads," consisting of equal portions of each of the above kinds of liquor, for a draught of which the publican had to go to three different casks. About 1722, Harwood, a London brewer, commenced brewing a malt liquor which was intended to unite the flavors of ale and beer, or ale, beer, and "twopenny;" and, having succeeded, he called his liquor "entire," or "entire butt," a name intended to intimate that it was drawn from one cask or butt only. A mixture of ale or porter, drawn from different casks, is very commonly drunk in London at the present time. Harwood's liquor obtained the name of porter from its consumption by porters and laborers. From 1722 to 1761, the retail price of porter in London was 3*d.* per pot, when it was raised to 3½*d.*, at which it continued till 1790. It has never been higher than 6*d.*

Porter's Anchor. This anchor is an English patent, and is extensively used at Southampton, and other English ports. Its peculiarity consists in giving to the arms and flukes a freedom of motion round a pivot or fulcrum at the end of the shank, thus departing at once from the rigidity usually observed in the construction of anchors. The arms and flukes are forged wholly independent of the shank, and have a hole drilled transversely through the centre for the reception of the iron bolt which connects them with the shank. The effect of this construction of a swivel anchor is, that when one fluke enters the ground the other necessarily falls down upon the shank, thereby avoiding the danger incident to the upward projection of a sharp point. The objects designed to be attained by this new construction are said to be mainly the two following: the avoidance of the consequence of what is called "fouling," by the cable passing over the exposed fluke of the anchor when the vessel is swinging in a side way; and the avoidance of injury to the vessel itself in the event of falling on her anchor.

Porters and **Porterage.** Porters are persons employed to carry messages or parcels, etc.—*See* CARMEN.

Portland, city, port of entry, and capital, Cumberland county, Maine, is situated on a peninsula at the western extremity of Casco Bay, 60 miles south-southwest of Augusta. It is 105 miles from Boston, *via* the Eastern Railroad, and 111 *via* Boston and Maine, and 294 from Montreal, *via* the Atlantic and St. Lawrence Railroad, and the Kennebec and Portland, and the Androscoggin and Kennebec, connecting it with Augusta and with Waterville. Lat. (Mount Joy), 43° 39′ 52″ N., and long. 70° 18′ 31″ W. from Greenwich, and 7° 49′ 14″ E. from Washington. Population in 1800, 3677; in 1810, 7169; in 1820, 11,581; in 1830, 12,601; in 1840, 15,318; in 1850, 20,815; and in 1854, 25,000. The peninsula projects eastwardly into the bay about three miles, and has an average width of three-fourths of a mile, forming throughout its entire length an elevated ridge, which, inland, rises into considerable hills, presenting a very beautiful appearance. There were in 1856 seven banks, with an aggregate capital of $2,000,000; an insurance office; an extensive establishment making locomotives and railroad cars, employing 175 persons; three iron founderies, three brass founderies, six machine shops, three edge-tool factories, a chain-cable factory, an extensive sperm-oil factory, two plane factories, two piano-forte factories, two tanneries, six lumber-yards, five ship-building establishments, 295 stores of various kinds, and many manufactures of small wares; ten printing-offices, issuing two daily, two tri-weekly, nine weekly, and one semi-monthly publication. Capital employed in manufactures in 1850, $761,850; value of manufactured articles, $2,153,290.

The harbor is capacious and safe, and among the best in the United States. It is protected by islands from the violence of storms, is seldom obstructed by ice, has a good entrance, and is defended by forts Preble and Scammel, the former garrisoned by United States artillery. At the eastern extremity of the city is a tower, 70 feet high, erected for the purpose of observing vessels at sea, and furnished with signals. The harbor is connected by the Cumberland and Oxford Canal, 20½ miles long, with Sebago Pond, and thence with Long Pond, etc. The Atlantic and St. Lawrence Railroad, or, as it is now called in Canada, the Grand Trunk Railroad, was commenced in 1844, and is now complete to Montreal. Through this avenue pass a large proportion of the products of the North and West for shipment to Europe and elsewhere. The foreign commerce of the city is chiefly with the West Indies and Europe. Its chief exports are lumber, ice, fish, provisions, etc. The coasting trade is principally with Boston, and during the summer a steamboat plies daily to that city. Tonnage in 1853, 104,350 tons. Portland was formerly a port of Falmouth, and 130 houses, constituting two-thirds of the village, were burned by the British in October, 1775. It was incorporated under its present name in 1786, and received a city charter in 1832. It was formerly the capital of the State of Maine.

Port Louis, or **Northwest Port**, the capital of the Mauritius, at the bottom of a triangular bay, the entrance to which is rather difficult, in lat. 20° 9′ 56″ S., long. 57° 28′ 41″ E. Every vessel approaching the harbor must hoist her flag and fire two guns; if in the night, a light must be shown, when a pilot comes on board and steers the ship to the entrance of the port. It is a very convenient port for careening and repairing, but provisions of all sorts are dear. In the hurricane months the anchorage in Port Louis is not good, and it can then only accommodate a very few vessels. The houses are low, and principally built of wood. The town and harbor are pretty strongly fortified. Almost all the foreign trade of the island is carried on here.

Porto Rico (*San Juan de*), the capital of the valuable Spanish island of the same name, on the north side of the island, on a peninsula joined to the main land by a narrow isthmus, lat. 18° 29′ 10″ N., long. 66° 7′ 2″ W. The fortifications are very strong. The town, which stands on a pretty steep declivity, is well built, clean, and contains nearly 30,000 inhabitants.

Harbor.—The harbor of Porto Rico has a striking resemblance to that of Havana, to which it is but little inferior. The entrance to it, about 300 fathoms in width, has the Moro Castle on its east side, and is defended on the west side by forts erected on two small islands. Within, the harbor expands into a capacious basin, the depth of water varying from five to six and seven fathoms. On the side opposite to the town there are extensive sand banks; but the entrance to the port, as well as the port itself, is unobstructed by any bar or shallow.

Porto Rico, *Island of*, lies in the same latitude as Jamaica. Though the smallest of the greater Antilles, it is of very considerable size. Its form is that of a parallelogram, being about 110 miles in length from

east to west, with a mean breadth of about 38, containing an area of 3750 square miles. Surface pleasantly diversified with hills and valleys; soil generally fertile. It has, however, suffered much from hurricanes; those of 1742 and 1825 having been particularly destructive. Since the breaking up of the old Spanish colonial system, the progress of Porto Rico has hardly been less rapid than that of Cuba. Her population, which in 1778 was estimated at 80,650, amounted, according to a census taken in 1836, to 357,086, of whom 188,869 were whites, and only 41,818 slaves. It is obvious from this statement that a large proportion of the free inhabitants are colored; but the law knows no distinction between the white and the colored *rotturier*; and this circumstance, as well as the whites being in the habit of freely intermixing with people of color, has prevented the growth of those prejudices and deep-rooted antipathies that prevail between the white and the black and colored population in the United States, and in the English and French islands. The population is now (1853) probably above 500,000.

Porto Rico was discovered by Columbus in 1493, at which period it is said to have had a population of 600,000 souls. In 1509 it was invaded by the Spaniards from St. Domingo, and in a few years the natives were exterminated. The island was explored and conquered by Ponce de Leon, the discoverer of Florida, while prosecuting his voyage in search of the fountain of perpetual youth. Although, during the past fifteen years, agriculture has made great progress on the island of Porto Rico, there yet remains, owing chiefly to the want of labor and good roads, a considerable portion of it uncultivated. Immense plains, which, if planted with the sugar-cane, would reward labor most bountifully, are yet lying untouched by the hand of civilization or culture, because canals are wanting, through which the water by which they are now inundated could be drawn off. The island abounds in excellent timber, but as yet it has yielded no profit to the inhabitants. There are also different kinds of the more valuable woods for cabinet-makers, such as the acajou, polysander, etc.; but they still repose undisturbed amidst the ravines of the mountains. A remedy for these evils might be found in immigration; but it has ever been the policy of the government to discourage the introduction and settlement of foreigners. The laws to that end have been particularly severe in regard to all foreigners, especially to those not professing the Roman Catholic religion. Every foreigner arriving in Porto Rico is compelled, before landing, to give some responsible resident as surety for his good behavior. After six months he must either domiciliate or leave the island. Should he select the former alternative, he must embrace the Roman Catholic faith, the only religion tolerated. An intelligent traveler, who lived for some time on the island, gives the following information relative to the laws under which foreigners could become denizens:

"Previous to the year 1828 strangers were required to produce the most undoubted evidence of being Roman Catholics, in order to become domiciled; and having satisfied the authorities on this point, they were further obliged, after five years' residence, to become naturalized. Before a stranger would be permitted to land, he must give security for good political and moral conduct; and supposing that he could gratify the requirements of the law in all these particulars, such were the jealousy and illiberality of the government, that few could be induced to remain in a country where no prospect of success appeared. In 1828, however, the leniency and more liberal policy of Don Miguel La Tone, the Captain-general, by relaxing the rigor of former requirements, contributed greatly in removing the impediments to the settlement of foreigners on the island. La Tone strictly carried out the spirit of the *Real Cedula* of 1815, having for its object the encouragement of agriculture and commerce in the Spanish colonies. Thus the *domicilio* was procured by paying a trifling sum of money, and by the applicant complying with certain formalities. A considerable immigration was the immediate effect of these measures of La Tone. Lured by the superior fertility of the soil, and the liberal policy of his administration, planters from the neighboring islands of St. Croix and St. Thomas sold their estates, and brought their capital and slaves into Porto Rico. Their example was followed by several planters from the windward British and French islands. Thus seconded by foreign enterprise and foreign capital, the island has continued to prosper in a most extraordinary degree since 1828. But notwithstanding this rapid improvement, and the continued augmentation of its staple exports, this improvement would have been greater, and the exports considerably larger, *but for the oppressive duties upon all articles of necessary consumption, and the frequent heavy exactions made by the government toward the support of the war in Spain.* These causes, by diminishing the profits of the planters, have prevented them from extending their estates. Hence the progress which has been made in the cultivation of the soil is due rather to the continued influx of new settlers with their important capital, than to the prosperity or increased industry of the old."

The slave population is almost the only producing power on the island; but this is so totally inadequate to the wants of the planters, that they are frequently obliged to procure additional help from Cuba. This, however, greatly augments their expenses, since a robust and good-working slave, who in Porto Rico may be valued at $350, can not be purchased in Cuba for less than $600. Sugar and coffee are the staple productions; while tobacco, hides, woods, cotton, fruit, and rum form also a part, though to no considerable extent, of the exports. Tobacco is cultivated entirely by free labor. The five principal commercial ports of Porto Rico are San Juan (the capital of the island), Arecibo, Mayagüez, Ponce, and Guayama.

San Juan, or *St. John*.—Although possessing a magnificent port, considered one of the best on the island, San Juan is not the first commercial place, as the products exported thence are of a very inferior quality. Of the sugar shipped from this port, as well as from the other ports of the island, the United States receive more than two-thirds of the whole. But a small quantity goes to England, and also, though rarely, to France. From the United States are imported codfish and other salt fish; salt meat, boards, lumber, hoops, staves, and butter; from England, boilers for the manufacture of sugar, machinery, small quantities of iron, and heavy supplies of earthen-ware. Spanish vessels take in cargoes at St. Thomas, and discharge at San Juan, thereby avoiding the duty applicable to all vessels from all other adjacent foreign ports, in the ports of Porto Rico. Generally speaking, the whole island of St. Thomas is but a great entrepôt of European and American manufactures destined for the markets of Cuba and Porto Rico—a fact shown by the large amount of importations from St. Thomas into both these islands. The exports from San Juan in 1853 consisted of 11,369,304 pounds of sugar; 5803 hogsheads of molasses; 376 hogsheads of rum; and 910,966 pounds of coffee. It is to be regretted that the port of San Juan, one of the best and safest of the island, should be kept in so deplorable a condition. Six or seven years ago, a vessel drawing 16 to 18 feet water could take in a full cargo at the wharf; at present, a ship of the same tonnage can receive only three-fourths of her cargo, and is compelled to leave the wharf in order to get into water deep enough to take in the balance.

Arecibo, or *Areibo*.—During the last eight years the commercial condition of this port has been highly prosperous. The imports and exports have greatly increased; splendid mansions have been erected, and several commercial houses established. The harbor,

however, is so totally unprotected that vessels are compelled to anchor in a very wide berth, and frequently, during the prevalence of north winds, are forced to retire from the shore and put out to sea. They sometimes receive cargoes under sail, without casting anchor. Accidents are, in consequence, so frequent, that seldom does a year pass without having to record the loss of one or more vessels. Imports are nearly the same as at San Juan; the exports comprise about 10,000 hogsheads of sugar, 3000 of molasses, 1000 of rum, 14,000 to 15,000 quintals of coffee, and a considerable quantity of timber for Spain, to be used in the Spanish shipyards. Arecibo also exports considerable quantities of tobacco to Germany, the United States, and Cuba, amounting in the whole to about 2,500,000 pounds.

Mayagüez, or Mayaguas.—This is the most important port on the island. It possesses large capital, and contains several costly and fine dwellings. Rapidly rebuilt after the great conflagration by which it was destroyed in 1841, Mayagüez has gained in prosperity; having been before that disaster but an inconsiderable village, it has now become the most important city on the island. The surrounding district produces large quantities of coffee, though since 1840 there has been a sensible diminution in that article. For that year the exports amounted to 80,000 quintals, while in 1853 they fell to 43,500 quintals. The coffee of Mayagüez stands in such high repute in America and Germany that purchases are frequently made in advance of the crop. Hence comes also the best sugar of the island, which is mostly imported in American bottoms into the United States. In 1853 there arrived 83 American vessels of 13,272 tons, carrying freight to the value of $223,600; and there cleared 76, of 12,680½ tons, taking cargoes worth $460,013. The molasses from this port is always of the best quality, and much sought after by American and English shippers. Besides coffee, in 1853 there were exported 165½ hogsheads of rum, 8221 hogsheads of molasses, 20,766,033 pounds of sugar, but only 4463 pounds of tobacco, showing a decrease, compared with the preceding year, of over 50,000 pounds. There were, besides, 1000 hogsheads of rum mixed with tabasco pepper (*malagueta*), a preparation constituting now a new and profitable branch of domestic industry. Imports from the United States and England are generally similar to the imports into San Juan. Within the past few years a considerable number of planters, of moderate capital, have engaged in the cultivation of cocoa with perfect success. A few quintals of it sold to Spanish merchants have found a ready appreciation at Barcelona, and the article is considered equal to the cocoa of Caraccas. It is quite probable that, in the course of a few years, cocoa will be largely exported from Mayagüez, and thus supply the deficit caused by the diminution in the exportation of coffee. In addition to the products already specified, Mayagüez exports also considerable quantities of oranges, citrons, and other fruits to the United States.

Ponce.—This port is almost as important, in a commercial point of view, as Mayagüez. In 1853 it exported even more sugar and molasses than the latter. But the long droughts frequently destroy entire crops—no rain falling, oftentimes, for five or six successive months. Notwithstanding, by dint of incessant labor, and by means of artificial irrigation, the industrious planter often succeeds in partially overcoming this drawback, and in securing a passable harvest. Like Mayagüez, Ponce possesses some few vessels, which make regular voyages to and from Spain. In 1853 the exports consisted of 27,804,269 pounds of sugar, 13,161 hogsheads of molasses, 1,876,249 pounds of coffee, 72 hogsheads of rum, and some hides. This trade employed 90 vessels from the United States, carrying 15,616 tons, and entering with cargoes of the value of $173,168; and 80 vessels of 15,208 tons, clearing with cargoes in value $684,662.

Guayama.—The drought, which affects this district even more severely than Ponce, is the chief cause of its commercial decadence. Many of the inhabitants have abandoned their establishments, and gone with their slaves to seek, in the interior of the island, a climate more congenial to the culture of the sugar-cane. The sugar of Guayama shows a fine grain and good color for refinery. In 1853 there entered the port 85 American vessels, having an aggregate of 15,471 tons, importing in value $255,153; and cleared 83, of 14,873 tons, exporting a value of $492,338. The total exports of sugar during the same year were 21,920,511 pounds; of molasses, 11,618 hogsheads; of coffee, 806,683 pounds; and of tobacco, 101,862 pounds.

Mayagüez, Ponce, and Guayama are the three places on the island which possess the greatest number of steam-engines, and machines for the manufacture of sugar. This remark applies in a special manner to Mayagüez, the climate of which is particularly favorable to the development of labor. In 1850 there were put up here ten machines of from 10 to 16 horse-power each. The exportation of rum is not in proportion to that of sugar, owing to the large consumption of that article on the island.

Among the secondary ports of the island, Aguadilla and Humacao are the most considerable. In 1853 the former exported 3,092,302 pounds of sugar, 2,438,788 pounds of coffee, 649 hogsheads of molasses, and 469,956 pounds of tobacco. The latter, in the same year, exported 4,183,233 pounds of sugar, 100,000 pounds of coffee, 1676 hogsheads of molasses, and only 11,220 pounds of tobacco, against 28,300 the preceding year. The great bulk of the coffee shipped from these two ports goes to Trieste, Genoa, and Hamburg. Germany also takes from these ports a considerable quantity of tobacco.

Fajardo and Naguaba have some trade with the French West Indies, with St. Thomas and St. Croix, consisting chiefly in an exchange of live animals and provisions for the imports from those islands. Their sugar, however, amounting annually to about 5000 hogsheads, is almost exclusively sent to the United States.

Sugar.—Previously to 1820 scarcely enough sugar was produced for the consumption of the island. According to official statements, the quantity exported from all parts of the island of Porto Rico in 1839 amounted to 69,245,783 pounds, valued at $2,423,602; while in 1853 the quantity of sugar exported amounted to 110,605,859 pounds, valued at $3,318,175, showing an increase in fourteen years of over fifty per cent. The United States alone received in 1853 74,710,336 pounds, valued at $2,244,309, or over two-thirds of the whole quantity exported.

Coffee.—The quantity exported in 1839 was 8,538,362 lbs., valued at $853,000; and in 1849, 8,615,311 lbs., valued at $516,918. In 1853 it amounted to 11,580,604 lbs., valued at $694,836. Despite this seeming increase, it is a well-known fact that the cultivation of coffee is on the decline. The Hanseatic cities receive nearly one half of the whole exportation of coffee, while the United States take but an inconsiderable quantity.

Molasses.—In 1839 there were exported 3,311,719¾ gallons, of the value of $496,759; in 1849, 4,328,135½ gallons, valued at $649,220; and in 1853, 46,630¾ hogsheads, valued at $466,307. The United States received of the quantity exported in 1853 to the value of $363,612, nearly three-fourths of the total exportation.

Cotton.—The cultivation of cotton declines yearly, and has become at this time insignificant. In 1839 there were exported 1,183,973 lbs., valued at $189,435; while in 1853 the whole amount did not exceed 280,565 lbs., valued at $28,056.

Rum.—The value of rum exported in 1839 was $16,241; and in 1853, $17,106. The exportation of this article bears no proportion to that of molasses, as rum is immoderately consumed by the common people on the island.

VALUES OF THE PRINCIPAL ARTICLES IMPORTED INTO PORTO RICO, 1848–1853.—[Made up from the "Balanzas Generales."]

* The "Balanza" gives this sum as $107,257 31, which is an error.

Previously to 1815, Porto Rico, being excluded from all direct intercourse with other countries, excepting Old Spain, was either stationary or but slowly progressive, the entire value of the exports in that year having amounted to only 65,274 dollars! But at that epoch a royal decree appeared, which exempted the trade between Spain and the Spanish colonies and Porto Rico from all duties for fifteen years; and she was then also permitted to carry on a free trade, under reasonable duties, with other countries. In consequence principally of these wise and liberal measures, but partly also of a considerable immigration of rich Spanish colonists from South America, Porto Rico has latterly made rapid progress. Great improvements have been effected in the police and internal administration, and roads have been constructed in all parts of the island. The exports of domestic produce from the U. S. for the fiscal year 1856–'57 were $1,783,429.

GENERAL COMPARATIVE STATEMENT OF THE AMOUNT AND CHARACTER OF THE COMMERCE OF PORTO RICO FROM 1848 TO 1853.—(From the "Balanzas Generales.")

Years.	IMPORTATION INTO PORTO RICO.				EXPORTATION FROM PORTO RICO.			
	National Products.	Foreign Products.		Total Imports.	For the national Trade.	For the foreign Trade.		Total Exports.

1852	1,228 095	31,077	1,259,173	1452	175,886	1252	168,766
1853	1,020,246	31,641	1,051,887	1338	151,663	1225	154,867

The tonnage of American vessels arriving in 1853 at Porto Rico amounted to 67,180, or nearly one half of the total tonnage of the island, double that of all the Spanish, and nearly triple that of all the English vessels. The ports mostly visited by American vessels were: Mayagüez, 97 vessels; Ponce, 69 vessels; Guayama, 50 vessels; and Porto Rico (San Juan), 45 vessels.

The foreign Antilles, and among them especially St. Thomas and St. Croix, have the largest amount of the imports into Porto Rico. Indeed, the former, as already observed, may be considered merely as an entrepôt for European and American manufactures, serving the Spanish merchants, from its proximity to the

Spanish West Indies, as a market for all the merchandise. It will be seen that the United States occupy the first rank as regards the amount of exports, taking more than one half of the total exportations. They receive two-thirds of all the sugar, and three-fourths of all the molasses exported; these being the principal articles entering into the export trade of Porto Rico. The exportation to the United States amounted in 1853 to $2,340,000, chiefly for sugar and molasses. Spain holds the second rank in importations into, and only the fourth as respects exportations from, Porto Rico; since the foreign Antilles import more into the island, and the United States, England, and the Hanseatic cities take more from it, than does Spain, despite all differential duties in her favor, both as respects shipping and trade.

Tonnage Duties.—Ships entering the ports of the island of Porto Rico will pay, if foreign, $1 the ton; if national, 37½ cents the ton, as per register. National vessels bringing full cargoes of coals will pay no tonnage duties, although the number of tons be less than indicated by their register; foreign vessels will, however, pay 50 cents per ton, in compliance with the royal decree of December 23, 1848. But whenever a ship, either national or foreign, brings other cargo besides coals, no matter whether the coals be equal to, or more than, the amount of her tonnage, she will pay the tonnage duty in accordance with said decree. Vessels loaded with coals only are exempted from local duties, with the single exception of the fee ($23) to the captain of the port for entering and clearing. National or foreign vessels entering the ports will pay, in addition to the duties specified, 12½ cents per ton, as per register, for the purpose of deepening the harbor. Vessels arriving in the harbor of San Juan, under whatever circumstances, or for whatever purpose, will pay 12½ cents per ton for dredging and keeping the port navigable. National vessels to or from the island of St. Thomas will pay, at whatever port, the tonnage duties applicable to the flag.

COMPARATIVE STATEMENT OF THE COMMERCE BETWEEN THE UNITED STATES AND PORTO RICO, AND OTHER SPANISH WEST INDIES (EXCEPT CUBA), EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH COUNTRY, DURING THE YEARS DESIGNATED.

American vessels entering ports in the islands of Cuba and Porto Rico in ballast are not subjected to the payment of any tonnage duty whatever; and American vessels entering the ports in the islands of Cuba and Porto Rico, with cargoes of any description of merchandise whatsoever, are exempted from any charge of tonnage duty, if such vessels export or convey therefrom cargoes of molasses taken in at said ports. Exemption, therefore, from the liability to tonnage duty of Spanish vessels coming from ports in the islands of Cuba and Porto Rico is extended to such vessels arriving in ports of the United States, either in ballast or laden with molasses taken in at any of the said ports, together with such quantity of fresh fruit, the production of said islands, as may be deemed by the collector and naval officer, under the provisions of the forty-fifth section of the act of 2d March, 1799, to be admissible as surplus stores: provided the said vessels depart from the United States in ballast, or with their cargoes of molasses, or cargoes of the staple productions of the United States.—See *Commercial Relations with the United States*; *Manual for United States Consuls*; TURNBULL'S *Cuba and Porto Rico*; HUNT'S *Merchants' Magazine*, x. 327.

Portsmouth, a sea-port of England, in the English Channel, on the western side of the island of Portsea, at the mouth of the bay called Portsmouth Harbor, lat. 50° 47′ N., long. 1° 6′ W. Portsmouth Harbor excels every other in Great Britain in depth, capaciousness, and security. At its entrance the harbor is very narrow, but soon expands into a great width. Every where the anchorage is good, the depth sufficient for ships of any size, and in extent almost sufficient to contain the whole English navy. The roadstead of Spithead, between Portsmouth and the Isle of Wight, can contain 1000 sail with security. Ship-building and other manufactures are carried on to a considerable extent. The cod and other fisheries are actively prosecuted, and Portsmouth has considerable foreign and coasting trade. The tonnage of the port in 1853 was 26,645 tons.

Portugal (*Lusitania*), a country of southwestern Europe, forming the western portion of the Iberian peninsula, and situated between lat. 36° 57′ and 42° 8′ N., and long. 6° 15′ and 9° 32′ W., bounded east and north by Spain, south and west by the Atlantic Ocean. Capital, Lisbon. Length, north to south, 368 miles; breadth, 80 to 140 miles; and there are few passable roads. Wheat, barley, oats, flax, and hemp are cultivated in the elevated tracts; rice in the lowlands; olives, oranges, lemons, citrons, figs, and almonds in the central and southern provinces; and at the southern extremity, the American aloe, the date, and other tropical plants. The cultivation of the vine is the most important branch of industry, and the produce of the vineyards watered by the upper Douro, termed *port*, is the staple export. There are extensive forests of oak in the north, chestnut in the centre, and the sea-pine, kermes, and cork in the south. The olive oil is of inferior quality. Mules and asses are the chief beasts of burden; oxen are used for draught in the provinces. Cattle and sheep are reared in considerable numbers, but the wool is not of fine quality. Goats and hogs are numerous, and fish abound in the rivers and on the coasts. Iron, marble, and salt are the chief mineral products; the mines of tin, lead, and antimony are not worked. There are numerous salt marshes on the coast, and 200 mineral springs are enumerated. The manufactures are very limited, chiefly arms and porcelain at Lisbon, woolens at Portalegre and Fundao, cotton-spinning at Thomar, jewelry and trinkets at Lisbon and Oporto, glass at Marinha-Granne, paper at Alemquer, silks at Braganza and at Campo-Grande, near Lisbon. Lisbon, the capital of Portugal, is the principal port, and is situated on the north bank of the River Tagus, the observatory of the fort being in lat. 38° 42′ 24″ N., long. 9° 5′ 50″ W. Population, about 240,000. The harbor, or rather road, of Lisbon is one

of the finest in the world, and the quays are at once convenient and beautiful. Fort St. Julian marks the northern entrance of the Tagus. It is built on a steep, projecting rock. There is a light-house in the centre, 120 feet above the level of the sea. At the mouth of the Tagus are two large banks, called the North and South Cachops. There are two channels for entering the river — the north or little, and the south or great channel. On the middle of the South Cachop, about 1½ mile from Fort St. Julian, is the Bugio fort and light-house, the latter being 66 feet in height. The least depth of water in the north channel, on the bar, is four fathoms, and in the south six. The only danger in entering the port arises from the strength of the tide, the ebb running down at the rate of seven miles an hour; and after heavy rains the difficulty of entering is considerably augmented. The trade of the country is mostly conducted by the English and other foreigners. The population and extent of Portugal are shown by the following statistics, taken in 1854:

Population	3,500,000
Extent in square miles	34,500
Communes	260

The great fountain of wealth in Portugal is in its vineyards; and yet, under the system of political economy practiced by the government of that kingdom, wine can not be either grown, made, or exported, except under heavy restrictions and imposts. Until within the past few years, there was not sufficient corn grown in the few agricultural districts for the necessities of the country; still, corn is classed among its staples, and its importation from foreign countries prohibited, unless when, from any cause, the home supplies are inadequate to meet the demands for consumption. The following official return exhibits the entire agricultural resources of Portugal for the year 1851, and, with the exception of corn, the supply of which is constantly fluctuating, may be regarded as a fair index of the average yearly agricultural wealth of this kingdom:

Articles	Quantities.	Amount.
Corn	Moios	1,139,737
Beans (pulse)	"	178 812
Rice	"	12,252
Salt	"	466,166
Walnuts, filberts, almonds, and chestnuts	"	37,640
Figs	Arobas	838,700
Carob beans	"	248,160
Oranges and lemons	Thousand	390,000
Cattle	Heads	5,782,712
Wine (Maduro a verde)	Pipes	787,809
Alto-Douro port	"	100,000
Olive oil	"	43,632
Wool	Arobas	357,589
Silk	Pounds	315,140
Honey	Arobas	59,137
Beeswax	"	25,616

The moio is equivalent to 22·39 bushels. The aroba equals 32 lbs.

In 1831 Portugal imported 553,740 alqueires (each equal to 32 lbs.) of grain; between 1846 and 1851 she exported, as appears from her official statistics, about 1,800,000 alqueires from Caminha, and about 4,000,000 alqueires from Via na; making a total of nearly 6,000,000 alqueires, or 1,000,000 alqueires per annum; or an exportation of about twice as much as she formerly imported. With this brief reference to the natural capabilities and agricultural resources of Portugal, the laws and regulations under which that kingdom conducts its foreign commerce, the character and extent of that commerce, and the description of merchandise which constitutes the leading articles of exchange, especially between Portugal and the United States, will next be considered. For a long period the commercial relations of the United States with Portugal were regulated by such acts of legislation as the Portuguese government thought proper to adopt, with no other check than the countervailing legislation of the United States. Under this system the direct trade between the two countries in national vessels, laden with the produce and manufactures of either, was allowed on terms of full reciprocity; but the indirect trade was fettered by discriminations and restrictions, and by the countervailing duties to which they gave rise, until the treaty of commerce and navigation entered into between the two countries in 1840 placed their trade on a basis of entire reciprocity. This treaty stipulates that vessels of either country arriving in the ports of the other shall be put on the footing of national vessels; that no other or higher duties shall be levied on the produce or manufactures of either country, when imported into the other, than on similar produce, etc., of other foreign countries; that the same duties shall be levied on such importations, whether in American or Portuguese vessels; that all favors granted by either party to other nations shall become common to both; and that American vessels shall pay no higher duties of export in the ports of Portugal than national vessels. This treaty is declared to be in force for six years, and further, until the end of one year after either party shall have given notice to the other to terminate the same: no such notice having been given by either party, commercial relations between the two countries are still governed by its provisions.

Under the stipulation equalizing American and Portuguese vessels with respect to direct importations, the American flag enjoyed, during a brief period after the ratification of the treaty, special advantages over the vessels of other foreign nations. This was the result of a law passed by the Cortes in 1837 (before the treaty was adopted), by which a deduction of fifteen per cent. on all duties was allowed on merchandise imported in national bottoms. This measure, although it had given a great impulse to the national shipping of Portugal, and largely augmented importations in American bottoms, was found to exercise a disastrous effect on the public treasury, diminishing the revenue from that source about $300,000 annually. It was consequently abolished; and after the 15th January, 1842, all foreign vessels were equalized, in this respect, with the national flag. Notwithstanding Portugal possesses natural advantages and resources which might enable her to rank among the most important trading countries in Europe, her commerce with foreign nations, and particularly with the United States, has dwindled down to the mere shadow of what it was in former times; nor can much hope be indulged of a speedy commercial regeneration of this kingdom so long as her present restrictive and prohibitory regulations exist, and her unsurpassed natural resources remain under their present partial and imperfect system of development. The dismemberment of Brazil from the kingdom of Portugal (1820) would seem to mark the period of the greatest decline in her commerce with the United States. This can be best illustrated by giving the official returns for the equal periods preceding and following this event, and contrasting the results.

EXPORTS FROM THE UNITED STATES TO PORTUGAL AND DEPENDENCIES, 1810–1832.

Years.	Amount.	Years.	Amount.
1810	$7,679,210	1822	$427,065
1811	11,466,150	1823	246,648
1812	9,399,570	1824	518,836
1813	10,687,928	1825	408,160
1814	591,699	1826	313,553

1818	2,858,177	1830	279,759
1819	2,263,580	1831	294,383
1820	1,325,751	1832	206,218
Total	$62,606,298	Total	$5,756,492

Showing a falling off in the total amounts, during the eleven years compared, of $18,941,806, or, in the average annual amounts, of $4,449,255. It is proper, however, to remark, that the trade with Brazil absorbed more than a moiety of the total amount of the exports from 1810 to 1820. The general trade of Portugal with

all foreign countries has also declined during the past half century, in a ratio of nearly one-third in exports and one half in imports. This will be seen from the following comparison of imports and exports, for a series of years within the above-named period:

Years.	Imports.	Exports.	Total.
1801.....	$24,171,780	$31,379,730	$55,551,510
1816.....	29,287,430	20,228,895	49,560,315
1830.....	16,194,500	13,085,000	29,279,500
1844.....	12,282,530	8,225,665	20,508,195
1848.....	13,507,210	10,679,430	24,186,640

COMMERCE IN 1852 AND 1853.

Years.	Imports.	Exports.
	Francs.	Francs.
1852.....	33,200,670	18,179,875
1853.....	36,846,560	21,902,912

The wines which, at the exportation of 1853, were valued at 6,186,680 francs, were not put in the account of the crop of 1852. The imports of wine from Madeira into the United States for the fiscal year ending June 30, 1856, were 23,649 gallons; and from Portugal, 62,533 gallons.

It thus appears that in 1848 the exports from Portugal to all nations were only about one-third, and the imports from all nations about one half of the amount of exports and imports in 1801, or half a century ago. The general movements of trade between the United States and Portugal have varied so little during the past twenty years that they may be regarded as stationary, at least so long as the existing commercial regulations remain unchanged in both countries. During the past year, however, the government of Portugal has manifested some disposition to review and modify its entire system of commercial policy; and the good effects that have already succeeded the initiatory measures to this end, already adopted, will, it is believed, encourage it to remove altogether the onerous restrictions which have so long fettered its trade with foreign nations. In 1853 the export duty on wine was materially reduced, and equalized to all nations (a discrimination having been made, before that period, between exports to Europe and America); and the effect of this first step toward a more liberal policy is evidenced in the increased exportation of that great staple in 1853 over the preceding year, to an amount exceeding three-fourths of the whole. This will be seen from the following table. The pipe is estimated at the United States custom-house at about 113½ gallons:

The subjoined statements of the commerce and navigation of Oporto during the Portuguese financial year 1854–'55, and the movements in wines and brandy the same period, are made up from returns of the United States consul at that port.

Alterations lately made in the Portuguese Tariff (1853).—Broadcloths have been reduced 12 per cent. Raw silk now pays only two-fifths of the former duty. On satins, gros-de-Naples, etc., a reduction of nearly 54 per cent. has been made. Flax has been raised to 42 cents per quintal of 128 pounds, being an advance of 200 per cent. In linens, and goods of cotton and linen, as well as woolens, no great alteration has been made. In gray cloths and white shirtings there has been a reduction of about 12 per cent. Ale pays about one-third of the old duties. Wine, which heretofore paid an import duty of about $266 per pipe, has been reduced to about one-fifth of that amount. The export duty on port has been reduced and equalized to all the world. Pianos, which formerly paid from $48 to $192 each, according to size, now pay $24 each, regardless of size. Formerly, no tea could be imported except in national vessels; the duty being, from Portuguese territories, about 1s. 9d. English (42 cents), and from other parts 4s. 3d. per pound, equal to $1 02. Now tea may be imported indirectly, in national or foreign bottoms; Portuguese vessels still enjoying the usual discriminations over foreign vessels engaged in the indirect trade. It is believed that Portugal has no treaty with any nation equalizing foreign vessels to national vessels in the indirect trade. If so, all foreign flags are equally subject, with those of the United States, to an additional duty of 20 per cent. when importing goods not the produce of the country to which they belong. The chief difficulty which foreign merchants have to encounter, in selecting a cargo for the Portuguese market, arises from the complicated and almost unintelligible terms in which the tariff of that country estimates the value of merchandise. Cottons, linens, and in many instances, even fluids, are estimated by the pound; and, owing to the great variety of specific articles under any particular genus, and the great difference in their respective prices, it were next to impossible to say, even approximately, what duty is assigned to all or any of the descriptions of merchandise which usually make up a mixed cargo. Cotton, for instance, is thus classed in the tariff of 1852: *raw*, per 101 pounds, 2½ cents (which is plain enough); *manufactured*, from 6 cents to 70 cents per pound (which is not). Should an American merchant desire to ship to Lisbon or Oporto a cargo of such American produce as would be most likely to find a ready market in exchange for the wines or fruits of Portugal, he would naturally turn to the Portuguese tariff, to ascertain the import duty on such descriptions of merchandise as he could most profitably send. The article of cotton manufactures, it has been shown, would probably afford some exercise to his skill; but let him select a cargo of tobacco. The Portuguese tariff informs him that it is admitted only when sold to government contractors; but he is left in the dark with respect to the precise duty to which it is subject. If he has a correspondent

at O, arto or Lisbon, he will inform him that the duty on tobacco is arbitrary, and depends on the terms of the particular bargain he may make with the government contractors, after his cargo shall have reached port.

This complex classification of the Portuguese tariff induced some British merchants, a few years since, to make the attempt to reduce to a fixed value the actual duties levied on some of the leading imports into Portugal from foreign countries. Below is the result of their calculations, as respects some articles of cotton manufacture. The duties, in Portuguese money, are given in *reas*, the *milrea* being equal to 1000 *reas*, or $1 12.

Articles.	Duties in Portuguese Money.	Rate per Cent.
Cotton twist, etc., under 40, per pound	50	30
Cotton bleached or dyed, under 40, per pound	80	47
Wick of candles, under 40, per pound	400	....
White cottons with glazed finish, 16 threads, etc., per pound	70	33
Cottons woven with dyed threads, up to 16, per pound	200	52
Cotton dresses, shawls, or handkerchiefs, to 16 threads, per pound	400	92
White cambrics, 21 threads or upward, per pound	100	29
Colored cambric dyed in the piece, per pound	200	56
Colored cambric in shawls, handkerchiefs, dresses, or other shapes, per pound	400	88

The duties on the different descriptions of cotton goods vary from 16 (on colored velveteens) to 96 (on striped nankeens, plain) per cent. Notwithstanding the enormous duties on cottons which the above table indicates, the manufactures of Portugal, of this description of merchandise, are confined to some coarse and very inferior description of woolens, and a few common cottons and linens. Still, while that scale of duties continues, cotton tissues can never become a profitable medium of exchange between the two countries. There is no reason, however, why the United States could not compete with Brazil in supplying the markets of Portugal with sugar, rice, rum, timber, and other articles which have been heretofore chiefly imported from that country. The rice of Carolina is far superior to Brazilian, and yet Portugal consumes annually of the latter upward of 40,000,000 pounds. Brazil supplies the Portuguese market annually with sugar to the amount of from one and a half to two millions of dollars. Both these articles can now be exported from the United States to Portugal on the same terms as from Brazil.

* Nine months to June 30, and the fiscal year from this time begins July 1.

The tonnage employed in the above trade was:

	1853.	1854.	1855.
	Tons.	Tons.	Tons.
American	8,790	4,020	12,083
Foreign	14,669	10,106	16,373
Total	23,459	14,126	28,455

The exports from the United States to Portugal consist of whale oil, whalebone, sperm candles, staves and headings, beef, pork, rice, tobacco, linseed oil, soap, nails, manufactures of iron, and sundries. The imports, as taken from the United States Treasury returns, are wool, wines, vinegar, dried fruit, salt, corks and cork-tree bark, marble, sheet and bar lead, copper, and sundries.

The exports from the United States to Portugal for the fiscal year 1856-'57 included $56,439 of unmanufactured cotton, and $121,359 of tobacco.

The tonnage of the coasting-vessels employed in the coasting-trade of Brazil varies from 40 to 420 tons each. Foreign vessels are not allowed to participate in the coasting-trade. We annex a Table showing the number and tonnage of vessels employed in the coasting-trade of Portugal in 1852.

Ports.	Number of Vessels.	Tonnage.
Oporto	358	35,518
Viana	128	8,271
Figueira	108	15,050
Aveiro	153	7,910
Caminha	15	1,412
Villa de Conde	8	101
Esposende	4	120

Foreign vessels are allowed to enter into the foreign trade, and pay the same tonnage dues as those bearing the flag of Portugal, to wit: Vessels of the United States under the treaty of 26th of August, 1840; also the vessels of the following countries under different treaties and conventions, Dutch, Danish, British, Prussian, Swedish and Norwegian, Russian, Brazilian, Belgian, Hanse Towns, French, Papal States, and Hanoverian. The indirect trade is, however, excepted. Goods not the product of the country from which the vessel sails are liable to an extra duty of 20 per cent. when brought to Portugal in foreign ships.

PORT DUES, ETC.	Rees.	Cents.
Sailing in ballast, or not fully laden, per ton	250	= 28
Laden with salt, olive oil, or wine, produce of Portugal	50	= 5 3-5
Laden with other produce of Portugal	150	= 16 4-5
In all cases when re-exporting foreign goods	250	= 28
Entering in ballast, and sailing in ballast (except in cases of distress)	250	= 28
With full cargo of grain, produce of Portugal	250	= 28
With wine, salt, or olive oil	250	= 28
With other Portuguese produce	100	= 11 1-5
Contribution to remove the bar in the port of Oporto	100	= 11 1-5

An additional tax of 15 per cent. on the amount of tonnage and bar-dues is also exacted in Oporto. Under treaty, American vessels are equalized with national vessels as to these duties. Contributions for the exchange building, five reas = one half cent, nearly. Steamers pay two-fifths less tonnage dues than sailing vessels. The contribution for the bar is the same for both. Every captain of a merchant-vessel is bound to have two manifests of the same tenor, signed by himself, and certified by the Portuguese consul or vice-consul at the port of departure. Goods omitted in his manifest, or of a different description, have to pay a sum equal to the value of the goods. Goods admissible being omitted, a fine equal to double the amount of the duties, and custom-house charges and imposts. —*United States Commercial Relations.*

Portuguese Settlements.—The Portuguese have numerous settlements in Western Africa, situated on the River Caches, the St. Domingo, and the Rio Grande. The chief settlement in Guinea is on the island of Loando; and in Benguela, that of St. Philip. There is some trade carried on between the United States and these settlements, especially at Loando. The exports from the United States to this point consist of domestic cottons, flour, and specie; imports to the United States, gum-copal, palm-oil, ivory, hides, etc. The following summary, exhibiting the general trade between the United States and Loando, during the first six months of 1854, is derived from a consular return: Number of American vessels arrived and cleared, 10, with an aggregate of 2218 tons. Value of cargoes inward, $65,000; discharged at Loando, $13,000. Value of cargoes outward, $22,000.

From a return of later date, the trade between the United States and Loando, for the last three months of 1855 appears to have been carried on by five American vessels, of some 200 tons each—three of them belonging to Salem, Massachusetts, and two to New York. Their cargoes inward, landed, consisted of dry goods, flour, rum, etc., to the value of $24,200; the total value of inward cargoes being $61,500; and their cargoes outward, of palm-oil, gum-copal, ivory, copper ore, etc., to the value of $67,100. Each of these vessels touched at Ambriz. Indeed, vessels trading to Loando usually touch at Ambriz and Ambrizette, where they have agents, to whose consignment they land part of their cargoes, and take in such produce as may be in waiting. They then touch at Loando, and leave part of their remaining cargoes; then they make for Benguela, where they usually remain from 40 to 60 days, to close their sales, and take on board gum-copal and ivory. On their homeward voyage they again touch at Ambria and Loando, at which places they complete their cargoes of gums, palm-oil, ivory, hides, and coffee.

At Ambriz there are now two American, two English, one French, and a number of Portuguese factories. Heretofore the only duty paid at this port was a small tribute to the native king, for the privilege of trading. Recent movements indicate a design on the part of the Portuguese government to establish a regular custom-house, and charge import and export duties. The claim of Portugal is predicated on its alleged title to some copper mines in the interior, which can be reached only through this port. The little kingdom of Ambriz is too weak to resist the pretensions of the Portuguese; and however novel this claim may appear to more civilized nations than the little negro kingdom of Ambriz, there is official information to the effect that, instead of free trade, United States commerce will probably hereafter encounter at this point the burdensome restrictions of Portuguese commercial legislation.

The once flourishing and vast colonies of the Portuguese were, before the year 1850, reduced to the following territories:

	Population in 1850.
ISLANDS.	
Madeira and Porto Santo	108,464
Eastern Azores	97,330
Central	69,387
Western	68,391

Q. ADAMS). On the wine country of Portugal, see FRASER's *Magazine*, xxxvi. 302.

Postage—Post-office. Postage is the duty or charge imposed on letters or parcels conveyed by post; the post-office being the establishment by which such letters or parcels are conveyed. We propose, in the present article, to divide and treat the subject under the following heads:

I. Sketch of early Postal Affairs. II. The first National Post-office. III. The British Post-office. IV. Introduction of cheap Postage. V. Postal Statistics, and Rates of Postage in other Countries. VI. History of the United States Post-office. VII. The present Condition and future Prospects of the United States Post-office.

The post-office, as it exists to-day, is essentially a modern institution. Some writers have traced the origin of the POST to a very early period in the polit-

ical history of the world. They find the origin of the word post in the Latin *positus*, as applied to the postal couriers who were placed or posted at certain intervals or stations on the route over which letters or messages were conveyed. Herodotus, Xenophon, and other ancient historians, speak of postal couriers that were employed by kings, rulers, and commanders of armies. In Persia, in the time of Cyrus, stations were kept at regular intervals along the principal highways of the country, and messages were forwarded for the government by couriers, who acted as post-riders. In the Roman empire, in the time of Julius Cæsar, and during the reign of Augustus, a similar method of communication was kept up between the central government and the principal military stations. Marco Polo tells us, and his narrative is confirmed by other travelers, that Kublai Khan, the Emperor of Tartary, had regular post establishments throughout his vast empire. This was in the 13th century. In his narrative we find the following, which is particularly interesting, as giving an account of a regular post among a comparatively barbarous people, that was quite equal to the postal establishments of many modern Christian nations: "From the city of Kanbalu there are many roads leading to the different provinces, and upon each of these, that is to say, upon every great high road, at the distance of 25 or 30 miles, accordingly as the towns happen to be situated, there are stations, with houses of accommodation for travelers, called *yamb* or post-houses." [These are *mansiones equorum;* in the Chinese language *tchan*, and in the Persian *markileh*.] "These are large and handsome buildings, having well-furnished apartments, hung with silk, and provided with every thing suitable to persons of rank. Even kings may be lodged at these stations in a becoming manner, as every article required may be obtained from the towns and strong places in the vicinity; and for some of them the court makes regular provision. At each station 400 good horses are kept in constant readiness, in order that all messengers going and coming upon the business of the Grand Khan, and all embassadors may have relays, and, leaving their jaded horses, be supplied with fresh ones. Even in mountainous districts, remote from the great roads, where there are no villages, and the towns are far distant from each other, his majesty has equally caused buildings of the same kind to be erected, furnished with every thing necessary, and provided with the usual establishment of horses. He sends people to dwell upon the spot, in order to cultivate the land, and attend to the service of the post; by which means large villages are formed. In consequence of these regulations, embassadors to the court and royal messengers go and return through every province and kingdom of the empire with the greatest convenience and facility."

This is a picture of a very complete postal establishment. The Incas of Peru, in the 16th century, had a similar system of postal couriers to keep up communication between different parts of the country. There was a system of postal communication in France as early as the time of Charlemagne, and used principally for the conveyance of government dispatches. Louis XI. also employed postal couriers. "A permanent establishment of messengers for the conveyance of letters was attached to the University of Paris from the beginning of the 13th century, and indeed was not abolished until the year 1719, long after a general post had been settled in France. Other universities were similarly provided. Sometimes powerful or opulent individuals established posts for mercantile purposes, and the convenience of a particular district."—*Encyclopædia Britannica.* The date of the first regular post establishment in modern time was not far from the year 1497. There is a general coincidence in point of time of a number of leading discoveries, conquests, inventions, and improvements. Printing was invented in 1441. Constantinople was taken by the Ottomans, the Greeks driven from the East, and the Turkish empire founded in 1453. Postal couriers were employed in Great Britain as early as 1464. Printing was introduced into England in 1474. The kingdom of Spain was established by the union of Aragon and Castile, in 1479. The Cape of Good Hope was discovered in 1486, and America in 1492. The post-office was established in Germany about the year 1497. Africa was circumnavigated in 1498. The Reformation commenced in 1517. A system of punctuation by marks and pauses was introduced in 1520. Hungary was united to Austria in 1521. Magellan completed the first circumnavigation of the globe in 1522. The astronomical system of Copernicus was proclaimed in 1532. In India, as early as 1570, a system of foot-posts was established by Akbar, the head of the Mogul empire. Indian runners, noted for their speed, were employed, and one messenger, without relief, we are told, would often travel from 80 to 90 miles in a day.

II. *The first National Post-office.*—The first regular post-office was established by Maximilian, emperor of Germany, near the close of the 15th century—about the year 1497. At the head of this post establishment the emperor placed Francis, prince of Thurn and Taxis, the first postmaster-general mentioned in history. This establishment, originally started like all other government posts as a general errand-boy and message-bearer of government, soon became a powerful monopoly, and claimed the sole right of transmitting the correspondence of the people. From the time of its foundation to the present day the German post establishment has been held as a hereditary fief or property by the princes of the house of Thurn and Taxis. It has been a subject of frequent discussion whether postal business should be entirely carried on by government. There are arguments on both sides, and many against it can be found in the history of this German postal union. The Catholic religion being the religion of the state, Protestants made frequent and just complaints against the suppression and violation of correspondence in the cause of political tyranny and religious intolerance. We are informed that this was one of the direct causes of the Thirty Years' War. Lamoral, prince of Thurn and Taxis, a military leader (Catholic) as well as postmaster-general, by the assistance of his allies defeated and dispersed the Protestant Union under Frederick, the Elector Palatine. This was followed by the "Massacre of Prague," the "horrible persecution of all malcontents," the "banishment of thirty thousand Protestant families, and the total suppression of the Protestant religion." In this work the post-office was used as a machine for annoyance, espionage, persecution and warlike conquest. The very same postal concern is this day a stumbling-block and a serious impediment in the way of cheap postage between nations on the west—France, Great Britain and the United States—and people living in the eastern part of Europe. But the house of Thurn and Taxis own the post, pocket large profits, are deaf to all considerations of public good, and insist on the very highest paying (transit) rates of postage.

III. *The British Post-office.*—The Post-office of Great Britain, at once the most efficient, economical, and profitable of modern times, has a most interesting history. We find mention of postal couriers employed by government as early as the reign of King John. He summoned his barons to form the Parliament by issuing "letters patent." During this reign state accounts exhibit frequent items of charge for the carriage of letters. In the time of Edward II., there were fixed *posts* or stations where horses were kept for post-riders. In 1481, Edward IV., during his wars with Scotland, established, as stated by Gale, certain posts, twenty miles apart, where the riders relieved one another, and in this way conveyed letters one hundred miles a day. Long before there was any account of a national post-office, we meet with the superscription of letters,

"haste, poste haste." In 1581, during the reign of Elizabeth, Camden states that Thomas Randolph was chief postmaster of England, but nothing is mentioned as to his functions as a transmitter of letters.

Among the early records of postal affairs in Great Britain are various accounts of the violation of letters, particularly in the reign of Henry VIII. The English ambassador at the Court of James V., King of Scotland (Sir Ralph Sadler), gives numerous instances of the violation of letters by Cardinal Beaton. One messenger, a soldier from Berwick-on-Tweed, was employed to relieve the courier from the south on his way to Edinburgh, with dispatches for the embassador. He was called "the post." While on the way, he fell into the hands of Beaton's emissaries, and they seized the letters that were addressed to Sir Ralph Sadler, and refused to give them up. They were finally delivered, after they had been kept some days, and opened; "which," as Sir Ralph says, "being in cipher, they had kept the longer to prove their cunning in the deciphering of them, which (as I credibly am informed) they could do." A letter from the Earl of Angus, "Sir George Douglas hath to convey by post, and will, as he hath written to me, ride himself therewith to Berwick, because he dare trust no other man to carry it." He adds, "it is much ado to convey letters safely in this country." One messenger of King Henry was taken by the cardinal's party, who "threatened to hang him with all his letters about his neck." But on two notable occasions the wily cardinal—the Pope's *legatus à latere* in Scotland—had the tables turned upon him. One of his own couriers was shipwrecked and cast ashore near Bamborough Castle, was captured, and by the cardinal's letters found on him, it appeared that he ("through the authority of the Bishop of Rome") (the Pope) intended to get all power, spiritual and temporal, from the King of Scotland, while professing to be his friend. King Henry reported this to King James through his embassador. When he heard it, the incensed monarch said, "whatsoever he be in Scotland that we may know, doth not his duty both in the execution of God's laws above all, and also in the ministration of indifferent justice to our leges; by God," quoth he, "if we may know him, we shall not lett to punish him, be he spiritual or temporal."

The last notable act of this kind was when Cardinal Beaton sent Norman Leslie, son of the Earl of Rothes, and others, to Edinburgh, from his strong-hold at St. Andrews. Suspecting foul play, they "fingered the packet," and found they were the bearers of their own death-warrants. They returned by night, and at a very early hour in the morning, while the draw-bridge of the castle was lowered, rushed in and stabbed the cardinal in his own room. The journals and correspondence of this period contain various other instances of the violation of correspondence. The earliest mention of a postmaster, who had the charge of correspondence, and whose duties and privileges were defined, was in the reign of James I. of England. He was charged with "the sole taking up, sending and conveying of all packets and letters into foreign parts." The office was filled by Mathew le Questor, and by Mathew le Quester, his son. In 1635 King Charles issued a proclamation "for settling of the letter-office of England and Scotland." "This," says an English writer, "may properly be regarded as the origin of the British Post-office." By royal command, Thomas Witherings, Esq., was Postmaster-general. Posts were established from London to the Continent, and to Scotland and Ireland. In 1644 the Parliament made Edmund Pridcaux Postmaster-general, and he established a weekly mail. Cromwell made important improvements. He had an act passed "to settle the postage of England, Scotland, and Ireland." By this it was enacted that "there shall be one General Post-office, and one officer styled the Postmaster-general of England, and the comptroller of the Post-office." This officer was to have the "horsing" of all persons "riding in post." The rates of postage were fixed, and all other persons forbidden to "set up or imploy any foot-posts, horse-posts, or pacquet-boats." The postage of a letter eighty miles from London was two pence sterling; above that distance, in England, three pence; to Scotland, four pence; and to Ireland, six pence. Double letters were double these rates. The post-riders were required to ride seven miles an hour in summer and five in winter. Cromwell farmed the post-office out for £10,000 a year; and on the restoration of Charles II., in 1660, the office was rented for £21,500 a year. In 1663 the entire profits were settled on the king's brother, the Duke of York (afterward King James II.), and his heirs male. In 1685, by an order in council, a post-office was established on this continent "for the better correspondence between the colonies of America."

During the reign of James II., William Dockwra set up a local system of letter and parcel distribution in London. He was allowed to continue it for several years, until it proved profitable, and then his local letter system was seized under pretense that it encroached upon the royal prerogative. In the more modern history of the post-office there are parallel cases. In 1688 an act was passed for the establishment of a General Post-office in Scotland. In 1698 King William made a grant of the whole revennes of this office to Sir Robert Sinclair, with a subsidy besides of £300 a year. Even at this rate Sir Robert found it a losing business, and threw it up. In 1710 (9 Anne, ch. 10) an act was passed that may be considered the charter of the British Post-office. This act established a General Post-office throughout Great Britain and Ireland, the North American colonies, and the West Indies. It was all put under the control of one officer, styled her Majesty's Postmaster-general. The act provided for one chief letter-office in Edinburgh, one in Dublin, one in New York, and others in the West Indies. For a considerable period after the act of 1710, there were no relays of post-horses, one man or boy, and a horse, accomplishing an entire journey like the one from Aberdeen to Edinburgh, traveling by day and stopping at night. Up to 1768 there was only a tri-weekly mail from London to Edinburgh. That year the trips were increased to five times a week. The time required for the mail-coach to go between the two cities was from eighty-two to eighty-five hours. Until 1788, there was no direct mail from London to Glasgow. It is instructive to note the progress in the income of the British post-office for a period of two hundred years. The net and gross income of the British post-office at different periods will be seen in the following table, the last column giving the gross income in United States currency, reckoning five dollars to the pound sterling:

Years.	Net Revenue.	Gross Receipts.	Gross Receipts.
1653.....	£10,000	....	....
1663.....	21,500	....	....
1685.....	65,000	....	....
1096.....	67,922	£90,440	$452,200

The first year of penny postage was in 1840.

To give the different rates of postage that have been levied at various periods since the act of Queen Anne would require a long tabular statement. In 1710 the charge for a single letter from London to Edinburgh,

and from London to Dublin, was sixpence. In England the rates were three, or four pence, according to distance; in Scotland, two, three, or four pence, and in Ireland two or four pence. The rates were altered, and generally increased in amount and also in number, in each of the three kingdoms—and without uniformity in either two—in 1765, 1784, 1797, 1801, 1805, and 1812, and in Ireland in 1813 and 1814. From two or three rates in 1710, they went on increasing in number until they reached the climax of absurdity and inconvenience in twelve different rates in England and Scotland, in 1812, and thirteen rates in Ireland, in 1814. In Scotland, in 1813, an additional half-penny was levied on all letters that were conveyed in mail-coaches. These absurd, complicated, troublesome, and multifarious rates of postage remained on the statute books until they were blown from existence by the reduction of all rates to one uniform charge of a penny, through the exertions of Mr. Rowland Hill, in 1840.

The next great improvement in the mail service of Great Britain was the introduction of mail coaches, in 1784. This was principally accomplished by the exertions of Mr. John Palmer. Like most new improvements, it was the project of an outsider, Mr. Palmer not being an officer of the post-office, but the manager of a provincial theatre. That extraordinary fatality usual in such cases took possession of nearly all prominent officials; and the Postmaster-general, members of Parliament, and other dignitaries, denounced the scheme as preposterous, undignified, and impracticable. The projector was pronounced a visionary zealot, and as unreliable as a madman. It appeared to Mr. Palmer that when passenger coaches traveled regularly over the principal roads at a much more rapid rate than the horse-posts usually did, the mails could, with advantage, be transported by them. At this day we can scarcely see tangible grounds for a violent opposition to a plan to adopt the swiftest and most reliable conveyance for the mails, except in that official jealousy, which never bears a rival near the throne, or that resents the assumption of an outsider in presuming to know any thing better than the servant of routine who is paid to carry on a concern that he feels no interest in improving. The mails were transferred to stage-coaches, all the opponents of the plan were put to shame, and Mr. John Palmer received from the Treasury the sum of £50,000, and an annuity of £3000 a year for life, for the benefits he had conferred on the nation in augmenting the national income, and increasing the facilities for correspondence.

IV. *Introduction of Cheap Postage.*—Mr. Rowland Hill, an English country gentleman, in no way connected with the government or the Post-office, set to work, in 1836, to devise a plan to effect some permanent improvements in the regulation and management of the postal establishment. He found, by referring to the official records of the Post-office Department, that while the population, the business of the country, and all branches of the national income (the post excepted) had greatly increased during the preceding twenty years, the revenue and business of the post-office had with some fluctuations, actually decreased. He compared the postal income to the revenue derived from stage-coaches, a branch of business that afforded a good index to the prosperity of the country. The following table exhibits at one view a comparison of the revenue from stage-coaches, with the net postal income; and a column showing what the net revenue of the post-office would have been in 1835 had the receipts kept pace with the revenue from coaches:

Years.	Revenue from Stage-coaches.	Increase per Cent.	Net Post-office Revenue.	Revenue which would have been.	Comparative Loss.
1815	£217,671	..	£1,557,291	£1,557,291	....
1820	273,477	25	1,519,547	1,946,000	£460,453
1825	362,631	66	1,070,219	2,585,000	914,781
1830	418,536	92	1,017,952	2,490,000	1,472,048
1835	498,407	128	1,540,300	3,550,000	2,009,700

Believing that the legitimate demand for the conveyance of letters and distribution of correspondence had increased as fast as that for the conveyance of persons and parcels, it was evident that, in effect, there was a loss in post-office revenue, amounting to £2,000,000. These facts and others were first submitted privately to the government, and in 1837 to the public, in a pamphlet, entitled "Post-office Reform, its Importance and Practicability." It was received with great favor, and in a short time passed through three editions. The author came to the following conclusions: He demonstrated clearly that the actual cost of conveying a letter by coach in the mail from London to Edinburgh—400 miles—was only one-thirty-sixth part of a penny. It must be evident that the actual difference of expense between transporting a letter one mile and delivering it, and carrying one four hundred miles to be delivered, did not justify a different rate of charge. He came to the conclusion that the large cost of distributing letters was the result of complex arrangements in the post-office, arising from many rates of postage. That these complex arrangements would be avoided if postage were charged, without regard to distance, at a UNIFORM rate. That all letters should be charged by weight, those reckoned as single letters that did not exceed half an ounce each. That the uniform charge for letters, including their delivery, should be one penny. That this rate of charge would afford the greatest facilities to the public, put a stop to correspondence through private channels, and eventually prove the most profitable to the government. That with the simplicity and economy of arrangement attending the uniform charge of a penny, there would be but little more expense attending a four-fold increase of correspondence than there was with the then numerous rates of postage. That the effect of a uniform penny rate would be to increase correspondence "in all probability at least five-and-a-quarter fold." [In 1856 the number of letters in the kingdom (478,893,808) had increased more than six-fold beyond the number in 1839 (then 75,907,572), the last year of the old rates.] That the necessary cost of primary distribution, instead of being 84 hundredths of a penny, as it was under the numerous rates of postage, would only be 32 hundredths of a penny, the difference, 52 hundredths of a penny, arising from the expensiveness of the arrangements, the excessive charges, and the consequent restriction of correspondence. That the secondary distribution of letters (the delivery) ought to be untaxed, so as not in any degree to interfere with the simplicity of arrangements attending a uniform and low rate.

A verification of Mr. Hill's predictions, almost amounting to prophecy, has been established by the working of the system. In his pamphlet, published in 1837, he predicted that the increase of correspondence, and the attendant economy of management that would result from a uniform rate of a penny, "would afford a probable net revenue"—that is, in a reasonable time—"of £1,278,000." In 1856 the net revenue was exactly £1,208,725. One statement will show the great economy of management under a uniform rate of postage. Taking the cost of carrying on the British postal establishment (transportation excepted) in 1857, before there was uniform postage, and in 1854 (with the uniform charge of a penny), and looking also at the number of letters at each period, we can see what the handling, sorting, distribution, and delivery amounts to per hundred or per thousand letters. The following is the official record:

Years.	Expense of Distribution.	Number of Letters.	Expense of each 1000 Letters.
1839.....	$2,528,852	82,470,696*	$30
1854.....	3,233,195	443,649,301	7

* This number included both franked and paid letters. Omitting free letters, the number was 75,907,572.

By the efforts of Mr. Wallace, M. P. for Greenock, Lord Ashburton, and others, a parliamentary commit-

tee was appointed; and after numerous sittings, and the examination of nearly a hundred witnesses from all classes and ranks of society, they made their report in two formidable blue-books, giving the entire testimony, and a great mass of official statistical information. It is a fact worth mentioning in this place that all great postal improvements, both in Great Britain and the United States, were commenced, carried on, and prosecuted to a successful termination, by citizens entirely unconnected with the postal establishment. So far from deriving aid from those who would be supposed to possess the ability and disposition to afford it —viz., those in the post-office—they have uniformly opposed all reforms. It was singularly true in the present inquiry. "It was found, by the commission, to be a matter of the greatest difficulty to extract from the post-office any information necessary for the elucidation of the inquiry." "Not only has the post-office been utterly barren of improvement itself, but its weight is thrown into the opposite scale." "Whenever the post-office attempted to give facts and estimates to combat Mr. Hill"—to quote from an eminent writer—"it was found that Mr. Hill was always right, and the post-office always wrong." A Chancellor of the Exchequer described the "gentlemen of the post-office" as "unwilling horses." Petitions to the number of 320, from 262 different places, and bearing over 38,000 names, were sent to Parliament, asking for the adoption of Mr. Hill's plan. In 1839 franking was abolished, and an act passed authorizing the lords of the Treasury to adopt a uniform rate of one penny on all single letters, without regard to distance. The penny postage went into operation on the 5th day of January, 1840.

The official reports of the Post-office, showing the revenue and expenditure, and the amount of correspondence, comprise the best eulogy of the principle of the uniform penny rate. It is no disparagement to Mr. Rowland Hill to say that, while he was once in favor of prepayment of postage being compulsory, he has long since receded from that idea. Prepayment is not, and never has been, compulsory in Great Britain, all letters being forwarded to the persons addressed, whether prepaid or not, with the exception of letters weighing over four ounces; and these, if not prepaid, are at once opened and returned to the writer. Letters not prepaid are charged double; and such letters, if refused or not delivered, are returned to the writer from the Returned-letter office, and the double postage then due may be collected by compulsory process. By this means the distribution of circulars and advertising sheets through the mails, without prepayment, is effectually prevented. In Great Britain it is customary to refuse all unpaid matter unless a name or the handwriting on the outside shows who the sender is; and so near universal is prepayment of all postage, that more than 98½ per cent. of all letters have their postage paid before mailing.

In Great Britain there is no Dead-letter office, and there are no "dead" letters. There is a "Returned-letter office," and all letters, and even papers and printed packages, that have not, for any reason, been delivered are at once opened or examined, and, where possible, returned to the senders. When the name is printed or written on the outside of the letter, or impressed in the seal, or where a coat of arms or device reveals the writer, the letter or package is returned unopened. As there is a letter delivery by carriers daily, or several times a day, at almost every post-office and post village, refused, misdirected, or other "stray" letters are at once known, and, by the above regulations, almost all letters that in other countries (and particularly in the United States) would be pronounced "dead," and condemned to a hopeless imprisonment for months, and then, perhaps, to be burned, are here sent back to the writers and rightful owners, and usually in less than a week from the day they are mailed. The practice now is to dispatch every letter on the day it is received at the Returned-letter office. The last annual report (1857) says: "By recent arrangements, returned letters are sent back to the writers much more quickly than formerly; every such letter (except from abroad) being now opened [where necessary], redirected and reposted on the day of its arrival at the Returned-letter office. The number of letters returned to the writers last year (1856), owing to failure in the attempts to deliver them, was nearly the same as in the previous year—viz., about 2,400,000, or about 1 in 200 of the whole number of letters posted. Owing to the same cause, about 550,000 newspapers, also, were undelivered, being about 1 in 129 of the whole number."

In the case of letters that can not be delivered, even though by the fault of the writers, the British post-office is supposed to be just as much the servant of the people as in the case of letters when originally mailed and correctly addressed, and every such letter is looked upon as a piece of property, to be sent to the person addressed, when possible, and when not, returned to the owner. All letters and packages that are prepaid, when returned, are delivered to the senders without any charge; and when not prepaid, double postage is exacted. With such system, simplicity, and facility is the returning of letters carried on, that each clerk returns two hundred per day.

The principle and operation of the British Penny-postage system is this: A minimum rate of postage is sought for that shall not be an exorbitant charge for the smallest packages the shortest distances, and this postage is paid by a stamp. Now the object is to make this stamp cover as large a number and variety of packages—written and printed—as possible. Each letter is called a "single" letter that does not exceed half an ounce in weight, and each package of printed matter—newspapers, circulars, hand-bills, pamphlets, or books—done up open at the ends or sides, is considered "single" up to four ounces. Here is the value, convenience, simplicity, and utility of UNIFORM postage, both to the public at large, and to those who handle, sort, rate, and attend to the letters and mails. Drop-letters, or more properly local letters—for they are not permitted to "drop" and become "dead"—and all local mail matter, is charged at the same rate as those that are transported five hundred miles. The consequence is readily seen. The penny stamp covers almost all—more than nineteen-twentieths—the packages that are mailed. A letter not weighing over half an ounce, local or otherwise, a newspaper, pamphlet, or other printed package, not weighing over a quarter of a pound, have the postage prepaid by the all-powerful, all-convenient, universal, uniform penny stamp. Then in larger packages the rates are not cut up so fine as to be inconvenient to either the citizen or the postmaster. Letters from half an ounce to an ounce are two postages, and after the first ounce each ounce or fraction of an ounce in excess is reckoned as two postages. In printed matter, after the first half pound, the reckoning is made by half pounds; each half pound, or fraction of a half pound, being charged two postages —two pence. All the items in this simplicity and uniformity of arrangement save a vast amount of time and trouble to the people, and the clerks and postmasters, in a nation that writes and sends by mail annually nearly six hundred million letters and printed packages, particularly as each letter and printed package has to go through from four to eight different processes or operations in the hands of the citizen, and from fifteen to twenty after it gets into the post-office. Would any other system but one that combines so much wisdom, economy, convenience, simplicity, uniformity, and utility, bring nearly six hundred million letters and packages through the post-office in a single year? A record of the business, and the revenues and correspondence of the post-office of the kingdom for a few years, will do something toward answering the question.

STATISTICS OF THE BRITISH POST-OFFICE.—[*Reduced to United States Currency.*]

REVENUE, EXPENSES, NUMBER OF LETTERS, AND NUMBER AND AMOUNT OF MONEY ORDERS IN THE UNITED KINGDOM, DURING A SERIES OF YEARS, COMMENCING WITH 1815, AND ENDING WITH 1856.

Years.	Gross Receipts.	Expenses.	Net Revenue.	Number of Letters.	Number of Money Orders.	Amount of Money Orders.

1856	14,389,770	8,301,145	6,058,625	478,393,803	6,178,982	59,027,810

The money columns give the amounts in United States currency, calculating five dollars to the pound sterling. It will be seen that the gross and net revenue of the post-office for twenty years, from 1815 to 1835, actually declined. Then there were twelve or fourteen rates of postage for letters, averaging about six and a half pence sterling (13 cents) a letter. With a reduction to the uniform rate of a penny—less than one-sixth of the former rates—the postal revenue more than recovered in eleven years, while the number of letters sent by mail annually increased from 75,907,572 in 1839, to 478,393,803 in 1856. The remittances of money, in money orders, increased from a million and a half in 1839, to fifty-nine millions in 1856. To make a direct comparison between the use of the post-office in Great Britain and in the United States, it may be stated that, after a careful estimate, the number of letters sent through the post-office in this country since 1789, to 1856, inclusive—a period of sixty-seven years—has been 1,652,104,648, while in Great Britain, in the years 1853, 1854, 1855, and 1856, the number of letters was 1,789,076,769; or more in that country in four years, with low and uniform postage, than in this country since the formation of the government, now nearly three-quarters of a century! During ten years—from 1847 to 1856, inclusive—the population of London alone sent by post 920,527,039 letters, or more than in the entire United States during the same period; the latter numbering 888,527,549! But in Great Britain there was one uniform rate for letters, and one uniform scale by weight for printed matter, while in this country there are three rates of postage on letters, and on printed matter, from a small newspaper to a large book, the number of rates is almost one thousand! Under the post-office system of Great Britain there is a free-letter delivery, a safe way of remitting money by money orders, that is used to the extent of about sixty millions a year, and one low rate of postage that brings an annual income of over fourteen millions of dollars. In the United States the postage is higher; there is no uniformity, no letter delivery, and no money order system, and our population scarcely pay seven millions in postage. The people of Great Britain can scarcely one half of them read or write, and yet they write and send by mail almost 500,000,000 letters in a year.

The population of the United States, numbering just about the same as Great Britain, and nearly all able to read and write, only write and send by mail 131,000,000 letters in a year. Are further facts and illustrations necessary to show the superiority of the British postal system, or the relative merits of the "uniform postage" and the "complex postage" systems?

The correspondence between Great Britain and several of her colonies, and foreign countries, for the year 1856, will be seen in the following table:

ESTIMATED NUMBER OF LETTERS, NEWSPAPERS, AND BOOKS BETWEEN GREAT BRITAIN AND CERTAIN COLONIES AND FOREIGN COUNTRIES.

The rate of letter-postage between Great Britain and each of her colonies—over forty in number—is sixpence sterling, except to the Cape of Good Hope, Natal, Labuan, Gambia, Island of Ascension, Falkland Islands, and Vancouver's Island. A book-post, for the transmission of every species of printed matter, has also been established with the most of the colonies. The above table exhibits at one view the population, annual postal revenue, local post expenses—for rent of post-offices, salaries, etc., not transportation—amount of money remitted by money orders in a year, together with (second column of figures) the number of clerks, postmasters, sub-postmasters, and letter-receivers, and (third column) the number of town and rural letter-carriers in (and around) twenty-five of the leading cities and towns of Great Britain. The population is from the census of 1851, the local expenses and number of persons employed, for the year 1854, the money orders for 1856, and the postal revenue for both 1855 and 1856.

The British money order system is one of the most important adjuncts to the Post-office. This was first started as a private enterprise by certain officers of the post-office, in the year 1792. The commission charged was eight-pence to the pound sterling, making the whole business complicated and expensive. The consequence was, it afforded little profit to the projectors, and but very trifling accommodation to the public. The three officers engaged in it received less than two hundred pounds sterling each, ir annual profits, the entire commissions amounting in a year to less than four thousand pounds. August 13th, 1838, the money-order office was attached to the post-office, and the officers compensated for their rights. At first the commissions were put at six-pence sterling for all orders less than two pounds, and one and six-pence for orders between two and five pounds. These commissions were reduced on the 20th of November, 1840, to six-pence and three-pence respectively. No order is granted for more than five pounds. The number of persons employed in the money-order office at first was three. This was in 1838. In 1841 there were thirty-seven, and now in the money-order office in London alone there are nearly two hundred. We have seen in a table on a previous page [1558] the vast increase in the money-order business in the kingdom. In 1839 the number of orders was less than two hundred thousand, and the amount of money emitted about $1,570,000. In 1856 the number of orders had increased to over six millions in number, and the amount in a year to about sixty million dollars. The money order is a draft from one postmaster on another, and is paid at sight, in specie, to the person in whose favor it is drawn. It is as safe as a duplicate bank check before it is endorsed, and if proper care is used in remitting it; if it gets lost or stolen, it will be impossible for any but the rightful owner to obtain the money on it, even by committing forgery, as a casual finder

will not know the name of the person in whose favor it is drawn. It is safe to say that not one money order in five hundred thousand gets appropriated by the wrong person. All post-offices are not money-order offices.

There are in the United Kingdom 10,866 post-offices. Of these 845 are head post-offices, and 10,021 sub-post-offices. The number of post-offices where money orders are bought and sold is 2095. The net profit on money orders during several years was as follows: In 1849, £822; in 1851, £7437; in 1854, £16,167; and in 1856, £22,674. The commissions averaged less than one per cent.

One vast superiority of the British Post-office consists in the facilities for rapid delivery and local distribution in cities and towns. The postage on each local letter being one penny, the same as for letters the longest distance, there is a very large profit on the local distribution of letters, admitting that the carriers deliver every thing "free" that comes from other places. The clear profits on the local distribution of letters in London alone, after deducting the entire expense of letter-carriers, receivers, and mail-men, is over $900,000 a year. It will then be seen that the term "free-letter delivery" is a misnomer. By the figures in a table on a previous page it will be seen that the number of local letters in London annually is over forty-seven millions. The machinery for the local distribution of letters in London consists of about 1400 letter-carriers, one or two score of mail-men, with horse and cart, and about 500 sub-postmasters and letter-receivers. In all the densely populated parts of London there are hourly deliveries through the day, and more than four-fifths of the first morning delivery is accomplished between the hours of seven and a quarter past nine. More than one half is done before nine o'clock. In addition to the "receiving-houses," where stamps can be purchased and letters can be posted at all hours of night and day, there are now in use a large number of "letter-pillars" of cast iron. These convenient receptacles of letters have given great satisfaction, and are rapidly coming into use in cities, towns, and country districts. There is but one assignable cause for the extensive use, large income, and great profit, of the British Post-office. The charges are simple, uniform, and low; the accommodations numerous, and the deliveries rapid and punctual. The estimated number of book packages that passed through the British Post-office in 1856 was 3,000,000, the newspapers 71,000,000, and the letters 478,893,803, being a total number of 552,893,803 packages. This is probably one half of the entire number sent by mail in the civilized world.

The *personnel* of the Post-office of the United Kingdom is as follows:

Postmaster-general, Duke of Argyle	1
Secretary of the Post-office, Rowland Hill, Esq.	1
Assistant secretaries	2
Secretaries for Scotland and Ireland	2
Surveyors	15
Heads of Departments, etc.	19
Mail guards	204
Clerks	1,573
Letter-carriers and messengers	10,427
Postmasters and receivers	10,866
Total	23,130

The expenses of the British Post-office for 1856 were as follows:

Salaries, wages, etc.	£903,004
Hereditary pensions	29,310
Buildings	33,330
Mail conveyance by railway	376,363
Conveyance by coaches, etc.	162,837
Conveyance by water	14,300
Manufacture of postage stamps	26,164
Miscellaneous	108,822
Total	£1,660,229

It is an invariable rule in the British Post-office that all persons appointed shall be of a suitable age, and shall submit to a rigid examination, to see if they possess the necessary qualifications. Letter-carriers and sorters must be between the ages of 17 and 27 at the date of their original appointment, and shall undergo an examination by a physician to see if they possess the requisite health and strength. Wages and salaries are not exorbitant, but none are discharged except for some fault or dereliction of duty; and after a certain number of years of faithful service, they are permitted to retire on a pension, amounting to from one third to two thirds of their salary, according to the length of time they have served.

We will close our account of the post-offices of Great Britain by giving the revenue and expenditure, the rates of postage, and the various improvements introduced into the post-offices of the principal British colonies since the introduction of the penny postage into England in 1840. The revenue and expenses in each case are for 1854, except for Canada, which is for 1855.

Colonies.	Nature and Date of Improvements.	Rate or Rates of Letter Postage.	Revenue.	Expenses.
		Cents.		
Barbadoes	Inland post (1852), uniform postage and stamps	2	$6,225	$9,750
Canada	Reduced postage (1851) and postage stamps	1 to 5	387,525	510,485
Ceylon	Reduced postage (1846)	2, 3, 6, 9, and 12	38,855	42,975

India	Uniform postage and postage stamps (1854–'55)	1½	1,375,835	1,515,220
Jamaica	Charge by weight instead of pieces (1843)	8, 12, 16, 20, and 24	65,040	50,410
Mauritius	District post-offices and postage stamps	4	2,215	4,900
New Brunswick	Reduced postage and postage stamps (1851)	5	40,650	54,125
Newfoundland	Inland posts (1802), and uniform postage (1858)	5	1,810	3,640
New South Wales	Reduced postage and postage stamps (1851–'54)	2 and 4	120,635	201,665
New Zealand	Uniform postage and postage stamps	4	11,045	11,150
Nova Scotia	Reduced postage and postage stamps (1851–'56)	1½ and 5	27,330	19,595
Prince Edward's Island	Uniform postage (1851)	4	4,715	10,455
South Australia	Uniform postage (1854)	4	37,385	47,790
Tasmania	Reduced postage and postage stamps (1851–'53)	2 and 4	40,990	81,455
Trinidad	Uniform postage and postage stamps (1851)	2	7,665	9,225
Victoria	Reduced rates and postage stamps (1850)	4 and 8	834,745	729,350
Western Australia	Reduced postage and postage stamps (1852–'54)	2 and 4	7,180	10,265
Total	.....	.....	$2,597,445	$3,439,215

Nearly or quite all of the improvements introduced into the colonial post-offices appear to be the direct result of the success of the penny postage in Great Britain. It will be seen that many of them cling to the old absurdity of a number of rates, all entailing great inconvenience on every person that mails a letter, and greatly multiplying the operations and increasing the labor and expense in the post-offices.

V. *Postal Statistics, and Rates of Postage in other Countries.*—There are certain peculiarities and features of interest in many of the Continental post-offices of Europe that deserve notice, leaving the prominent statistics to be given in tabular form. In the German Postal Union, in Prussia, Switzerland, Spain, and some other countries, the post-office undertakes the carriage of passengers and small parcels as well as letters and mail matter. In this species of traffic the government does not hold an absolute monopoly, but, like stage proprietors that get the mail contract, they are enabled to hold an undue competition with all outsiders, resulting from their advantages as mail carriers. In nearly all the Continental cities the government post

makes the delivery of letters a part of the postal business.

The absurdities in some of the postal systems of the Continental states consist generally of a varied scale of charges, and the adoption of so low a standard of weight as to make a great deal of useless labor in the rating of letters, besides putting other states that enter into postal relations with them to serious inconvenience. The half-ounce scale for letters is in use in the United States, Peru, New Granada, Equador, Brazil, Great Britain, Spain, Holland, Denmark, Iceland, Prussia, Austria, Baden, Bavaria, Frankfort-on-the-Maine, Hamburg, Hanover, Lübeck, Saxony, Würtemberg, and sixteen British colonies. The quarter-ounce scale is used only in France, Switzerland, Sardinia, and Tuscany; while a weight equivalent to one-third or three-eighths of an ounce is used in Portugal, Belgium, and Brunswick. Russia, Chili, and Bremen, adopt the ounce scale for single letters, Sweden a weight that is equivalent to about five-eighths of an ounce, and the Kingdom of Naples still uses the old plan of charging by the sheet. The half-ounce scale being in such extensive use, is it too much to expect that the time may soon come when all the principal commercial nations will adopt that standard, without waiting for a uniform system of weights and measures? France is the principal nation now in the way of such an arrangement. By insisting on a quarter-ounce scale for foreign letters, that government puts the public and the postal authorities of other nations to great inconvenience, and there is nothing gained by it. Such a rate can be adopted as will prove remunerative, and by having a scale reducible to greater convenience and simplicity, much labor is saved. To see this in the most striking light, let us look at the former rates in use a few years ago in Spain. Domestic letters were considered single up to six-sixteenths of an ounce, and the postage charged was one real (5 cents), with the addition of one cent for each eighth of an ounce beyond the weight considered as single. Then all letters sent to the Spanish islands were considered single up to *five*-sixteenths of an ounce, and charged thirty-five cents, with the addition of ten cents for every sixteenth of an ounce beyond! Is not this excessive fineness as absurd—except in degree—as it would be to weigh and reckon by the single grain? This old absurdity and inconvenience in weighing and rating letters in Spain has been swept away by the adoption of the regular half-ounce scale. In Great Britain, up to two ounces, there are but three rates of postage for letters, while in the United States there are nine rates. When will the convenience and economy of simplicity in the arrangement of matters having such a vast detail as postal operations be clearly understood by the nations? Let us look at one fact. There are passing through the British Post-office in a year, in round numbers, five hundred million (500,000,000) letters, and each one of these, in the various processes of sorting, rating, stamping, mailing, and delivery, goes through not far from twenty (not less) distinct processes, besides what is done in bulk, like weighing and transportation. This is by the employés of the Post-office, independent of all the care and labor of the public in considering the various charges, rates, weights, and adjustment of differences. Here, then, are *ten thousand million*—let us see how it will look in figures, 10,000,000,000—different and distinct handlings and processes of separate letters, each of them consuming and requiring more or less time, toil, talent, and care; and every useless or needed operation, turn, or thought, bestowed on a letter in its passage through the mail in Great Britain entails at once an additional five hundred million (500,000,000) processes or operations on the postal laborers annually! Will those who make laws for the post-office think of these things? Will it, need it, any longer be a matter of wonder that the annual correspondence of Great Britain has increased from 75 million letters to about 300 millions; that it is all done for a penny a letter, and that about one half of the revenue from this source is clear profit?

POSTAL REVENUE AND EXPENSES OF DIFFERENT NATIONS AT DIFFERENT PERIODS, TOGETHER WITH THE NUMBER OF RATES OF POSTAGE ON SINGLE LETTERS, WITH THOSE RATES AT THE PRESENT TIME (AS NEAR AS IT CAN BE STATED FROM AN EXAMINATION OF OFFICIAL REPORTS), ALL SUMS BEING GIVEN IN UNITED STATES CURRENCY; THE RATES OF POSTAGE IN CENTS, AND THE REVENUE AND EXPENSES IN DOLLARS.

Nearly all of the European (continental) nations make it a part of their postal business to transport passengers and parcels as well as mails. In consequence of this arrangement, an accurate comparison of the financial results of the different postal systems can not be given. The total annual revenue of the post-offices on the Continent of Europe, at the latest dates given above, amounted to $32,403,405—probably one third

of this being for goods and passengers—and the total annual expenses to $24,362,450. The post-offices of South America had an annual revenue of $368,890, with expenses to the amount of $249,235. If we assume that one gross third of the postal revenue and expenses on the Continent of Europe are on account of passenger and parcel traffic, we shall be able to make the following summary statement of the postal affairs of different nations and different parts of the world; the figures standing exclusively for the legitimate postal traffic—letters, papers, and printed documents:

Nations	Revenue.	Expenses.
Great Britain	$14,539,770	$8,391,145
British Colonies	2,497,420	3,146,230
United States	7,620,822	10,407,568
Total	$24,458,012	$21,855,243
Continental Europe	$21,606,270	$16,241,632
South America	336,890	249,235
Total	$21,943,160	$16,490,868
Grand total	$46,401,172	$38,346,111

If we add to the above the one third of the postal revenue of European countries that was deducted for parcel and passenger traffic, we shall have the sum of $57,201,307 as the total annual revenue of all the post-offices in the world (that we have given above), and $46,466,928 as the total annual expenses. Of the legitimate postal traffic—letters and printed matter—more than one half of the revenue is in the United States, Great Britain, and the British colonies.

A fair estimate of the amount of letter correspondence may be arrived at by the following calculation: The rates of postage in Great Britain being much lower than in most other countries, we may assume that one dollar of revenue in that country represents as many letters as two dollars throughout the rest of the world. The annual postal revenue of Great Britain is $14,339,770; of the British Colonies, $2,497,420; and of the rest of the world, $29,563,982. From this we conclude that the correspondence by mail in Great Britain and the British colonies amounts to rather more than the correspondence in all the other nations referred to. The correspondence through British post-offices amounts to about 500,000,000 letters annually, and—including this number—in all the nations under consideration, not far from 1,000,000,000. In this calculation, of course, we do not include China, Turkey, and other countries, of which no statistics are given. Of the fifty-one nations and colonies mentioned in the preceding and a former table (page 1560), thirty-six adopt the half-ounce scale for letters. Ten of the nations and nine British colonies have uniform postage, while in one only (Iceland) the postage is free, the entire expense being defrayed from the national treasury.

The following table has been compiled to show the actual and comparative amount of money paid in postages in each of seven different countries, during the same year (1853), along with the population, and columns, also, showing the cost of each thousand letters, together with the number of letters in a year, the number for each thousand persons, and the money paid annually (on the average) by each thousand persons. The last line gives the same statistics for Great Britain for 1839, the year before the penny postage was established. Except this last, the statistics are all for the year 1853:

Countries.	Population.	Postal Revenue.	Postal Expenses.	Number of Letters.	Cost of 1000 Letters.	Revenue per 1000 Persons.	Letters per 1000 Persons.
Switzerland	2,392,740	$447,572	$341,028	19,773,620	$23	$187	8,239
Holland	3,056,591	288,162	156,784	13,349,859	22	94	4,367
Belgium	4,426,202	755,648	327,118	11,521,975	66	171	2,603
Spain	13,936,218	1,281,761	1,095,398	30,775,986	42	94	2,209
France	35,783,170	9,321,900	6,623,925	150,000,000	39	260	4,192
United States	23,191,876	5,240,724	7,982,757	102,189,143	58	256	4,404
Great Britain	27,833,501	12,872,039	7,003,399	410,817,489	51	462	14,760
Great Britain, 1839	26,988,910	11,955,318	5,784,997	82,470,596	145	443	3,055

In those countries where the post-office engages in passenger and parcel traffic, the revenue has, in the above table, been given only for the letters and mail matter.

VI. *History of the United States Post-office.*—Having taken a rapid survey of the postal affairs of other countries and other times, we will glance at the progress and condition of the post-office in the United States. Probably the earliest mention of a legal post in the British colonies of North America is found in the General Court records of Massachusetts in 1639. We find it there recorded as follows: "It is ordered that notice be given, that Richard Fairbanks, his house in Boston, is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither, are to be left with him; and he is to take care that they are to be dellvered or sent according to the directions; and he is allowed for every letter 1*d.*, and must answer all miscarriages through his own neglect in this kind, provided that no man be compelled to having his own letters except he please." In 1667, in consequence of the uncertainty and loss attending correspondence, a petition was signed by some twenty persons, "*To the Honorable General Court, now sitting in Boston.*" That petition set forth that "several of us being sensible of the loss of letters, whereby merchants, especially with their friends and employers in foreign parts, are greatly damnified; many times the letters are imputed and thrown upon the exchange, so that those who will may take them up; no person, without some satisfaction, being willing to trouble their houses therewith," etc., etc. They then request that the honorable court "will depute some mete person to take in and convey letters according to directions." After due deliberation, they did "make choice of Mr. John Hayward, the scrivener, to be the man." There are no records to show how long John Hayward kept his office, or what amount of business he did. In 1657, the colony of Virginia passed a law requiring each plantation to provide a messenger to convey the government dispatches as they arrived, each planter in succession sending a messenger to the next, and so on to the final destination. The penalty for neglecting this duty was a hogshead of tobacco. In 1672 Governor Lovelace, of New York, established "a post to goe monthly" from New York city to Boston and back. This purported to be in obedience to his Majesty's commands, "who enjoynes all his subjects in their distinct colonys to enter into a strict allyance and correspondency with each other, as likewise for the advancement of negotiation, trade, and civill commerce, and for the speedy intelligence and dispatch of affayres." It gave notice that a messenger would start on the first of January, 1673, and that "If any, therefore, have any small letters or portable goods to be conveyed to Hartford, Connecticott, Boston, or any other parts on the road, they shall be carefully delivered according to the directions, by a sworne messenger and post, who is purposely employed in that affayre. In the interim, those that bee disposed to send letters, lett them bring them to the Secretary's office, where, in a lockt box, they shall be preserved till the messenger calls for them. All persons paying the post before the bagg be sealed up." The mails at this period did not appear to have a very rapid transit. The post-riders set out from New York and Boston simultaneously, on Monday morning, and on the Saturday evening following, they met at the half-way house, Saybrook, Connecticut, where they exchanged mails, and each wended his way back, arriving on Saturday of the following week. At the present time,

instead of two weeks being required, and a semi-monthly mail only, the mails are transported between Boston and New York three times a day, each way, in from eight to eleven hours; two weeks being ample time to convey the mails from New York to Copenhagen, Denmark, to Marseilles, Berlin, Vienna, or Trieste. It is shrewdly suspected that the fatherly care exhibited by King Charles for a mail service, and a "strict allyance and correspondency" between the American colonies, was with an eye to the profits, which all went to a member of the royal family.

In 1683 William Penn established a post-office in Pennsylvania, and appointed Henry Waddy postmaster. The mails were sent to the principal towns in Pennsylvania, and to the neighboring colonies, once a week, the times of departure being regularly published "on the meeting-house door and other public places." Postal affairs in the colonies received marked attention in England, in 1685, on the accession of King James, who owned the Post, and put the profits in his own privy purse, and an order in council was made "for the better correspondence between the Colonies of America." In 1686 an order was made in New York that all letters coming from beyond sea should be delivered at the custom-house. The postage was "four-pence half-penny for a single letter, and nine-pence for every packett or double letter," "one half of the money to be given to the poor," under the direction of the Captain-general and the Council, and the other half to the officers of the custom-house.

In 1691–'92 Thomas Neal, by letters patent, was appointed Postmaster-general, with authority to erect post-offices in the American colonies. It appears, however, that he did not act himself, but appointed Colonel Andrew Hamilton, of New Jersey, Postmaster-general for all the colonies. In 1692, by the recommendation of Colonel Hamilton, the Common Council established a post-office in New York city. It was located in Broadway, opposite the end of Beaver Street. The rates of postage were, for eighty miles or under, four-pence half-penny; from New York to Philadelphia, nine-pence; and to Virginia, twelve-pence. The expense, however, was found greatly to exceed the income. For ten years there was no regular Post further east than Boston, or further west than Philadelphia. Lord Cornbury wrote home, in 1704, saying "there is no other Post upon all this continent. If I have any letter to send to Virginia or to Maryland, I must either send an express, who is often retarded for want of boats to cross those great rivers they must go over, or else for want of horses; or else I must send them by some passengers who are going thither. The least I have known any express to take hence to Virginia has been three weeks." At this period the mail was carried twice a month in stage-coaches, between Boston and New York and Philadelphia; and from New York to Albany by a foot-post, once a month. In 1732 a General Post-office was established in Virginia, and a post-office in each county. In 1736 there was a weekly mail from Philadelphia to New York and Boston. In 1737 Colonel Spottswood, formerly Governor of Virginia, appears to have been Postmaster-general, and he appointed Benjamin Franklin postmaster at Philadelphia. The following is an advertisement from Franklin's newspaper at this period:

"*October 27, 1737.—Notice is hereby given, that the Post-office of Philadelphia is now kept at* B. FRANKLIN'S, *in Market Street, and that Henry Pratt is appointed riding postmaster for all stages between Philadelphia and Newport, in Virginia, who sets out about the beginning of each month, and returns in twenty-four days, by whom gentlemen, merchants, and others, may have their letters carefully conveyed, and business faithfully transacted, he having given good security for the same to the Honorable Colonel Spottswood, Postmaster-general of all his Majesty's dominions in America.*"

Colonel Spottswood died in 1753, and the home government appointed Franklin as his successor, and he held the office for twenty-one years, till 1774, when the difficulties occurring between the colonies and the mother country, Franklin was unceremoniously turned out of office. He sympathized too strongly with the people of the colonies in their wrongs, hardships, and oppressions to be a fit instrument of the crown. He is not the last or the only instance of a postmaster losing his office for political opinions. During Franklin's administration of the Colonial Posts, numerous improvements were made. At one time he took his own conveyance, and, in company with his daughter, made a journey of several hundred miles, visiting all the principal post-offices in Pennsylvania, New Jersey, New York, and New England. With that attention to details which always marks the man of large business capacity, he set about making numerous reforms in the administration of the Post. He had as associate or assistant, Mr. William Hunter. By the terms of their appointment they were to have six hundred pounds a year, *provided they could get it!* Franklin, in giving an account of the Post-office during his administration of its affairs, after he had been turned out of the office by George the Third, makes the following pithy summary:

"The American Post-office had hitherto (*i. e.*, before 1753) never paid any thing to that of Britain. We were to have six hundred pounds a year between us, if we could make that sum out of the profits of the office. To do this, a variety of improvements were necessary; some of these were inevitably, in the beginning, expensive; so that in the first four years the office became above nine hundred pounds in debt to us. But it soon after began to repay us; and before I was displaced by a freak of the minister's, we had brought it to yield three times as much clear revenue to the crown as the Post-office in Ireland. Since that imprudent transaction, they have received from it—not one farthing!"

The practice of sending newspapers in exchange, free, dates from Franklin's administration of the Colonial Post-office. He was editor and publisher of a newspaper, and he received his exchanges free, and accorded the same privilege to other journals. The philosopher undoubtedly soon recovered his equanimity after that "freak of the minister's," for though he suffered official decapitation, he was soon after reinstated in office by a more competent authority, being unanimously appointed Postmaster-general of the United Colonies by the Continental Congress. In 1776 he vacated the office, on being appointed embassador to France. On the 7th of November of that year, Richard Bache was appointed to the office. He held the place for a little over five years, and on the 28th of January, 1782, Ebenezer Hazard was appointed Postmaster-general, and remained in office until the adoption of the Constitution, in 1789, when Samuel Osgood was appointed. The different incumbents of the office of Postmaster-general since the Revolutionary war broke out were as follows:

Benjamin Franklin, in 1775; Richard Bache, 1776; Ebenezer Hazard, 1782; Samuel Osgood, 1789; Timothy Pickering, 1791; Joseph Habersham, 1795; Gideon Granger, 1802; Return J. Meigs, 1814; John M'Lean, 1823; William T. Barry, 1829; Amos Kendall, 1835; John M. Niles, 1840; Francis Granger, March, 1841; Charles A. Wickliffe, September, 1841; Cave Johnson, 1845; Jacob Collamer, 1849; Nathan K. Hall, 1850; Samuel D. Hubbard, 1852; James Campbell, 1853; and Aaron V. Brown, in 1857.

The rates of postage from 1776 to 1816 were from 7 to 33 cents, according to distance. In 1816 the rates were fixed by act of Congress at 6¼, 10, 12½, 18¾, and 25 cents for each single letter, according to distance. These rates remained till the act of 1845, which established the half-ounce scale for single letters, and fixed the rates at five and ten cents.

The act of March 3, 1851, established the following rates: one cent for drop letters, three cents for all single letters (half ounce), for every distance not over three thousand miles, when prepaid, and five cents if not prepaid; and double these rates when over three thousand miles. The law of 1855 fixed the rates at one cent for drop letters, three cents for letters all distances under three thousand miles, and ten cents when over that distance, and all to be prepaid, or retained and sent to the dead-letter office. This law went into operation, as far as it was found practicable, on the first of April, 1855. After the first of January, 1856, all letters were required to be prepaid by stamps. In March, 1856, a law was passed making prepayment compulsory on all transient printed matter; and this law went into effect on the 1st of April, 1856. The inconveniences and inconsistencies of the law making prepayment [illegible] are numerous. At an expense of [illegible] hundred thousand dollars, nearly all letters [illegible] returned to the writers in a brief period of time after they fail or miscarry. The usage of our government is in strong contrast to that of Great Britain, where all dead or returned letters are sent to their writers at once.

It is instructive to observe the progress of our postal correspondence beyond the increase of population and the augmentation of almost all other national commercial transactions. During each period of ten years, from 1790 to 1850, the average increase of the population of the country has been 34 per cent., the exports 42 per cent., the expenses of government 95 per cent., Post-office revenue 120 per cent., and correspondence by mail 140 per cent. Thus, while the population of the country has increased in sixty years seven-fold, letter correspondence has increased four hundred and forty fold, or sixty-three times as fast as the population. In 1790, the letters sent by mail in the United States were estimated at 265,545; and in 1856, 131,450,409. The following table gives, for a period of sixty-seven years, the leading items:

STATISTICS OF THE UNITED STATES POST-OFFICE.

Years	Post-offices	Miles of mail routes	Expense of Transportation.	Total Expenses	Revenue.	Number of Letters.	Population	Letters for each Person.
1790.....	75	1,875	$22,081	$32,140	$37,935	265,545	3,130,000	0·067

Appropriation for gov't. postage	700,000	700,000
Total revenue	$7,411,830	$7,630,822

VII. *The present Condition and future Prospects of the United States Post-office.*—From the official figures given previously, we see that while the correspondence by mail and the postal revenue actually decreased during twenty years of high postage in Great Britain—ending with 1835—the revenue and correspondence both, from the date of low and uniform postage, in 1840, has greatly increased—the latter six hundred per cent. The vast economy in the management of the Post-office in that country is seen in the fact that while the correspondence incerased from 75 millions of letters in 1840, to 478 millions in 1856—at least six-fold—the expense was but little more than doubled. Had it been deemed necessary, but few figures would have been required to show clearly—what was demonstrated by Mr. Rowland Hill—that the slight diminution in the net revenue of the Post-office in Great Britain, conseqnent to the great reduction of postage in 1840, was far more than made up to the national treasury, during each and every year thereafter, in other branches of national income, and all from the direct and sole cause of the activity and prosperity of all business interests, engendered by a reduction in the rates of postage. We believe, and are confident that it is susceptible of a clear demonstration, that the principal reasons why our Post-office has not kept pace with the advancing spirit of the age, and been made as efficient as the post in several other countries, are the following: In the first place, several popular fallacies have been engendered and kept up by official post-office reports. Again, the official heads of this important department, for the last fifteen years, have almost invariably thrown their official and personal influence against all the great improvements urgently demanded by the people; and in carrying out this opposition, several of these officers have exhibited an unwarrantable interference with the legislation of the country. All of the principal improvements have been accomplished, not through their aid, but in the face of their opposition. The annual reports of the Postmaster-general, since 1852, have declared and attempted to prove that the legitimate revenue of the Post-office has been less than its legitimate expenditures, while the contrary has been the fact, as must be evident when we have a complete view of the premises. The true state of the case is—and this is the important matter that has been overlooked—the Post-office has performed a large amount of labor, and consequently been put to great expense, without any clear record or any adequate return.

The payment for and on account of letters and documents transported and delivered by the Post-office for the government—the sum of $700,000—is entirely inadequate to the service performed. To show the amount of "franked" matter sent from Washington alone, the following items were given in an official statement from the postmaster of Washington City to the Post-office Committee of the House of Representatives, as the amount of that description of mail matter for one month—January, 1854.

FREE MAIL MATTER FROM WASHINGTON FOR ONE MONTH.

	Weight.	Postage.
	Pounds.	
Letters from members of Congress	3,446	$4,664
Documents " "	693,508	110,961
Letters from Departments	7,065	6,782
Newspapers (numbering 1,110,020)	111,002	11,100
Total for one month (prepaid rates)	815,021	$133,507
For twelve months " "	9,780,242	1,602,087
Postage for twelve months, if not prepaid	....	3,158,390

The newspapers were not counted, but weighed; and as the newspapers of the country average about one and a half ounces each, these have been considered as averaging ten papers to a pound. The postmaster expressed it as his opinion that the free matter during that month, of which he gave the results, was less than the average quantity. The amount given would make about 5000 tons of "free" matter in a year, from the post-office of the city of Washington alone; or an average for each week-day of fifteen tons. Looking at this $1,602,087 due by government at prepaid rates, for the postage on free matter, outward only, from the city of Washington alone, in a year, it would be a very moderate estimate that should put the postage of the government, at the rate the citizen pays, at $2,500,000 annually. If we look at the revenue and expenses of the Post-office for ten years, and see what appropriations were made for the free matter transported for government, we shall see whether the Post-office actually supported itself or not.

Years.	Postal Expenses.	Revenue from Postages.	Appropriations that were made.	Appropriations that should have been made.
1847	$3,971,275	$3,703,999	$300,448	$2,500,000
1848	4,826,850	4,161,073	....	2,500,000
1849	4,479,049	4,595,176	200,000	2,500,000
1850	5,212,953	5,352,971	200,000	2,500,000
1851	6,024,596	6,251,973	575,880	2,500,000
1852	7,108,450	6,032,537	1,741,445	2,500,000
1853	7,982,757	6,240,724	700,000	2,500,000
1854	8,577,424	6,983,537	700,000	2,500,000
1855	10,044,936	6,711,830	700,000	2,500,000
1856	10,407,868	6,920,822	700,000	2,500,000
Total	$68,756,157	$54,014,652	$5,626,782	$25,000,000

That the Post-office did not support itself from the postage paid by citizens during the last ten years, and

also support the burden of all the "franked" matter thrown on it by government, is evident from the above figures. The "official" statement is, that the entire postal revenue for ten years was $59,641,484, and the expenditures $68,136,197; *therefore* there was a "deficiency," showing that the Post-office did not support itself by $8,494,763. But the reality is this. At the rates of postage now levied, the cost of transporting and delivering the letters and documents for the citizens and the government, for ten years, was as follows:

Postage due and paid by citizens for ten years..	$54,014,652
Postage due (but not all paid) by government...	25,000,000
Total	$79,014,652
Expenses of the Post-office for ten years.....	68,136,197
Post-office earnings exceeded the expenses by...	$10,878,455

It is clearly evident that any attempt to show whether our Post-office supports itself under the present laws, regulations, rates of postage and management, must begin by showing what are its legitimate expenses and what its legitimate income. The theory and practice of our law-makers is in strong contrast to the action of the members of the British Parliament in 1839 and 1840, at the time of the agitation and adoption of the penny postage. They at once abolished and renounced the franking privilege, on the principle that officers of the government could as well afford to pay their own postage as private citizens; that they were in that case put to far less trouble to frank and send documents for others, and that all postage necessary for carrying on the business of the government should be charged to the Treasury, like all other national or government expenses. In reality, we do not know the amount of expenses and burdens that fall on the Post-office, and yet the head of that Department has taken upon himself to say that its income is not sufficient for its legitimate support. If a merchant or man of business were to know the precise amount of income that he actually received, while he was ignorant of a large portion of his expenditures, would he, or could he, conduct and manage his affairs with prudence, judgment, and economy? It is a parallel case with our Post-office, burdened as it is annually with five thousand tons of franked matter.

The history of our Post-office for the last sixteen years discloses the following facts: Letter postage has been reduced from a scale of five rates, running from six to twenty-five cents, and averaging, perhaps, thirteen or fourteen cents a letter; first (in 1845) to five and ten, and next (in 1851) to three, five, and six cents, and lastly (in 1855) to three and ten cents; and yet there has been no sensible diminution of the postal receipts, taking one year with another. Taking the yearly increase of the postal revenue for a number of years before the first reduction as a criterion, the receipts of the Post-office in 1855 and 1856 were as large, if not larger than they would have been under the old rates. And yet the postage on each separate letter averages less than one third the charge previous to 1845. By the side of that fact it may be stated here that in the postal history of all nations there is no instance on record where a reduction of postage, however great, has been followed by any permanent reduction of the postal revenue. In public as in private affairs, the inhabitants of a country extend their patronage just in proportion to the business and economical facilities afforded them.

After the successful introduction of penny postage into Great Britain in 1840, the citizens of the United States commenced holding public meetings and petitioning Congress for a reduction of rates, and other postal improvements. The pressure and agitation were kept up from 1841 to 1845, and during that period the Postmaster-general—the Hon. Charles A. Wickliffe—used every exertion, and brought every influence, official and personal, to defeat the measure. With all this uncalled-for interference with the wishes of the people and the legislation of the country by an executive officer, the bill reducing postage to the two rates of five and ten cents was passed, and went into operation in 1845. The incumbent of this office from 1853 to 1857 —James Campbell—made every possible effort not only to defeat the wishes of the people in having the rates of postage reduced and made uniform, but to raise the then existing prepaid rate of letter postage from three to five cents, and to double all the rates on printed matter. These measures were introduced in a bill, at the solicitation of the Postmaster-general, by the chairman of the House Committee, and at once defeated, receiving only the small minority of thirty-six votes.

The efforts made by the Postmaster-general to raise the rates were successful in increasing the postage from six to ten cents on all letters that are transported over 3000 miles.

It may be uncharitable to hint that our statesmen have heretofore paid so little attention to the postal subject as to be unacquainted with its details, though it is unquestionably true that this branch of government has not received the attention that its importance demands. In examining the postal subject we can not arrive at correct results by any system of generalization, or by wholesale comparisons. It is a question of detail, of calculation, and of fact, in which certain cardinal principles can not be ignored or lost sight of. It is true that the people of Great Britain write many more letters than the people of the United States; and it is equally true that this is the consequence of receiving a far greater amount of postal accommodation for the money they pay. It is eminently true that the large and profitable amount of correspondence passing through the British Post-office is the direct result of low and uniform postage, combined with the great facilities for collecting, distributing, and delivering letters and other mail matter in cities and large towns. While we have populous cities with varied interests that require an immense local correspondence, our postal affairs are conducted in the same manner that they were in the first years of the Republic. Except by the labors of private parties, who are allowed to deliver letters from the post-office, and levy a tax for the service, or to set up private post-offices of their own, for the collection and distribution of mail matter, we have hardly an improvement or facility for distributing letters in cities to-day that did not exist seventy years ago. People who write letters may carry or send them to the post-office, and those to whom they are addressed have the privilege of calling for the same and taking them out. Except through and by the labors of the private postman and carriers, we, as a people, seem to be aware that the greatest want and the most profitable field for postal facilities is in and about our large cities and towns. In the country the distance between post-offices may be reckoned by miles, but in large cities the legitimate wants of the people are not met except by having deliveries many times a day, and places for obtaining stamps and mailing letters at every one or two hundred yards. The relative postal wants of the residents of different city and country districts, and the extent to which those wants are met, in this country and in Great Britain, may be seen by the figures representing the average number of letters written by each person in a year, in the various localities. The figures relating to the annual correspondence in this country are in whole numbers and decimals.

CORRESPONDENCE IN THE UNITED STATES.

Different Localities.	Letters per Person, annually.
Country districts at the South.....	1·6
Country districts at the North.....	3·5
Country districts throughout the Union.....	2·8
All of the Southern States.....	2·9
All of the Northern States.....	6·1
Throughout the United States.....	4·9
City of New Orleans.....	19·7
City of Cincinnati.....	21·2
City of New York.....	30·0
City of Boston.....	40·8

These figures are not supposed to be exact, but they are a very near approximation to the precise number, arrived at by a close calculation, based on the relative population and postal income. The following statement exhibits the annual correspondence per person—in whole numbers—in different localities in Great Britain:

CORRESPONDENCE IN GREAT BRITAIN.

Different Localities.	Letters per Person, annually.
Country districts of the Kingdom	8
Throughout the Kingdom	17
England alone	23
Average in cities	45
In London	48
In Manchester	57

These results are very different from what we see in this country. They all go to establish one clear, indisputable fact. They prove beyond question that the people of cities write from five to twenty times as many letters as the residents of country districts. And as we know that a very large portion of the inhabitants of cities are towns are minors, paupers, vagrants, and ignorant persons, it is clear that the adult male business population have occasion to write from a hundred to a thousand letters each per annum. We know, from the habits and wants of the population in rural districts, that the adult persons who are engaged in agricultural and mechanical pursuits do not usually carry on one-fortieth part as much correspondence as the mercantile classes in cities. Bearing these facts in mind, and remembering that there are from six to twelve deliveries a day in all parts of London, with over five hundred receiving houses and letter-pillars where letters can be mailed—averaging one for every second block or square throughout the city—bearing these facts in mind, we need not be surprised at the widely different results in that country and this, as conveyed in the following authentic figures:

ANNUAL NUMBER OF LETTERS IN DIFFERENT LOCALITIES.

Years.	London Local Letters.	London Mail Letters.	Total London Letters	Total in the United States.	Total in Great Britain.
1847	34,630,817	43,757,540	78,388,357	47,285,757	322,140,243
1848	33,072,747	45,991,153	79,063,900	52,364,810	328,830,184
1849	33,160,398	45,845,683	79,006,081	60,153,862	337,399,199
1850	38,887,841	44,856,170	83,744,014	69,426,452	347,009,071
1851	40,685,052	47,819,499	88,405,451	83,252,735	360,647,187
1852	40,463,207	51,171,423	91,574,630	95,750,524	379,501,199
1853	42,816,814	54,402,923	97,218,737	102,139,148	410,817,489
1854	46,191,569	57,186,159	103,377,728	119,634,418	443,649,201
1855	45,844,963	59,647,540	105,492,512	126,723,425	456,216,176
1856	47,894,708	64,201,321	112,856,029	131,450,409	478,393,893
Total	404,885,519	515,638,520	920,527,039	888,527,549	3,864,670,152

We see by the above that the people of London alone (less than two and a half millions) have written and sent through the post more letters in the last ten years than all the people in the United States, while the population of Great Britain—about the same as in the United States—have written almost five times as many as the people of this country. We must seek for a solution of this in the far greater postal facilities in the United Kingdom, particularly in cities, than in this country. See the gigantic results of a good local post in London. There are almost one half as many letters written and mailed in London, for distribution in the city (local letters, see first column in the preceding table), as are written in a year by all the people in America! Could we get at the results of our local distribution of letters, we should find that the number of letters written in our cities, and distributed by the government post in the place where written—"drop letters," as we very appropriately call them—we should find that they were only about one-fortieth or one-fiftieth part as many as in the cities of Great Britain. In other words, the active business population of our cities write about as many letters to go through the mails to a distance, as the same population do of that class of letters in cities in England; but of local letters, for distribution in the city where they are written, only about one-fortieth part as many.

It is as easily shown that the local correspondence of cities is much more profitable to the Post-office than correspondence that is conveyed hundreds of miles, as it is to demonstrate that the correspondence of cities is of more importance and of greater amount than the correspondence of rural districts. The whole secret of accommodating the people with a good CITY POST, and making it profitable at the same time, consists in having our means adapted to our wants. The mails are sent over the routes between New York and Boston three times a day, twice a day from New York to Washington, once a day from Charleston to New Orleans, once a week between some small country villages, once a fortnight from New York to San Francisco, and once a month from Missouri to Great Salt Lake City. By the very same rule, and for the same reasons, there should be a local distribution of letters in large cities like New York, Boston, and Philadelphia, from six to twelve times a day. The very term "free-letter delivery," as applied to the local distribution of letters in English cities, is a misnomer. It does not exist, nor is it asked for in this country. The local distribution of letters in the cities and towns of Great Britain amounts to just this: One uniform rate of postage is fixed on all single letters—local and otherwise—without regard to distance, and this postage—one penny sterling—pays for transporting the letter to the end of the route; and this, in cities and towns, means to the door of the person addressed. It unquestionably costs a shade less to circulate and deliver letters in a city—those that are mailed there for delivery—than it does to transport them hundreds of miles, and then deliver them. The actual result is this: the large number of local letters in cities, at the postage of one penny for each, pays all the expense of collection and delivery—wages of receivers, mail-men and letter carriers—while these persons collect and deliver all letters that are to go and that come from out of town, without any extra charge, and then the profit on these local letters alone—admitting that the letters from a distance are delivered "free"—is very large. The following table, made up from the official report of the year 1854, needs no explanation:

LOCAL CORRESPONDENCE IN CERTAIN CITIES IN GREAT BRITAIN, WITH THE EXPENSE OF COLLECTION AND DELIVERY.

Cities.	Number of Letters in the Mails.	Local Circulation or Drop Letters.	Gross Revenue from Local Circulation.	Wages of Letter carriers and Receivers.	Net Profit on Local Circulation.
London	57,186,159	46,191,569	$1,385,747	$761,510	$824,037
Liverpool	9,145,802	7,390,042	221,701	27,035	194,666
Manchester	10,088,556	8,149,560	244,487	38,225	206,262
Dublin	6,592,834	5,329,134	159,874	39,940	120,034
Edinburgh	4,208,094	3,401,670	102,050	20,060	81,990
Bristol	4,381,410	3,543,816	106,314	15,855	90,459
Total	91,605,561	74,005,791	$2,220,173	$901,825	$1,518,348

The total number of letter receivers and letter carriers in the United Kingdom, in 1854, with the gross amount of their salaries, was as follows:

	Number.	Salaries.
Letter receivers in the Kingdom ...	4,280	$236,742
Letter carriers in cities and towns..	4,305	804,575
Letter carriers in rural districts	4,326	601,420
Total.....	13,000	$1,642,677

Looking at the results in the two tables given above, we find that the money received for postage on the local letters, in six cities only, amounted to a larger sum than the entire cost of letter carriers and letter receivers throughout the united Kingdom of Great Britain and Ireland! And we may mention, in this connection, that the rural letter carriers penetrate all the country districts of Great Britain, the carriers in their walks going from three to six miles from every village post-office, at least once a day.

The gigantic results shown in the English Post-office are due to three or four simple principles. There is one uniform rate of postage on all single letters—those weighing not to exceed half an ounce—and this same rate also pays the postage on all parcels of printed matter—done up in packages open at the ends—so that with one kind of stamp the citizen prepays more than nineteen-twentieths of all the packages he puts in the post-office. There is in every city and village a letter delivery by carriers, from two to twelve times a day, with convenient places at every one or two hundred yards for posting letters and parcels. There is a system of remitting money by mail, through money orders or drafts, for small sums, between all the principal post-offices; and the money-order business, like the uniform postage, is based on so simple and economical a system, and is carried on with such satisfactory results, that there is combined the greatest convenience and smallest cost to the citizen, and the largest economy of management to the Post-office officials.

It is useless to say that the business of collecting and distributing letters in a city in Europe is any different process, and involves any different principles, from that of distributing letters here; for it is not true. And certainly, so far as correspondence is concerned, our social and commercial wants are like those of the residents of London, Manchester, Paris, and Berlin. Could we get at the amount of letter distribution done by private parties in our large cities, it would be found that there is a far greater correspondence carried on outside of, than through the post. And yet there is no regularity, uniformity, safety, or system, and with all the multifarious appliances, we are wretchedly served, as every one knows. Philadelphia has reported through the government Post-office a less correspondence—or at least a smaller postal revenue—in proportion to population, than any other large city in America. There a private individual carries on a very profitable and extensive system of city letter distribution. The fact is, and it can not be disguised, that our Post-office, being an exclusive government function, for long distances, should not allow private parties to carry it on for short distances in cities. We either want an efficient uniform government Post-office over the entire country, or it should be abolished altogether, or thrown open to private parties. We make the Post-office perform nearly three million dollars' worth of labor for the government, and appropriate for the same out of the Treasury less than a quarter of that sum, and then the government allows private parties to step in and set up a post in the very localities where a good postal establishment is most needed, and where it can be made the most profitable. With any thing like a critical examination of our postal establishment, and to a person of any sagacity, it is clearly evident that in the localities where a post is most needed—large cities—and where it would pay the best, there our post is most notoriously inefficient. The postal establishment labors under the following prominent disadvantages:

First. It performs a large amount of service for the government without adequate compensation. *Second.* There is not a uniform rate of postage, and the labor and expense of conducting the postal business is thereby greatly increased. *Third.* The correspondence of the country has never been stimulated and increased by low and uniform postage and the best postal facilities. *Fourth.* Our local correspondence in cities—the most profitable business of the postal establishment, when on a correct basis—labors under every disadvantage, being the cause, and justly, of constant complaint on the part of the citizens. *Fifth.* In all the large cities, in consequence of the irregularity, uncertainty, and inconveniences of the National Post-office, private posts carry off a large share of the business.

If the above premises are correct, the remedies are neither hard to find or difficult to carry out. Find the amount of matter that is sent "free" by government departments, officers and members of Congress, and have a sum paid or appropriated from some quarter sufficient to meet it. Then make one rate of postage, so low that it will not be exorbitant for single letters and the smallest packages for the shortest distances, and let this rate pay as many descriptions and sizes of written and printed packets as possible. Abolish all private posts in cities, and make a government post that is adequate to the wants of the citizens. It may be safely promised that a convenient, reliable, economical, punctual, and rapid distribution of letters in our cities will meet with all that encouragement and that extensive use that attends a good post in European cities. Send all letters and printed packages—perhaps up to a certain amount, say four or eight postages in one parcel, as is done in Great Britain—whether they are prepaid or not, and if not prepaid, charge double postage. Make a money-order system for remitting money in sums not exceeding twenty or twenty-five dollars; at first between all the larger offices, extending it as it becomes known and understood. Return all "dead" and refused letters to the writers, and enforce the payment of such postages as have not been prepaid.

The question of the most profitable rate or rates of postage may be discussed and examined for years, and we are forced to one conclusion; and that is, that there is no convenient, economical, or just system without UNIFORMITY. The truth is, several of our rates of postage are too low, not allowing a fair compensation, and others are too high. Our rate of one cent for drop letters or local letters, one cent for printed circulars, and one cent for transient newspapers, are all too low. They are not compensating; and if raised to two cents, the charge would not be considered high, provided all letters of half an ounce weight, and printed packages up to four ounces, could be sent any and every distance for the same sum. We want a two-cent rate of postage, with a two-cent postage stamp, and a total abolition of all of the one-cent rates and stamps, and the three-cent rates and stamps. It should be the minimum; that is, no letter or transient package should be mailed or sent the shortest distance for less than this sum. We would pay with this two-cent stamp our city or drop letters—and that should include delivery by a carrier, as carriers should work for salaries, and deliver every thing in cities without extra charge—our letters for all distances in the United States, all circulars, and all packages of printed matter, up to four ounces in weight, that are done up open at the ends. Is it not reasonable to suppose that there would be a sufficient increase in letters for city circulation, and to go to a distance, along with the increase of price of postage on drop letters, on printed circulars, and on transient newspapers, to make up for the loss on the three-cent letters, and the few letters that now pay ten cents? And we must bear in mind that one of the greatest arguments for a uniform rate of postage is the simplicity, economy, and cheapness that it effects in

carrying on the postal business. Twice the number of workers, with a change to a uniform rate, will suffice for an increase of letters six-fold. We have given the exact official figures, showing that the mere handling, sorting, distribution, and delivery of letters (all expenses except transportation) in Great Britain amounted to thirty dollars for each thousand letters, when there were several rates; and but seven dollars—less than one-fourth what it cost formerly—with a uniform postage. UNIFORMITY of postage is the first requisite of the British, as it is of every other postal system where it has been tried.

POSTAL STATISTICS OF THE DIFFERENT STATES.

States.	Postal Revenue, 1856.	Revenue per 1000 Persons.	Number of Letters, 1856	Letters per 1000, 1856.	Postal Expenses, 1856.	Proportion of Expenses to Receipts.	Postal Revenue, with Government Postage added.	Proportion of Expenses to Receipts.	Cost per Letter.

By distributing $2,500,000—the supposed cost of transporting the "franked" matter for government, instead of $700,000, the sum now paid—among the different States, in the proportions of their present postal revenue, the revenue of each State would then be as seen in the last column but two. In the column of postal expenses the complete amount of expenses is not quite all stated, but all is given that is set down under the head of each State, in the official Report of the Department. If the entire sum were given, it would not alter this comparative statement, or much affect the general result. We see by this—the last column but one—that only 50 per cent. of the postal revenue of Massachusetts is used in expenses for that State, 52 per cent. in New York, and so on with the old, the thickly-settled, and the commercial States, while in Texas $268 is expended for every $100 received, and in Arkansas $610 to $100 of revenue. The sums here given as the expenses of each State are not supposed to be the exact amounts required for all the postal expenses within the State—as sometimes a mail route runs through several States, and the expenses of mail transportation over it all falls on or is set down to the State where the route commences. But as these routes generally commence at the East or North, and run West or Southwest, the largest show of expenses is made in the States farthest east. We do not claim as a literal fact that the entire expense of each letter mailed in the State of Massachusetts (see last column of table) amounts, on the average, to one cent five mills, and those in Arkansas to just eighteen cents three mills; but it is a fact that when the amount of correspondence, the postal revenue, and the postal expenses of each and every State are all fairly considered, the proportion of money received in postage in each State is, to each letter mailed in that State, as here given. We know that letters starting in New York sometimes go to Arkansas, Texas, Florida, or New Mexico, and we do not claim that the exact proportion of money due on each letter mailed in each State can be clearly adjusted, and should be charged to each citizen residing in the State. But—and here lies one great argument for a UNIFORM and a LOW rate of postage—we do know, by the preceding authentic figures, that the expense of transporting and distributing letters differs very widely in each State; and the general rule is, that the newer, the more sparsely settled, and the less commercial the State, the larger the proportion of expenses to receipts. To illustrate this in a very striking light, let us compare the postal expenses and receipts, and the amount of correspondence in the two States of New York and Massachusetts, with the amount in all of the Southern States and the region west of the Mississippi River. They stand as follows:

Localities.	Number of Letters.	Postal Revenue.	Postal Expenses.
New York and Massachusetts	40,622,054	$2,750,390	$1,423,305
Southern States and west of Mississippi River	37,686,477	2,739,277	4,318,780

While the amount of correspondence, and the postal revenue in New York and Massachusetts, exceed all south of the Potomac and Ohio, and west of the Mississippi, the expenses are less than one-third. Again, let us divide the Union into three sections, calling them the Northeast, the Middle, and the Southwestern sections, and see the comparative amount of revenue, expenses, letters, cost per 10,000 letters, and per single

letter. The Northeast section comprises New England, New York, New Jersey, and Pennsylvania; the Middle section, from Delaware to the southern boundary of Virginia and Tennessee, and west to the Mississippi, including also Missouri and California; the Southwest section includes the balance, the Gulf States, the Territories, Iowa, Arkansas, and Texas. This is the record:

Section of the Union.	Postal Revenue.	Number of Letters.	Postal Expenses.	Cost per 10,000 Letters.	Single Letter
					c. m.
Northeast section	3,295,533	67,145,120	$2,682,681	$400	1 8
Middle section	2,478,161	47,861,219	3,798,837	794	3 3
Southwest section	813,928	16,444,077	2,489,914	1514	6 7
First two	5,773,694	115,006,332	6,481,218	564	2 4
Last two	3,292,089	64,305,289	6,288,451	978	4 1
Grand total	6,587,622	131,450,409	8,971,132	682	3 0

From these facts we see and know that the expense of transporting and distributing letters is not in proportion to the distance they are carried. We see that all of the letters circulated from Maine, on the east, to Tennessee and Missouri, throughout our northeastern and middle sections, involve an average expense—transportation and every thing included—of two cents four mills a letter. It costs more to send and take care of a letter that goes fifty or a hundred miles in Florida, Arkansas, or Texas, than it does to take one from Portland, Maine, to Memphis, from Boston to St. Louis, or from New York to New Orleans.

Now our Southern brethren will do us the credit to believe that we propose nothing sectional, nothing narrow, and nothing partial. Every single fact, figure, and circumstance goes to prove, beyond all cavil, that correspondence is carried on to a far greater extent in the thickly-settled social and commercial districts of the North and East, than at the South and West. The people in these districts write the largest share of the letters, and pay by far the largest share of the postage, while with them postal expenses are comparatively light. Were there two nations placed in the relative positions of New York and New England on the one hand, and Mississippi, Louisiana, and the States of the South and Southwest on the other, the one could have a self-supporting mail system, at a uniform rate of postage, not to exceed one-quarter what would be required in the other. In the State of New York alone are written annually 29,259,943 letters, while in all of the States south of the Potomac and Ohio Rivers, Missouri, Arkansas, and Texas included, the number is but 31,709,035. The city of New York alone contributes one-tenth of the postal revenue of the nation, and writes one-tenth of the letters, being a larger proportion than is contributed by every State that borders on the Gulf of Mexico.

These are facts, and they are not held up as a reproach, but to illustrate the financial condition of our postal system, and to show that a good, an active, and an economical postal establishment is of vast importance in large towns, cities, and thickly-settled and commercial districts. The people in those localities where many letters are written, where correspondence is the life-blood of the commercial and social system, feel that they have a right to ask that a postal system shall be adapted to the wants of those on whom its support principally falls. We, as a people residing in cities and thickly-settled States, ask for not one single privilege or one charge for service that is not to be accorded to the lonely settler of New Mexico or the planter of Texas, under the same circumstances, but we do ask for a uniform rate of letter postage of just two cents for all distances; and the facts given in this article—and they challenge examination for their general correctness—these facts clearly prove, beyond a doubt, that this rate will be ample to defray the expenses of all, except, perhaps, in some forest frontiers or thinly-settled regions; and there any extra expense—if there is any—should fall on the entire treasury of the nation, instead of being levied as a partial, a special, and an unjust tax on the industrious active classes, who make extensive use of the post-office.

We want and need a convenient number of receiving-houses and letter-pillars in our cities, after the plan of the distribution system in England. These "receiving-houses" do not require to be sub-post-offices, or offices for the delivery of letters, but only for the reception of letters and the sale of stamps. Under these circumstances, a very small salary and a small commission on the sale of stamps, is sufficient to compensate the receiver.

The rights of the citizen are not attended to in this country in the management of "dead letters." In this case we have only to look at the satisfactory and just method adopted in Great Britain. There there is no "Dead-letter Office," but there is a "Returned-letter Office." Letters are not reported "dead" except they are anonymous, or when, from other circumstances, the owner can not be found. There, with the great bulk of the letters, a rapid and secure method of returning "miscarried" letters to the writers is adopted, by means of which every letter is returned on the very day it arrives at the Returned-letter Office. It is done so expeditiously, that a clerk returns 200 per day, and 1200 in a week. At this rate all of our "dead letters" could be returned, at a cost to the nation of less than one hundred thousand dollars. With a system of letter delivery in cities and towns, the refused or miscarried letters could usually be sent to the Department and returned to the writers, in from one to three weeks of the date of mailing. In England, letters that miscarry usually get back to the writers within a week of the date of mailing. Oftentimes these dead or miscarried letters would be of great advantage to the writer, particularly in informing him that his letter had not reached its destination. On the face of it would be written usually, as is practiced in England, the cause of its non-delivery.

Any person who will give it an examination will see that we have at this time a most troublesome, perplexing, and absurd system of rates; and it must, we think, be quite as clear that, in a financial and economical point of view, our proposed scale of rates is satisfactory, simple, economical, and adapted to our wants. —See *Bankers' Magazine*, New York, vol. vii., November and December, 1857. On the United States Postage System, refer to *New Englander*, vi. 393 (Leavitt), i. 392 (Bacon); Hunt's *Merchants' Magazine*, ix. 436, ii. 522 (F. O. J. Smith), x. 250 (W. H. Maclay), x. 27 (J. M. Post Entry. When goods are weighed or measured, and the merchant has got an account thereof at the custom-house, and finds his entry, already made too small, he must make a *post* or additional *entry* for the surplusage, in the same manner as the first was done. As a merchant is always in time, prior to the clearing of the vessel, to make his post, he should take care not to over-enter, to avoid as well the advance, as the trouble of getting back the overplus. However, if this be the case, and an over-entry has been made, and more paid or bonded for customs than the goods

really landed amount to, the land-waiter and surveyor must signify the same, upon oath made, and subscribed by the person so over-entered, that neither he, nor any other person, to his knowledge, had any of the said goods over-entered on board the said ship, or any where landed the same without payment of custom; which oath must be attested by the collector or controller, or their deputies, who then compute the duties, and set down on the back of the certificate, first in words at length, and then in figures, the several sums to be paid.

Potash (Da. *Potaske*; Fr. *Potasse*; Ger. *Pottasche*; It. *Potassa*; Pol. *Potasz*; Russ. *Potasch*). If vegetables be burned, the ashes lixiviated, and the solution boiled to dryness in iron vessels, the mass left behind is the *potash* of commerce—the impure carbonate of potass of chemists. It is intensely alkaline, solid, and colored brown by the admixture of a small portion of vegetable inflammable matter, which generally becomes moist. When potash is calcined in a reverberatory furnace, the coloring matter is destroyed, it assumes a spongy texture, and a whitish pearly lustre; whence it is denominated *pearlash*. The latter generally contains from 60 to 83 or 84 per cent. of pure carbonate of potass. The ashes of those vegetables only which grow at a distance from the sea are employed in the manufacture of potash. Herbaceous plants yield the largest portion, and shrubs more than trees. It is principally manufactured in America, Russia, and Poland, the vast forests of which furnish an inexhaustible supply of ashes.

In some portions of the United States and Canada, where timber is an incumbrance upon the soil, it is felled, piled up in pyramids, and burned, solely with a view to the manufacture of potashes. The ashes are put into wooden cisterns, having a plug at the bottom of one of the sides under a false bottom; a moderate quantity of water is then poured on the mass, and some quicklime is stirred in. After standing for a few hours, so as to take up the soluble matter, the clear liquor is drawn off, evaporated to dryness in iron pots, and finally fused at a red heat into compact masses, which are gray on the outside and pink-colored within. Pearlash is prepared by calcining potashes upon a reverberatory hearth, till the whole carbonaceous matter, and the greater part of the sulphur, be dissipated; then lixiviating the mass in a cistern having a false bottom covered with straw, evaporating the clear lye to dryness in flat iron pans, and stirring it toward the end into white lumpy granulations. All kinds of vegetables do not yield the same proportion of potassa. The more succulent the plant, the more does it afford; for it is only in the juices that the vegetable salts reside, which are converted by incineration into alkaline matter. Herbaceous weeds are more productive of potash than the graminiferous species, or shrubs, and these than trees; and for a like reason twigs and leaves are more productive than timber. But plants in all cases are richest in alkaline salts when they have arrived at maturity. The soil in which they grow also influences the quantity of saline matter.

The following table exhibits the average product in potassa of several plants, according to the researches of Vauquelin, Pertuis, Kirwan, and De Saussure:

In 1000 parts.	Potassa.	In 1000 parts.	Potassa.
Pine or fir	0·45	Dry beech bark	6·00
Poplar	0·75	Fern	6·26
Trefoil	0·75	Large rush	7·22
Beechwood	1·45	Stalk of maize	17·50
Oak	1·53	Bean stalks	20·00
Boxwood	2·26	Bastard chamomile (*Anthemis cotula*, Linn.)	19·60
Willow	2·85	Sunflower stalks	20·30
Elm and maple	3·00	Common nettle	26·03
Wheat straw	3·90	Vetch plant	27·50
Bark of oak twigs	4·20	Thistles in full growth	35·37
Thistles	5·00	Dry straw of wheat before earing	47·00
Flax stems	5·00	Wormwood	73·00
Small rushes	5·08	Fumitory	70·00
Vine shoots	5·50		
Barley straw	5·80		

Stalks of tobacco, potatoes, chestnuts, chestnut husks, broom, heath, furze, tansy, sorrel, vine leaves, beet leaves, orach, and many other plants, abound in potash salts. In Burgundy, the well-known *cendres gravelées* are made by incinerating the lees of wine pressed into cakes, and dried in the sun: the ashes contain fully 16 per cent. of potassa.

Potatoes (Ger. *Kartoffeln*; Du. *Aardappelen*; Fr. *Pommes de terre*; It. *Patate, Pomi di terra*; Sp. *Patatas manchegas*; Russ. *Jabloki semlenie*), the roots of the *Solanum tuberosum*, of innumerable varieties, and too well known to require any description.

Historical Notice.—The common English or Irish potato (*Solanum tuberosum*), so extensively cultivated throughout most of the temperate countries of the civilized globe, contributing, as it does, to the necessities of a large portion of the human race, as well as to the nourishment and fattening of stock, is regarded as of but little less importance in our national economy than maize, wheat, or rice. It has been found in an indigenous state in Chili, on the mountains near Valparaiso and Mendoza; also near Montevideo, Lima, Quito, as well as in Santa Fé de Bogota, and more recently in Mexico, on the flanks of the Orizaba.

The history of this plant, in connection with that of the sweet potato, is involved in obscurity, as the accounts of their introduction into Europe are somewhat conflicting, and often they appear to be confounded with one another. The common kind was doubtless introduced into Spain in the early part of the 16th century, from the neighborhood of Quito, where as well as in all Spanish countries, the tubers are known as *papas*. The first published account of it we find on record is in *La Cronica del Peru*, by Pedro de Cieca, printed at Seville in 1553, in which it is described, and illustrated by an engraving. From Spain it appears to have found its way into Italy, where it assumed the same name as the truffle. It was received by Clusius, at Vienna, in 1598, in whose time it spread rapidly in the south of Europe, and even into Germany. To England it is said to have found its way by a different route, having been brought from Virginia by Raleigh's colonists in 1586, which would seem improbable, as it was unknown in North America at that time, either wild or cultivated; and, besides, Gough, in his edition of *Camden's Britannia*, says it was first planted by Sir Walter Raleigh on his estate at Youghall, near Cork, and that it was cultivated in Ireland before its value was known in England. Gerard, in his *Herbal*, published in 1597, gives a figure of this plant, under the name of *Batata Virginiana*, to distinguish it from the sweet potato, *Batata edulis*, and recommends the root to be eaten as a "delicate dish," but not as a common food. "The sweet potato," says Sir Joseph Banks, "was used in England as a delicacy long before the introduction of our potatoes; it was imported in considerable quantities from Spain and the Canaries, and was supposed to possess the power of restoring decayed vigor." It is related that the common potato was accidentally introduced into England from Ireland at a period somewhat earlier than that noticed by Gerard, in consequence of the wrecking of a vessel on the coast of Lancashire, which had a quantity on board. In 1663, the Royal Society of England took measures for encouraging the cultivation of this vegetable, with the view of preventing famine. Notwithstanding its utility as a food became better known, no high character was attached to it; and the writers on gardening toward the end of the 17th century,

a hundred years or more after its introduction, treated of it rather indifferently. "They are much used in Ireland and America as bread," says one author, "and may be propagated with advantage to poor people." The famous nurserymen, London and Wise, did not consider it worthy of notice in their *Complete Gardener*, published in 1719. But its use gradually spread, as its excellences became better understood. It was near the middle of the last century before it was generally known either in Britain or North America, since which it has been most extensively cultivated. The period of the introduction of the common potato into the British North American colonies is not precisely known.

The culture of this plant extends through the whole of Europe, a large portion of Asia, Australia, the southern and northern parts of Africa, and the adjacent islands. On the American continent, with the exception of some sections of the torrid zone, the culture of this root extends from Labrador on the east, and Nootka Sound on the west, to Cape Horn. It resists more effectually than the cereals the frosts of the North. In this country it is principally confined to the Northern, Middle, and Western States, where, from the coolness of the climate, it acquires a farinaceous consistence highly conducive to the support of animal life. It has never been extensively cultivated in Florida, Alabama, Mississippi, nor Louisiana — perhaps from the greater facility of raising the sweet potato, its more tropical rival. Its perfection, however, depends as much upon the soil as on the climate in which it grows; for in the red loam on the banks of Bayou Bœuf, in Louisiana, where the land is new, it is stated that tubers are produced as large, savory, and as free from water as any raised in other parts of the world. The same may be said of those grown at Bermuda, Madeira, the Canaries, and numerous other ocean isles. The chief varieties cultivated in the Northern States are the Carter, the kidneys, the pink-eyes, the Mercer, the orange, the Sault St. Marie, the Merino, and the Western red; in the Middle and Western States, the Mercer, the long red or Merino, the orange, and the Western red. The yield varies from 50 to 400 bushels and upward per acre, but generally it is below 200 bushels. Within the last ten years an alarming disease, or "rot," has attacked the tubers of this plant about the time they are fully grown. It has not only appeared in nearly every part of our own country, but has spread dismay at times throughout Great Britain and Ireland, and has been felt more or less seriously in every quarter of the globe. To the greater uncertainty attending its cultivation of late years, from this cause, must be attributed the deficiency of the crop of 1849 as compared with that of 1839. This is one of the four agricultural products which, by the present census, appears smaller than it was ten years since.

Sweet Potato.—The sweet potato (*Batata edulis*) is a native of the East Indies, and of intertropical America, and was the "potato" of the old English writers in the early part of the 14th century. It was doubtless introduced into Carolina, Georgia, and Virginia, soon after their settlement by the Europeans, being mentioned as one of the cultivated products of those colonies as early as the year 1648. It grows in excessive abundance throughout the Southern States, and as far north as New Jersey and the southern part of Michigan. The varieties cultivated are the purple, the red, the yellow, and the white, the former of which is confined to the South. The amount of sweet potatoes exported from South Carolina in 1747–'48 was 700 bushels; that of the common potato exported from the United States in 1820–'21, 90,889 bushels; in 1830–'31, 112,875 bushels; in 1840–'41, 136,095 bushels; in 1850–'51, 106,842 bushels. According to the census returns of 1840, the quantity of potatoes of all sorts raised in the Union was 108,298,960 bushels; of 1850, 104,055,989 bushels, of which 38,259,196 bushels were sweet.

Potomac River, in Maryland and Virginia, rises in two branches, the north and the south, in and near the Alleghany Mountains, and forms, through nearly its whole course, the boundary between Virginia and Maryland. It is about 300 miles long, and enters Chesapeake Bay between Point Lookout and Smith's Point by a mouth ten miles wide. At Alexandria it is a mile and a quarter wide, 200 miles from the ocean. It is navigable for ships of the line to the navy-yard in Washington, 300 miles from the sea, and three miles below the head of tide-water. Above this it is obstructed by numerous falls and rapids. — *See* Maryland, Chesapeake.

Pound (Lat. pondus, *weight*), a measure of weight. In England two different pounds are used—the pound avoirdupois, and the pound Troy. The pound avoirdupois weighs 7000 grains Troy, and the pound Troy 5760 grains. The former is divided into 16 ounces, and the latter into 12. The pound sterling was in Saxon times, about A.D. 671, a pound Troy of silver, and a shilling was its twentieth part; consequently the latter was three times as large as it is at present. — Peacham. The value of the Roman *pondo* is not precisely known, though some suppose it was equivalent to an Attic *mina*, or £3 4*s.* 7*d.* Our avoirdupois weight (*avoir du poids*) came from the French, and contains sixteen ounces; it is in proportion to our Troy weight as seventeen to fourteen.—Chambers; see also *Bankers' Magazine*, December, 1857, 456–457. An old pound weight of geographical significance, named Easterling, divided into twelve ounces, was in use among the Anglo-Saxons some centuries before the Norman Conquest. The same weight, called the Tower, and the Moneyers' pound, was styled by early French writers the Roman and the Rochelle pound; also known among the Germans as the Cologne pound. A simple system of exchange, by which a pound of silver money, in tale, was made to equal a pound in gross weight, had been arranged by Charles the Great, in France, toward the end of the eighth century. In Britain, under the First William, of Normandy, an ordinance declared, "The weights and measures throughout the kingdom shall remain as our worthy predecessors have established." Queen Elizabeth ordered the ounce of silver, in England, to be cut into sixty pennies; so that the penny, formerly the twentieth of an ounce, thenceforth became the sixtieth part! From the termination of Queen Elizabeth's reign the coinage of English silver has generally retained a purity of 925 thousandths, called the "Sterling Standard." Another pound weight, also divided into twelve ounces, had been brought from Cairo, in Egypt, to Troyes of Champagne, in France, during the Crusades. Carried into England by foreign goldsmiths, Lombard merchants, possibly from Venice, about the year 1496, it gradually superseded the old Easterling weights, and found access into the British Mint, by decision of Henry VIII. In 1543 this king began to debase the fineness of the silver coins, and also reduced their standard weight. The British statute of 1266 established two common measures for money, weights, dry and wet quantities, with presumed consent of the people and approval by the king, which seem to render "wheat and silver money the two weights of the balance, the natural tests and standards of each other." Unfortunately for such decision, neither wheat corn grains nor silver are by nature exact weights suited for a standard, "a rule by which other things may be correctly compared, adjusted, and valued." The accredited proportions of these old measures being accessible an attempt has been made to test their quantities. Edward IV., in 1461, struck a gold coin of the value of ten shillings, named an "angel," because such an image was represented upon the face of it, with the likeness of a ship on the reverse. Henry IV. (1483 to 1509) introduced "the sovereign," or "rose noble," of gold. "The guinea," designed to be of the value of twenty shillings, but requiring subsequent correction, was not ordained till the reign of Charles II. in England. In 1821 a committee of the Royal Society, to whom the matter had been referred, proposed, and it was so decided, by act of George IV., in 1824, 1st. That the parliamentary standard yard, made by Bird, in 1760, be henceforth the legal standard of the British empire; 2d. That the parliamentary standard Troy pound weight, made in 1758, continue unaltered; 3d. That seven thousand grains be declared to constitute the pound-weight avoirdupois, now called the British imperial pound. By act of Congress of the United States, in 1828, "the brass Troy pound weight, procured by the Minister of the United States at London, in the year 1827, for the use of the Mint, shall be *the standard* of the Mint of the United States, conformably to which the coinage thereof shall be regulated." Yet we possess *three several standing weights for coinage accounts, each one derived from a distinct unitary measure taken from as many different nations.* 1st. We have a Troy standard for *quantities*, from Britain; 2d. A metrical standard for *qualities*, from France; 3d. An avoirdupois standard for *proportions*, from Spain. The sole remnant retained from the original scale of the mother country being the Troy ounce, now divided and multiplied *decimally.* — *Report* of Dr. J. H. Gibbon of the United States Mint, North Carolina. *See* Penny.

Pratique. The writing or license of this name was originally addressed by the Southern nations to the ports of Italy to which vessels were bound, and signified that the ship so licensed came from a place or country in a healthy state, and no way infected with the plague or other contagious disease. The pratique is now called a bill of health, and is still of the same intent and import.—Ashe.

Precious Metals, a designation frequently applied to gold and silver. We have given, under the articles Gold and Silver, a short account of each metal; and we now propose laying before the reader some details with respect to their supply and consumption. To enter fully into this interesting and difficult subject would require a long essay, or rather a large volume. Mr. Jacob published in 1831 an "Historical Inquiry into the Production and Consumption of the Precious Metals," in which he takes up the subject at the earliest period, and continues it to the above epoch. And though far from being so learned, complete, or satisfactory as might have been expected, this work contains a good deal of valuable information, and deserves the attention of those who take an interest in such inquiries. But within the last five or six years the subject has acquired an interest and importance with which it was not previously invested.

Supply of the Precious Metals. — Since the discovery of America, the far greater part of the supplies of gold and silver have been derived from that continent. Previously to the publication of Humboldt's great work, "*Essai Politique sur la Nouvelle Espagne*," several estimates, some of them framed by individuals of great intelligence, were in circulation, of the quantities of gold and silver imported from America. They, however, differed widely from each other, and were all framed from comparatively limited sources of information. Humboldt brought these estimates together as follows:

Authors.	Epochs.	Dollars.
Estariz	1492–1724	3,536,000,000
Solorzano	1492–1628	1,500,000,000
Moncada	1492–1505	2,000,000,000
Navarete	1510–1617	1,536,000,000
Raynal	1492–1780	6,154,000,000
Robertson	1492–1775	8,800,000,000
Necker	1763–1777	304,000,000
Gerboux	1724–1800	1,600,000,000
The Author of the *Recherches sur le Commerce*, Amsterdam, 1779	1492–1775	5,072,000,000

—*Essai sur la Nouvelle Espagne*, tome III.

But these have been wholly superseded by the more

extensive and laborious investigations of Humboldt. This illustrious traveler, besides being acquainted with all that had been written on the subject, and having ready access to official sources of information unknown to the writers already alluded to, was well versed in the theory and practice of mining, and critically examined several of the most celebrated mines. He was, therefore, incomparably better qualified for forming correct conclusions as to the past and present productiveness of the mines than any of those who had hitherto speculated on the subject. His statements have, indeed, been accused of exaggeration; and we incline to think that there are grounds for believing that this charge is, in some measure, well founded, particularly as respects the accounts of the profits made by mining, and of the extent to which the supplies of the precious metals may be increased. But this criticism applies, if at all, in a very inferior degree to the accounts Humboldt has given of the total produce of the mines, and the exports to Europe. And making every allowance for the imperfection inseparable from such investigations, it is still true that the statements in question, and the inquiries on which they are founded, are among the most valuable contributions that have been made to statistical science. According to Humboldt, the annual average supplies of the precious metals derived from America have been as follows:

	Dollars a Year at an Average.
From 1492 to 1500	250,000
" 1500 to 1545	3,000,000
" 1545 to 1600	11,000,000
" 1600 to 1700	16,000,000
" 1700 to 1750	22,500,000
" 1750 to 1803	35,300,000

—*Essai sur la Nouvelle Espagne*, iii.

The following is Humboldt's estimate of the annual produce of the mines of America at the commencement of the 19th century:

Political Divisions.	Gold.		Silver.		Value of the Gold and Silver in Dollars.
	Marks of Castile.	Kilogs.	Marks of Castile.	Kilogs.	
Vice-royalty of New Spain	7,000	1,609	2,883,220	667,512	23,000,000
Vice-royalty of Peru	3,400	782	614,030	140,478	6,240,000
Captain-generalship of Chili	12,212	2,807	29,700	6,827	2,060,000
Vice-royalty of Buenos Ayres	2,200	506	481,330	110,764	4,850,000
Vice-royalty of New Granada	20,505	4,714	....	....	2,000,000
Brazil	29,900	6,573	....	....	4,360,000
Total	75,217	17,291	3,400,840	785,581	43,500,000

Humboldt further estimated the annual produce of the European mines of Hungary, Saxony, etc., and those of Northern Asia, at the same period, at about £1,000,000 more. The *quantity* of gold produced in America at the beginning of the century was to the quantity of silver as 1 to 40; in Europe the proportions were as 1 to 10. The *value* of equal quantities of gold and silver were then in the proportion of 15 or 15½ to 1. From 1800 to 1810 the yield of the American mines continued to increase; and their produce, and that of the European and Russian mines, was then probably rather above than below $55,000,000. But in the last-mentioned year the contest began which terminated in the dissolution of the connection between Spain and her American colonies. The convulsions and insecurity arising out of this struggle—the proscription of the old Spanish families, to whom the mines principally belonged, who repaired, with the wrecks of their fortunes, some to Cuba, some to Spain, and some to Bordeaux and the south of France—caused the abandonment of several of the mines, and an extraordinary falling off in the amount of their produce. There are no means of estimating the precise extent of this decline; but according to Jacob, who collected and compared all the existing information on the subject, the total average produce of the American mines, inclusive of Brazil, during the twenty years ending with 1829, may be estimated at $20,000,000 a year; being less than half their produce at the beginning of the century!—Jacob on *Precious Metals*. It has, however, been supposed that Jacob rather exaggerated the falling off. And, at all events, the supplies of bullion obtained from Mexico and South America began, soon after the publication of his work (1831), to increase; and, notwithstanding the anarchy to which they have continued to be a prey, that increase has been maintained down to the year 1853. It appears from the returns sent home by the British consuls that the coinage of gold and silver in the Mexican mints amounted in 1817 to $16,923,948, and in 1818 to $19,506,754. But it is well known that considerable quantities of these metals are raised and exported from Mexico without being brought to the mints to be coined. And taking this item into account, we shall not, perhaps, be very wide of the mark if we estimate the entire produce of the Mexican mines in 1847 and 1848 at about 19 and 21½ millions of dollars, of which from 17 to 20½ millions were in silver. In 1842, Mr. B. H. Wilson, consul in Peru, estimated the produce of the Peruvian mines at about $5,210,000 a year.—*Parliamentary Paper*, No. 476, Session 1843. And it has since increased to $6,500,000 or $7,000,000. The produce of the Bolivian mines is usually estimated at about half the produce of those of Peru. In 1850 the produce of the Chilian mines, according to the official returns, amounted to $7,920,671.—*Annuaire de l'Economie Politique*, 1853.

Birkmyre's estimate of the production of the precious metals in 1846 and 1850, the most elaborate and valuable of any hitherto published, appeared in the London *Times* of the 19th May, 1851. We subjoin some of its principal portions.

"The quantities of gold and silver produced at the under-mentioned epochs were:

"In 1801 the quantity of pure gold produced in America was 46,331 lbs.; in Europe and Northern Asia (exclusive of China and Japan), 4,916 lbs.; total produce, 51,247 lbs.=55,910 lbs. British standard gold= £2,612,200.

"In 1846 the quantity of pure gold produced in America was 25,503 lbs.; in Europe, Africa, and Asia (exclusive of China and Japan), 89,171 lbs.; total produce, 114,674 lbs.=125,108 lbs. British standard gold= £5,846,721.

"In 1850 the quantity of pure gold produced in America was 261,731 lbs.; in Europe, Africa, and Asia (exclusive of China and Japan), 104,219 lbs.; total produce, 365,950 lbs.=399,247 lbs. British standard gold=£18,654,322.

"The above quantities are probably less than the actual production. The duties on gold in Russia on the produce of the private mines are heavy, varying from 12 to 24 per cent.; in Austria they amount to 10 per cent., in Brazil to 5 per cent., and are understood to lead to a great deal of smuggling. In other countries, such as the United States, where there are no duties, the gold and silver stated in the table are only the quantities brought to the mints to be coined, there being no means of determining the quantity used in jewelry and other arts and manufactures."

The exhaustion of the precious metals in manufactures and the arts throughout Europe and the United States probably exceeds the ordinary estimates. It is known that in England alone the weekly consumption of fine gold is equivalent to 600 ounces—used largely in gilding metals by the electrotype and the water-gilding processes.

COMPARATIVE TABLE, SHEWING THE ANNUAL PRODUCE (APPROXIMATE CALCULATION) IN VALUE OF FINE GOLD AND SILVER FOR 1846 AND 1850, THE FIRST BEING TWO YEARS BEFORE THE DISCOVERY OF THE RICH DEPOSITS OF GOLD IN CALIFORNIA; THE LATTER TWO YEARS AFTER THE DISCOVERY.

* Exclusive of China and Japan, which produce large quantities of gold and silver, the amount of which is quite unknown to Europeans.

Some small portion of the quantities exported to Egypt was probably detained in that country or forwarded to Australia. But by far the greater part, perhaps not less than nineteen-twentieths of the whole, was destined for, and went to, India. But although India did not, for several years prior to 1850, derive any considerable supply of bullion from Europe, she drew during that period large supplies from China. This was a consequence of the vast increase in the importations of opium into the latter. With the exception of tea and silk, China has few native products, other than the precious metals, fit for foreign markets. And the exports of the former being not much more than sufficient to pay for the products sent to her from Europe and America, a very considerable part of the cotton and opium imported from India is paid for in bullion, the increased exports of which are said to have latterly brought serious difficulties. It appears, for example, that at an average of the seventeen years ending with 1850–'51, the annual value of the merchandise exported from India to China amounted to £4,564,400 a year, and that of the merchandise imported to only £643,210, leaving a balance of no less than £3,921,190 a year to be paid in bullion, and in drafts on London and other places indebted to China. The following table, which is deduced from the account compiled by the Indian custom-house, shows the balance between the importation and exportation of treasure into and from India, for 17 years, 1834–'51. Since 1851 this current of gold and silver from Europe has largely increased, swelling the hoards of treasure in China and India.

ACCOUNT OF THE IMPORTS AND EXPORTS OF TREASURE INTO AND FROM INDIA DURING EACH OF THE 17 YEARS ENDING WITH 1850–'51.

Years.	Imports.	Exports.	Excess of Imports.
1834–'35	£1,813,023	£194,741	£1,618,282
1835–'36	2,146,465	108,109	2,038,353
1836–'37	2,036,167	263,924	1,772,243
1837–'38	2,610,101	310,656	2,299,445
1838–'39	3,010,920	347,906	2,663,014
1839–'40	1,945,264	470,523	1,474,741
1840–'41	1,786,253	366,486	1,419,767
1841–'42	1,841,375	515,076	1,326,299
1842–'43	3,443,292	215,797	3,227,495
1843–'44	4,794,678	746,076	4,048 602
1844–'45	3,752,472	1,106,840	2,645,632
1845–'46	2,495,150	816,028	679,921
1846–'47	2,939,922	713,870	2,226,052
1847–'48	1,973,391	1,426,018	547,373
1848–'49	4,204,503	2,539,743	1,664,760
1849–'50	3,396,807	971,244	2,426,562
1850–'51	3,811,809	541,289	3,270,520
Total excess of imports			£36,427,905
Average annual excess of imports			2,142,818

Now it appears from this table that the imports of bullion into India during the seventeen years ending with 1850–'51, exceeded the exports by the gross sum of £36,427,905, being at the rate of £2,142,818 a year. The following tables show the countries from which the bullion imported into India during the four years ending with 1850–'51 was derived, and those to which the bullion exported was sent.

The accumulations of gold from California and Australia have created a strong desire for India and China goods, for which specie must be paid in lieu of domestic goods or produce from England or the United States.

It appears from these tables that China furnished two-thirds or more of all the bullion imported into India during the four years ending with 1850-'51; and that till the last-mentioned year the imports from Europe were quite inconsiderable, and greatly exceeded by the exports to it. China, indeed, has been long known to be both an importer and an exporter of bullion. But it is only within the last few years, or since the importations of opium became so immense, that her exports of bullion have become so very large as to make them productive of much inconvenience. The imports of bullion into India from the United States have, till recently, been too inconsiderable to deserve notice. A direct intercourse has now been commenced between San Francisco and the eastern hemisphere; but hitherto all shipments of bullion to India and China on American account have been made through London. During the year ending the 30th June, 1852, the Americans sent gold and silver to the amount of £4,127,379 to England. But though the value of their imports from India and China during that year amounted to $14,818,991, while that of their exports thither amounted to only $3,267,675, they did not send to either a single dollar or a single dollar's worth of gold or silver direct from America.—*Report on Commerce and Navigation of the United States for* 1852, p. 36, *et seq.*

But under such circumstances there will be a corresponding increase of demand in India for the bullion of Australia and America. Indeed, the probability seems to be, from the late extraordinary importation of bullion from Europe, that the supply from China and elsewhere, notwithstanding its magnitude, had not sufficed fully to meet the wants of India. And independent of this circumstance, it is plain that a slight fall in the value of bullion in other countries would render it a still more advantageous article of export to India. And taking the vast extent and population of the peninsula into account, and the habit, universally prevalent in it, of hoarding the precious metals, it is impossible to say, supposing the treasure-current to continue to set in an easterly direction, how great a quantity of bullion might be thrown upon the markets of India and the adjacent countries before any very sensible reduction of its value was manifested. It is difficult satisfactorily to account for the extraordinary exportation of bullion to India in 1850-'52. Most probably it has been owing partly to circumstances connected with the demand for it in India, and partly to those peculiar to its supply in England and the United States. A certain portion (about $15,000,000) of the annual imports from India and China consists of remittances on account of the East India Company's home charges. But independently of this item, the imports of Indian and Chinese goods into England and the United States have latterly been so very great, that they have left a balance to be defrayed by the export of specie. Most probably, also, the occupation of the Punjab has occasioned a demand for additional supplies of currency for that province, while considerable quantities would be wanted for the Burmese expedition. The refusal to receive gold in payment of revenue, though its influence has been exaggerated, has no doubt contributed to bring about the same result, or to increase the demand for silver in India. And it further appears that the balances of treasure belonging to the Indian government in its different treasuries throughout India have lately increased to an inconvenient extent, or to about 16 millions sterling, when from 8 to 10 millions would suffice for every purpose of regularity and security. But measures are now (1853) in progress connected with the liquidation of a portion of the Indian debt which will set free a considerable portion of this surplus treasure; and will thus have the double effect of diminishing or stopping the demand for silver in India, and of enabling the country to avail itself of the services of the capital which has been abstracted from the great work of production.—See an able article in the *Economist*, 3d December, 1853. It would also seem that while circumstances were occurring in India which account for the origin of the drain for bullion to that quarter and its continuance, there was simultaneously an excess of silver in America and Europe, occasioned by the substitution of gold for that metal in the currencies of the United States and of France. And such being the case, the renewed exportation of bullion to the East appears to be sufficiently accounted for, and to have been almost a matter of course.

In addition to the increased product in the American mines, there has been within the last twenty years an extraordinary increase in the produce of the Russo-Asiatic mines and washings, or rather of the latter. In 1830, for example, the produce of the Siberian gold washings was estimated at only 5½ poods; whereas it had increased in 1840 to above 240 poods, and in 1847 to no fewer than 1361 poods. In addition to the washings the Ural mines yield from 310 to 320 poods gold. The produce from both sources amounted in 1847, according to the official returns, to 1741 poods. But it has not been so great since, being in

1848	1736	poods.
1849	1587	"
1850	1485	"
1851	1432	"

The official authorities ascribe this falling off to the exhaustion of the deposits, and the unskilfulness of those engaged in the business. But it is doubtful whether the falling off be not more apparent than real, and whether it be not occasioned by the enormous taxes which have been imposed of late years on the gold obtained from the washings. The principal tax varies according to the produce, being 5 per cent. on washings that yield from 1 to 2 poods per annum, increasing by various steps till it amounts to 32 per cent. on those which yield 50 poods. And there are other duties which, though less in amount, are of the same oppressive character.

These exorbitant duties have, no doubt, tended to lessen the produce of the washings. It is, however,

all but certain that their principal effect has been to defeat themselves by tempting the parties concerned to adopt every means by which they might be evaded; and the notorious corruption of the Russian revenue officers renders this comparatively easy. Perhaps, under the circumstances, we may not be far wrong in supposing that from a third part to a half of the produce of the washings is exempted from the duty. But taking it at a third, and supposing the taxed produce of the washings to have amounted in 1851 to 1117 poods, the real produce would be 1489 poods; to which if we add 315 poods for the produce of the mines of the Oural, the aggregate total would amount to 1804 poods. And this, equal to 72,160 lbs. Troy, makes over $18,905,000.

There has also been of late a considerable increase in the yield of the Spanish mines, which is at present supposed to amount to from $2,250,000 to $2,500,000 a year. Including the silver raised in Russia and elsewhere, and that obtained from the refining of lead, the produce of which in the United Kingdom exceeds $1,000,000 a year (*see* LEAD), the total annual production of the precious metals in Europe may be roughly estimated at about $7,500,000. On the whole, therefore, it would seem (excluding the produce of the Californian and Australian gold fields) that the aggregate production of the precious metals in Europe, America, and Asiatic Russia, may be supposed to have amounted in 1850–'51 (and it is probably about the same at present, 1853) to $70,425,000, being about $15,000,000 greater than their production in 1810, when the American mines had attained their maximum degree of productiveness. Notwithstanding the large addition made to the supply of gold by the Siberian washings, it appears to have been nearly balanced by the excess of silver produced in America and elsewhere. And the old proportion of about 15 to 1 between the values of gold and silver does not appear to have been sensibly affected previously to the discovery of the auriferous deposits in California and Australia.

Supplies of Gold from California and Australia.—But the discovery of these deposits threatens to bring about a most material change in the real, and perhaps also in the comparative values of the precious metals; and is, indeed, among the most remarkable events of which economical history has preserved any account. The gold is found in the *debris* of the quartz rocks in which it had been imbedded, sometimes in grains and flakes, and sometimes in lumps (nuggets), of varying, but occasionally of considerable magnitude. In some localities it is comparatively abundant; and the yield, both in California and Australia, is quite unprecedented, and such as would not previously have been conceived possible. The Californian deposits were discovered late in May or early in June, 1848; and notwithstanding the remoteness of the country, and the fact of its being almost destitute of inhabitants, above 5000 persons were attracted to the spot by the end of the season, who are supposed to have realized above £5,000,000. The news of the discovery and of the unexampled richness of the gold fields having spread on all sides with electrical rapidity, occasioned an extraordinary influx of immigrants from most parts of the world into California. The supplies of gold attained to an unexampled magnitude; cities rose in the wilderness as if by enchantment; the great Bay of San Francisco, which had hitherto been entirely deserted, was crowded with ships and steamers from the most distant countries; and California is now one of the States of the Union, with a population of from 250,000 to 300,000.—*See articles* GOLD, CALIFORNIA, and PRICES, for the production of gold up to the present time.

In addition to the regular shipments, very large amounts, of which no account is taken, are conveyed away from California by parties returning to Mexico, to the Eastern States, Europe, and China. Of these various estimates have been made; but the prevalent opinion in the best-informed quarters seem to be that, when they are included, and allowance is also made for the quantity retained at home, the total yield of gold in California in 1852 may be moderately reckoned at from $40,000,000 to $50,000,000.

But vast as it certainly is, this production is exceeded by that of Australia. The deposits in the latter were not discovered till 1851. And they are so very rich, and the influx of immigrants has been so extraordinary, that the gold fields of Victoria only are estimated to have produced in 1852 no fewer than 1,247,657 oz., which, taken at the rate of $18 an oz., gives a gross amount of $76,457,826—(Statement by Mr. KHULL, of Melbourne); to which, adding $15,000,000 for the estimated produce of the Sydney or New South Wales gold fields, the total produce of the continent will amount to $91,457,826. On the whole, therefore, the present annual supply of gold and silver may be estimated at about £47,000,000 or $209,905,000; viz.,

America (except California)	$43,500,000
Europe	7,500,000
Russo-Asiatic provinces	18,905,000
California	45,000,000
Australia	95,000,000
Total	$209,905,000

Consumption of the Precious Metals.—In order to form a reasonable conjecture in regard to the probable influence of this vast supply of the precious metals, it is necessary to inquire into their uses and probable consumption. And this inquiry, we regret to say, is still more difficult, and more likely to be infected with errors, than the inquiry in regard to their production. The precious metals are used as coin or currency to facilitate exchanges; as wealth which may be conveniently kept or hoarded; and they are used in the arts, as plate, in gilding, etc. The quantities employed in these functions are very large indeed. They vary, however, in different countries and periods with the circumstances peculiar to each; such, for example, as the greater or less abundance of paper money, and the degree in which the use of coins is lessened by the various devices resorted to for economizing currency; the fashion, as to plate and furniture; the feeling of security at the time; and a number of other circumstances, all liable to great and sometimes sudden changes. The gold and silver employed in Great Britain as currency, and in the customary reserves in the hands of the bankers, is supposed to amount to at least $200,000,000. In France the precious metals employed in the same way probably amount to double that sum, or to $400,000,000. The amount in the United States employed for the same purposes may be stated at $275,000,000. And we believe that we may estimate the entire sum employed as currency in Europe, America (North and South), Australia, the Cape of Good Hope, and Algeria, at about $1,900,000,000. It would be inconsistent with the objects of this article, and with the limits within which it must be confined, to engage in a discussion of the numerous, and often conflicting, statements and details on which this estimate has been founded. Some information with respect to it may be found in Chevalier's valuable treatise *De la Monnaie* (p. 326, etc.), Paris, 1850; in Stirling's *Gold Discoveries*, p. 182; in the learned and excellent tract of Tegoborski, *Essai de la Découverte des Gites Aurifères en Californie et en Australie*, etc., p. 65; and in a host of other publications. The precious metals in circulation in Russia in the early part of 1851 were estimated in the *Petersburg Gazette* (October 12, 1852) at 326,000,000 roubles, equal, at 80 cents per rouble, to $260,000,000. The greater part (190,000,000 roubles) of this currency consisted of gold. Now, supposing this sum to be employed, as above stated, as currency, we have first to inquire into its probable wear and tear and loss, and then into the probable rate of its increase. And taking into account the extraordinary extension of navigation, and the proportional risk of loss from shipwreck and other casualties, we are disposed to think that the

annual wear and tear and loss of coin may be estimated at about 1½ per cent. of the entire mass of the currency, which, taking the latter at $1,900,000,000, would amount to $28,500,000 a year. It is difficult to form any probable estimate of the rate at which the bullion used as currency may be likely to increase, supposing its value not to fall off. But considering the extremely rapid increase of refinement and population in most parts of the civilized world, and especially in America and Australia, we scarcely think that we shall be exaggerating if we estimate this increase at 3 per cent.; which on $1,900,000,000 would amount to $57,000,000 a year. It is impossible, however, supposing this estimate not to be very wide of the mark at present, to conjecture how long the currency will go on increasing in this ratio. It may, indeed, be safely taken for granted that the sphere of civilization and commerce is destined rapidly to expand. But their expansion will, no doubt, be accompanied with various contrivances for economizing the use of metallic money, so that the quantity of it in circulation can hardly be supposed to increase for any very lengthened period at the rate stated above. If it did, it would absorb an immense supply of gold. In barbarous countries, and in those entering on the career of civilization, the coins afloat may increase at the rate of 3 or 5 per cent., or more. But in countries which are more advanced its increase will be less, perhaps, than even 1 per cent.

It is equally difficult to acquire any satisfactory information in regard to the quantity of bullion consumed in the arts. Jacob estimated its amount in Europe and America, in 1850, at about $29,500,000 a year. This estimate was in various respects wide of the mark, and it was, on the whole, considerably under the true amount. And supposing the consumption of the precious metals in the arts to have amounted to 32½ or 35 million dollars in 1850, it must now be much greater. There has every where, but more especially in England, America, Germany, and Russia, been an extraordinary increase of population and wealth during the last twenty-seven years. And the taste for plate, splendid furniture, and luxurious accommodations of all sorts, has certainly increased in at least an equal degree. It is well known that speculators and those who rapidly attain to affluence are the principal buyers of plate and other costly articles. And taking these and other circumstances into account, we are disposed to conclude that the expenditure of bullion in the arts in Europe, America, and Australia can not at present (1853) be under, if it do not exceed, 70 million dollars a year. But of this a portion, estimated at about one-fifth or 20 per cent., is supposed to be obtained from the fusion of old plate, the burning of lace, picture frames, etc. And hence, if we deduct from the 70 million dollars used in the arts 20 per cent. for the old bullion, we have $56,000,000 for the total quantity of the supplies from the mines annually disposed of in this way; a considerable portion of which, including that used in the gilding of rooms, books, harness, buttons, etc., can never be again recovered or applied to any useful purpose. This quantity, however great it may appear to be, will be increased with the increase of population, and the spread of refinement and the arts; and it will also be certainly increased by any thing like a considerable fall in the value of bullion. Hence it would appear, putting these items together, that the regular annual consumption of bullion as currency and in the arts amounts to about $141,500,000; viz.,

Wear and tear, and loss of coin	$28,500,000
Increase of currency	57,000,000
Used in the arts	56,000,000
Total	$141,500,000

It may be said, perhaps, that these estimates must be exaggerated, inasmuch as the sum which, it appears from them, is annually consumed exceeds the entire produce of the mines previously to the supplies from California and Australia. But while we admit the fact to be as stated, we deny the inference which is attempted to be drawn from it. The truth is, that while the discovery of the Californian and Australian deposits has added in so great a degree to the supply of bullion, it has also added very largely to its consumption. It has given an unparalleled stimulus to emigration and commerce. The rise of wages and prices consequent on these extraordinary mutations, and on the increased exports of produce which they have occasioned, is making itself felt in the United States as well as in Europe; and hence, consequently, as well as there, a greater supply of bullion will be required to serve as currency. And while this influence is operating on the one hand, on the other the swarms of *parvenus* who are returning from the gold fields, with pockets stuffed with the produce of all sorts of successful adventures, are every where contributing to increase the demand for all sorts of things, but especially for plate, jewelry, and other ostentatious finery.

Exportation of Gold and Silver to the East.—Besides the countries already mentioned, there is a vast portion of the earth's surface, including Turkey in Asia, Persia, Hindostan, China, and other Eastern territories, into which bullion has been largely imported from the remotest era. Humboldt estimated that, of the entire produce of the American mines at the beginning of this century, amounting, as already seen, to $48,500,000, no less than $25,500,000 were sent to Asia, $17,500,000 by the Cape of Good Hope, $1,000,000 by the Levant, and $4,000,000 through the Russian frontier. Probably, however, this estimate was a good deal beyond the mark. "Humboldt, cela n'est plus douteux, estimait trop haut la valeur de l'or et de l'argent, qui s'écoulaient au commencement de ce siècle d'Europe en Asie, et portaient trop bas la déperdition qu'ils éprouvaient, dans la même temps, par le frottement et leur conversion en objets d'orfevrerie et de bijouterie."—*Dupuynode de la Monnaie*, etc., i. p. 35. There is no longer, we believe, any doubt in regard to the accuracy of the latter part of this statement; and it is pretty generally supposed that the first part is also well founded. But some years ago this immense drain began to diminish, and in 1832 and 1833 it actually set in an opposite direction. Since then it has fluctuated, sometimes inclining to the one side, and sometimes to the other. With the exception, however, of the bullion received by England in payment of the $21,000,000 due by China, under the treaty of 1842, there was not for some years any very decided movement of bullion from Europe to the East, or from the East to Europe, though, on the whole, the imports into the latter appear to have exceeded the exports; at least, this was certainly the case during the five years from 1844–'45 to 1848–'49, both inclusive. But very recently, or within the last four years (1850–'53) the drain for bullion for the East has set in with renewed force; so much so, that in 1852 no fewer than 12,655,393 oz. silver were shipped from the United Kingdom for India and Egypt.

This continued process of export of gold and silver is attributed by some writers to the excessive use of paper money, whereby the latter supersedes in commercial channels the use of the former. "There can be no doubt that the ultimate effect of a purely specie currency (or a paper currency based entirely on specie) would be in the highest degree beneficial to all departments of industry and enterprise. It is a currency that can not fluctuate. It may expand with the increased quantity of the precious metals, but there is hardly a possibility of its contracting; and its expansion must take place by the operation of causes which operate equally throughout the civilized world."—*North American Review*, January, 1858.

The following table shows the export of coin and bullion from Great Britain to the East during each of the 10 years ending with 1852.

AN ACCOUNT OF THE QUANTITIES OF GOLD AND SILVER, RESPECTIVELY, EXPORTED TO INDIA, CHINA, AND EGYPT, FROM GREAT BRITAIN, DURING EACH OF THE TEN YEARS ENDING WITH 1852, DISTINGUISHING BETWEEN BRITISH AND FOREIGN COIN, AND BETWEEN COIN AND BULLION.

AUTHORITIES.—* BLODGET. † GALLATIN. ‡ *Congressional Reports.* § *Treasury Report.* ‖ WOODBURY. ¶ HAZARD, *Commercial Register.* ** GOUGE, *Journal of Banking.* †† HUNT, *Merchants' Magazine.* ‡‡ Estimates.

The amounts of specie in the banks and of bank-notes in circulation from 1835 to 1855, inclusive, have been taken from the annual treasury reports on the condition of the banks. The amount of specie supposed to be in circulation in different years is according to the authorities quoted. The estimates are from Doc. 34 (p. 280), appended to the Report on Finances of December 4, 1854, except that for 1855, which has been completed from data more lately received.

AMOUNT OF COINAGE OF GOLD AND SILVER BY THE UNITED STATES MINT.

		Amount.
From January 1, 1794		
to December 31,	1830	$37,096,112 90
	1831	3,889,570 00
	1832	3,577,425 00

	1850	33,847,838 50
	1851	63,388,883 50
	1852	57,845,597 50
	1853	64,291,477 94
	1854	60,713,865 47
	1855	44,000,302 93
	1856	52,479,116 40
	Total	$537,537,066 64

We give annexed a statement showing the movement of specie from the United States since the year 1820; also the amount that goes to England. It should be noticed that we do not send our specie to England to pay debts to that country, for the balance of trade between the two countries from 1820 to 1856 was $5,000,000 in favor of the United States. We send through England specie to pay our excessive importations of foreign manufactured goods from the Continent, and to pay for teas and other foreign productions. The aggregate loss of specie to this country in the decades since 1820 has been as follows:

	Gain.	Loss.
From the year 1820 to 1830		$2,528,849
" " " 1830 " 1840	$50,029,408	
" " " 1840 " 1850		21,893,285
" " " 1850 " 1856		213,122,045
		$237,543,129
Deduct gain from 1830 to 1840		50,029,408
Aggregate loss		$186,915,726

STATEMENT SHOWING THE EXPORTS FROM AND IMPORTS INTO OF SPECIE FROM THE UNITED STATES (DISTINGUISHING THE EXPORTS TO AND IMPORTS FROM ENGLAND) FROM OCTOBER 1, 1820 TO JULY 1, 1857.

Year ending	Exports to England.	Imports from England.	Total Exports from the U. S.	Total Imports into the U. S.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Burying of Gold and Silver.—It is singular that, in estimating the consumption of gold and silver, Jacob did not make any allusion to the practice which has uniformly prevailed in all countries harassed by intestine commotions, or exposed to foreign invasion, of burying treasure in the earth. Of the hoards so deposited, a very considerable portion has been altogether lost; and there can be no doubt that this has been one of the principal means by which the stock of the precious metals has been kept down to its present level. Every one is aware that during the Middle Ages *treasure-trove*, or money dug from the ground by chance finders, belonged to the Crown, and formed no inconsiderable part of the royal revenue of England and other countries. The practice has always prevailed in Turkey, Persia, India, China, and generally in all parts of the East. The extortion practiced on the inhabitants, and the want of all security, make them look upon the money they have hidden as their only wealth, the only thing which they can really call their own. "In India," says Mr. Luke Scrafton, "the Hindoos bury their money under ground, often with such secrecy as not to trust their own children with the knowledge of it; and it is amazing what they will suffer rather than betray it. When their tyrants have tried all manner of corporal punishments on them, they threaten to defile them; but even that often fails; for, resentment prevailing over the love of life, they frequently rip up their bowels, or poison themselves, and carry the secret to their graves. And the sums lost in this manner in some measure account why the silver of India does not appear to increase, though there are such quantities continually coming into it, and none going out."—*On the Government of Hindostan*, p. 16, etc.; see also BERNIER, *Voyage de Mogol*, Amsterdam, 1710, I. p. 209.

The comparative security now enjoyed by the Hindoos must latterly have lessened this practice. But a habit so prevalent and so deeply rooted is not easily eradicated; and though the illegal exactions of their rulers be curbed or put an end to, there is in many parts of India a great deal of robbery and insecurity. At all events, the practice of burying treasure is still very general in it; and at this moment it prevails to a great extent throughout all the vast countries which stretch from the Adriatic to the Chinese Sea. We have been assured by persons well qualified to form an opinion that the stimulus given to the burying of treasure by the intestine commotions now prevalent in China must have already occasioned the disappearance of full 20 or 25 millions sterling! And the previous statements confirm in some measure this estimate. But we must not imagine that the burying of treasure is confined to the East. Wherever property is insecure, it is invariably resorted to. Wakefield tells us that it used to be common in Ireland (*Account of Ireland*, i. 593); and we are informed that it continues to this day to be pretty prevalent in that country. It has always been acted on to a considerable extent in Russia, Germany, Italy, and France; and in the latter, during the revolutionary anarchy, immense sums were buried, of which it is abundantly certain a large proportion will never be resuscitated. The wars and convulsions by which Europe was desolated for more than 20 years made the practice be carried to a great height in all parts of the Continent, and withdrew in this way from circulation a very considerable part of the increased produce of the mines.—STORCH, *Economie Politique*, i. 221, Paris, 1823. And large sums are still, no doubt, disposed of in the same way.

General Remarks.—These statements, how imperfect soever, are sufficient to show that the field over which the precious metals are spread is so immense, and the demand for them so great and various, and so likely to increase, that it is not easy to imagine that their value can be speedily reduced, at least in any sensible degree. Nevertheless, if we be warranted in estimating as above the present supply at $235,000,000 a year, and their consumption (including an allowance for the increasing stock of coin) at $141,500,000 a year, it would be idle to suppose that this excess of $93,500,000 beyond the existing demand should be speedily balanced, or that it should not in the end occasion a serious decline in their value. But much, or rather every thing, will depend on the continuance of the supply; and here we have nothing to go upon but the merest conjecture. The probability, indeed, would seem to be that the supply both from California and Australia will increase for some considerable time to come. Vast, however, as is the area over which the gold deposits are scattered in these countries, still there can be little or no doubt that they will gradually be exhausted. The population attracted to the "diggings" is already so great, while (in Australia, at all events) it is increasing so rapidly, and is so thoroughly imbued with the *auri sacra fames*, that it bids fair in no very long time to rifle all the richest beds. And supposing that they are either wholly, or to a considerable degree, exhausted it may be doubtful whether the gold obtained by a more laborious search, or by crushing quartz rocks, will yield more than a reasonable profit on the capital employed, if so much.

In all speculations in regard to the probable future supply of gold it should be carefully borne in mind that any considerable fall in its value would unavoidably check its production, and, consequently, tend to lessen or prevent its further fall. It is plain, for example, that a decline of 10 per cent. in the value of gold would, *ceteris paribus*, occasion the abandonment of all those mines, diggings, washings, etc., which only yield a net profit of that amount. We are aware that,

owing to the production of gold, as at present carried on, having more of a gambling character than pertains to most branches of industry, the principle now stated would not operate so speedily as might perhaps be anticipated. But of its ultimate operation there can be no question. And it may, therefore, be laid down that any reduction in the value of gold which is not accompanied by a corresponding improvement in the methods of its production inevitably tends to correct itself, or to check or hinder its further reduction. It is idle, therefore, where so much is uncertain, and indeed altogether unknown, to attempt to draw any conclusions entitled to much attention with respect to the probable future supply of the precious metals. But supposing it to go on for a few years as at present, or not materially to decline, and that their value is in consequence gradually reduced, there is no good ground for apprehending that this reduction will have any injurious results. If it take place, it will be slow, and will not suddenly affect the incomes or the position of individuals. And we have elsewhere endeavored to show that the changes which, under these conditions, may be ultimately effected by a decline in the value of bullion, will, in a national point of view, be eminently desirable and beneficial.—*Treatise on Taxation*, 2d ed., p. 375–387; see also an able article in the *American Review* for October, 1852. We have seen nothing to induce us to change or modify in any degree this opinion. Some stress has been laid on the circumstance of the sums payable under life insurances falling in value with a decrease in the value of money. But the great majority of people are, and all may be, insured in mutual insurance offices, and may provide by proper investments against loss. No fall within the compass of probability is likely seriously to affect the existing race of annuitants. And those who are now buying annuities know what they may expect, and their heirs will have them only to blame if they do not guard against probable contingencies.

Substitution of Gold for Silver.—The production of gold has very largely increased since 1848, as compared with that of silver; and if this state of things go on, the value of silver, measured in gold, can hardly fail gradually to rise. But it is by no means clear that it will go on. The supplies of silver are increasing in most parts of the world, particularly in Mexico and Europe. And the increased supplies of quicksilver obtained from California and other places will powerfully contribute still further to augment the supplies of silver. It is also to be observed that a comparatively inconsiderable rise in the value of silver as compared with gold is sufficient, unless prevented by legislative enactments, to make the latter be used in preference to the former in the currency of those countries in which both metals are legal tender. Hitherto both gold and silver coins have been legal tender in the United States, France, and some other countries. But when such is the case the value of the coins in respect to each other has to be fixed by authority, that is, it has to be enacted that debts may be discharged by payments either of gold or silver money at the rate of so many dollars to the eagle, francs to the Napoleon d'or, shillings to the sovereign, and so on, as laid down in the Mint valuations of the different countries. And we have already explained (*art.* Coins) that, however correct at the periods when they are made, these valuations speedily become incorrect; and that whenever such is the case, it is for every body's advantage to make all payments in the metal which happens to be overvalued as compared with the other. And hence (as seen in the article referred to) the use of gold as money in preference to silver in England, and of silver in preference to gold in France and the United States.

In accordance with these statements, it would seem that the change which has taken place in the relative values of gold and silver, though not very appreciable, is quite enough to make the former be employed instead of the latter in all countries where they are equally legal tender. In 1849, for example, the gold coined in France amounted to only 27,109,560 francs, whereas in 1851 it amounted to 285,237,280 francs! In the United States the coinage of gold has increased in a somewhat similar ratio, having risen from $9,007,761 in 1849 to $62,614,492 in 1851, and to $52,846,187 in 1852. There is, therefore, every probability that in no long time gold coin will be used in these two countries in all considerable payments which are not effected by means of notes or checks. This substitution of gold for silver, while it materially enlarges the field for the employment of the former, proportionally narrows that for the employment of the latter. And hence a very considerable permanent increase may be made to the comparative supply of gold without its value, measured in silver, being materially affected. In the end, no doubt, the values of both metals will be proportioned, independently of variations of demand, to the respective costs of their production. But before this equalization can take place, they must be distributed among the various countries of the world according to the circumstances peculiar to each, including therein the novel conditions of their supply.

In Holland and India that substitution of gold for silver coin, which is taking place in the United States and France, has been hindered by the intervention of government, which has declared that silver only shall be legal tender. In Holland this was effected by laws passed in 1847 and 1849, and in India by enactments in 1835 and 1852. The value of the gold coin that was consequently liberated in Holland has been estimated at about 172,000,000 florins, a considerable portion of which has been absorbed in the new gold currency of France. We may add that the additional quantity of silver required through the cessation of gold as currency for the supply of the Dutch mints, slightly affected the price of the former, which afterward fell to nearly its old level.

In India, where wages have always been very low, the great bulk of the coin in circulation has consisted of silver; and in 1835 it was made the only legal tender. But though not legal tender, gold coins continued to circulate in India; and a proclamation issued in 1841 directed them to be received at the public treasuries. Little attention was paid to this measure at the time; but after the discovery of the gold deposits in Australia, it became obvious, if gold coins continued to be received by the public departments, that eventually none else would be paid into them; and that silver would cease to be employed except in petty payments. This contingency appears to have alarmed the government; and notice was accordingly given on the 22d of December, 1852, that from and after the 1st of January next (1853) gold coins would not be received on account of taxes or other payments due to the public. Silver has, consequently, again become in fact, as well as in law, the sole legal tender of India. A good deal of controversy has taken place in regard to this measure. It is plain, however, that by continuing to act on the proclamation of 1841, government would have practically set aside the law of 1835, which made silver the only legal tender; and would thus have made itself responsible for all the losses that might in consequence have resulted to individuals, while it would also have become liable to the risk of having its own revenues reduced by the anticipated fall in the value of gold. No doubt, therefore, the repeal of the proclamation referred to was consistent with good faith, and in some degree also with sound policy. At the same time, we regret that the situation of affairs in India should have been such as to require that an attempt should be made to exclude gold from the circulation. Most likely it would otherwise have absorbed considerable supplies of that metal; and we incline to think, for the reasons previously stated, that it will do so, notwithstanding its exclusion from the public treas-

United States imported thence produce to the value of $920. In 1833 it amounted to $1094; in 1837 to $6601; in 1840 to $16,293; and in 1841 to $47,630. The tonnage employed was, in 1835, 682 tons; in 1836, 1418 tons; in 1837, 1574 tons; in 1841, 1943 tons; in 1842, 1309 tons; in 1843, 1813 tons; and in 1844, 3217 tons—all American.

It is only within a few years, however, that the trade of the Sandwich Islands with the United States has assumed any considerable importance. The great wealth and rapidly increasing trade of California, together with the facilities which this group, from its geographical position, has always, as already intimated, been enabled to afford to whaling ships, both as a recruiting station and as regards the general supplies which such vessels require during their long cruises in distant latitudes, have recently given to these islands a commercial importance which, under other circumstances, might not have been reached for a century to come. The staples of the island have now a market in California, close at hand, and the communications with the Atlantic coast have become regular and frequent.

Owing to the prevalence of the small-pox, which first made its appearance in the month of May, 1853, and spread with such fatal malignity throughout the group as to carry off nearly 8000 victims, the trade of that year was languid; the markets were overstocked, and prices were, consequently, low and unremunerative.

The retail trade, especially, shared in this general stagnation. The whaling fleet of 1853 was about equal to that of 1852, though, generally, the results of the latter year were not equal to those of the former. The average catch of the Ochotsk fleet was over 1600 barrels, while in the Arctic seas the yield did not average more than 580 barrels. Freights also ruled low, and the demands for the productions of the islands for the markets of California were small, owing chiefly to the fact that the almost nominal difference in prices between the two places precluded all hope of realizing any profits after the payment of duties.

The following summary of the recent commerce of the Sandwich Islands has been compiled from the latest and most authentic sources:

The total amount of imports for 1853 exceeded those of 1852 by $522,082 64. From the United States they amounted to $954,919 98, being more than three-fourths of the whole amount imported. The imports for four years, from 1850 to 1853, both inclusive, were as follows:

1850	$1,085,058 70
1851	1,823,821 68
1852	759,868 54
1853	1,231,951 18

Giving an average for the four years of $1,225,175 02.

The amount of imports for 1853 exceeded the average of the past four years by $56,776 16.

COMPARISON FOR FOUR YEARS.

Foreign Exports.

1850	$46,529 72
1851	381,402 55
1852	381,143 51

The total number of vessels of war at Honolulu during 1854 was 25, carrying an aggregate of 675 guns; of which number 6 were American, 9 British, and 7 French.

Of merchant vessels at the Hawaiian Islands during the year 1854, the total number was 148, measuring in the aggregate 47,288 tons; of which there were,

American, 103—measuring	33,442 tons.
British, 17— "	4,788 "

The total number of whaling vessels at the ports of the Hawaiian Islands during 1854 was 565; of which there were American 534, Bremen 8, and French 22.

The returns from the port of Hilo for the year 1854 exhibit the following commercial movement:

Total value of imports	$11,491 53
Value of exports, domestic produce	$3,328 31
Furnished as supplies &c. 89 whalers at an overcharge of $2 25 each	18,450 00
	22,273 31

The transhipments from the port of Hilo during the year were as follows:

Sperm oil	20,806 gallons.
Whale oil	114,263 "
Whalebone	92,974 pounds.

Whaling vessels at the port of Hilo in 1854:

American, 80 vessels—measuring	29,898 tons.
French, 2 " "	1,014 "
Total.. 82 " "	30,912 "

The following condensed tabular statement, made up from reliable sources, exhibits the general trade of the Sandwich Islands from 1852 to 1855, distinguishing imports from the United States from those from other countries:

Years.	Value of Imports.		Value of Exports.
	From all Countries.	From United States.	
1852	$793,869	$411,488	$688,895
1853	1,281,951	954,919	466,772
1854	1,316,787	1,028,851	585,123
1855	1,806,356	793,574	572,602
Annual average	$1,186,241	$797,458	$565,723

According to the returns made to the United States Treasury Department, the total value of exports to the Sandwich Islands for the year ending June 30, 1855, was $1,125,622, of which $929,671 was for domestic products, and only $195,951 for foreign products. From the same authority it appears that the imports into the United States from the Sandwich Islands for the same year amounted to $442,399. The carrying trade between the two countries is almost exclusively in the hands of American shippers. Of the total exports of domestic produce as given above ($929,671), there was borne in United States bottoms $928,458, while there was only $1213 carried under all foreign flags. Of the total tonnage that entered the United States from these islands in 1855 (25,009 tons), 24,807 were under the flag of the United States. More than three-fourths of the exports of the Sandwich Islands go to the United States, either on the Atlantic or Pacific side, and the statements already given show the proportion of the imports into the islands from the United States. Of the 468 whalers that touched at the islands in 1855, 436 bore the flag of the United States, 20 were French, and 8 Hawaiian. Of the 158 merchant vessels that entered the Hawaiian ports the same year, 129 were American, while there were only 8 under the British, and 1 under the French flag. Among the latest acts passed by the Hawaiian Legislature relating to commerce, which has been published in the official organ of that government, is one prohibiting the importation and sale of opium.

A considerable trade has sprung up between Washington Territory and the Sandwich Islands. Four vessels have been for some time regularly and constantly engaged in this trade, carrying (especially from Oahu) sugar, coffee, molasses, salt products of the islands, as well as foreign merchandise from the different warehouses; and bringing back, in return, lumber, shingles, ship-timber, spars, salmon, coals, etc. This trade has had the effect of entirely driving from the market the traffic previously carried on by the Hudson Bay Company between Honolulu and Vancouver's Island; "for, although," says a recent British official report on the Sandwich Islands, "Vancouver's Island possesses superior natural advantages over Washington Territory with respect to her ports and several of her productions, on the other hand, the American settlers, not being bound by any conditions that can not be easily fulfilled, their energy and private enterprise are unshackled."

A steam-mill, having two engines, one of eighty and the other of forty horse power, has been erected at the mouth of Hood's Canal, and head of the Straits of Fuca, opposite Vancouver's Island, for manufacturing lumber, shingles, laths, and planed, grooved, and tongued boards. This mill supplies the Honolulu and the San Francisco markets. Other and similar mills have been put up; and the business continues profitable, though competition is increasing. For an account of the lumber trade *via* San Francisco, *see* SAN FRANCISCO.

COMPARATIVE STATEMENT OF THE COMMERCE OF THE UNITED STATES WITH THE SANDWICH ISLANDS, EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH COUNTRY DURING THE YEARS DESIGNATED.

Years.	COMMERCE.				NAVIGATION.			
	Value of Exports.			Value of Imports	American Tonnage.		Foreign Tonnage	
	Domestic Produce.	Foreign Produce.	Total		Entered the United States.	Cleared from the United States.	Entered the United States.	Cleared from the United States.
1845	....	....	....	$1,556	....	....	....	....
1846	....	....	....	243,034	606	1,977	231	....

1848	....	....	....	6,508	1,478	479	....	....
1849	....	....	....	43,875	3,221	3,066	....	....
1850	....	....	....	64,474	9,267	31,623	4,125	11,970
1851	....	$881	$881	16,852	18,902	36,390	3,215	12,008
1852	....	....	....	5,088	12,814	18,624	5,047	6,673
1853	....	29,406	29,406	16,575	18,111	20,260	3,914	4,118
1854	....	25,831	25,831	119,130	22,287	19,825	1,451	1,417
1855	$929,671	195,951	1,125,622	442,399	24,807	19,211	202	2,200
1856	793,089	126,847	919,405	249,704	17,774	17,550	1,092	1,817
1857	803,084	144,849	947,433	204,416	16,742	16,951	187	187

The proportion which the United States had in the total trade of the islands in 1856 is shown by the following:

	Exports.	Imports.	Total.
Total trade	$670,824	$1,151,422	$1,822,246
With the United States	249,704	919,406	1,169,110

From this exhibit we find that in 1856, 80 per cent. of the imports into the Sandwich Islands were from the United States, and that 37 per cent. of the exports were to the United States. The balance of trade in favor of the United States for the same year was $669,700.

On the whole, the statistics published for 1856 show the trade of the islands in a more favorable and healthy condition than those of any previous year since 1850. The number of merchant and whaling vessels visiting the islands during the year has been less, and the importations into the islands were $230,000 less, while the exports show an increase of about $100,000 for the year.

According to the tables published by the Collector General, the importations during 1856 are shown to be $1,151,422; the exports at only half that amount, or $583,544, omitting the sum of $87,280, which is stated to be the produce of vessels bearing the Hawaiian flag. The total exports appear as $670,824.

In estimating the "supplies" furnished to whale ships for the year 1855, it is estimated that each whale ship took, on an average, $275 worth of supplies, or island produce.

In examining the table of domestic exports, it will be observed that the exportation of staple products has not increased rapidly, though the sum total of domestics exported in 1856 is much in advance of previous years, excepting only the "potato year," 1850, which apparent increase is owing somewhat to the different estimates of the supplies furnished to whale ships. We give a comparison of some of our staple exports for four years:

Exports.	1848.	1849.	1855.	1856.
Gals. of molasses and sirup	28,978	41,235	38,804	58,802
Pounds of sugar	499,533	658,820	289,908	554,805
" coffee	58,065	28,221	77,616	68,532
Oranges	....	50,000	25,000	175,000
Goat skins	....	21,488	103,700	70,914

The domestic consumption of sugar as well as coffee

in the Islands has been greater during the past than in former years. It is supposed that the amount of sugar produced the past year is at least 500 tons, about one half of which has been exported. Of coffee the produce has been not less than 300,000 lbs. Only a small portion appears above as having been exported. But of both sugar and coffee the whaling fleet will yearly require larger supplies, as they leave home with smaller stocks, owing to the high rates these articles command in the States.

The receipts at the customs for 1856 show a falling off of about $35,000 from those of 1855, which is accounted for in part by the decrease in the importation of goods ($280,000) and spirits (3600 galls.), and these items show about the same falling off as the number of whaling and merchant vessels visiting the group.

COMPARATIVE VIEW OF THE COMMERCE OF THE SANDWICH ISLANDS FOR TEN YEARS, FROM THE YEAR 1847 TO THE YEAR 1856, GIVING THE TOTALS FOR EACH YEAR.

* These figures give the number of different *entries* of whalers at the various ports—some of the vessels entering at three, four, and even five ports during the year. The actual number of different whalers during 1856 will not exceed 240.

Ports of Entry.—The following are the only ports of entry in the Sandwich Islands, viz.: for vessels of all descriptions, Honolulu (Oahu), Lahaina (Maui), Hilo, Kealakeakua, and Kawaihae (Hawaii), and Waimea (Kauai); and for whalers, and vessels of war only, Hanalei (Kauai).

Port Charges on Merchant Vessels.—At Honolulu.—Tonnage dues, fifteen cents per ton register; pilotage, one dollar per foot each way; or half-pilotage if no pilot is employed; health certificate, one dollar; buoys, two dollars; harbor-master, three dollars; clearance, one dollar; pilot for anchoring a vessel outside which does not enter the harbor, ten dollars.

At Lahaina.—Tonnage dues the same as at Honolulu; boarding officers, five dollars; lights, one dollar; canal, if used, two dollars; clearance, one dollar.

At Hilo.—Tonnage dues, pilotage, health certificate, and clearance, the same as at Honolulu.

At Kealakeakua.—Tonnage dues the same as at Honolulu; boarding officer, five dollars; clearance, one dollar.

At Kawaihae (Hawaii), and Waimea (Kauai), the same as at Kealakeakua. Any vessel, having paid the tonnage dues at one port, complied with all the port regulations, and obtained a clearance from the collector, may go to either or all of the other ports of entry, without paying any additional tonnage dues during the same voyage.

Privileges to Whale Ships.—Whale ships are allowed to land goods to the value of $200 free of duty, and $1000 worth additional, subject to a duty of 5 per cent. *ad valorem*, without being liable to pay any tonnage dues; but if they land more than $1200 worth (including the $200 worth free of duty), they are subject to the same charges and liabilities as merchant vessels.—*See* WHALE FISHERIES.

Penalties, Restrictions, etc.—Any master of a whale ship who shall fail to produce his permit when called for is liable to a fine of not less than $10, or more than $50, to be imposed by the collector. Any vessel having cargo on board intended for a foreign port, or spirits in cargo or stores, and touching at a place not a port of entry, without a permit from a collector, is liable to pay double tonnage dues. Oil, whalebone, or any other article of merchandise, landed or transhipped without a permit, is liable to seizure or confiscation. Seamen are not allowed to be discharged at any of the ports of these Islands, except Honolulu and Lahaina. It is not lawful to discharge seamen at any of the ports of the islands without the written consent of the governor. Honolulu and Lahaina are the only ports at which native seamen are allowed to be shipped, and at these places only with the consent of the governor.

Sandy Hook, Middletown township, Monmouth county, New Jersey, is a sandy beach extending north from Old Shrewsbury Inlet and the south point of the Highlands of Navesink, five miles, and is from half a mile to a mile wide. It incloses Sandy Hook Bay. The lights are on the north part. The Sandy Hook lights consist of the main light, and two beacons placed in position, for ranges of channels. The main light is in lat. 46° 27′ 42″ N., long. 73° 59′ 48″ W. from Greenwich, England.

Light-ship.—A light-ship, painted red, of about 350 tons burden, and showing two lights, is anchored off Sandy Hook. The forward light is 30 feet above the deck, and the after one 40 feet. She is also provided with a bell of 800 pounds weight, which will be rung in thick weather. She is placed in 13 fathoms water. Sandy Hook light-house bears from the light-ship west by north, distant 6¼ miles; Highland light-house, west-southwest, distant 7 miles.

Highlands of Navesink.—Navesink hills, on which two light-houses are built, extend northwest and southeast, about southwest from Sandy Hook, on the Atlantic Ocean to Raritan Bay. The correct altitudes of the following places, which present themselves to mariners as they approach them, are: Mount Mitchell, the highest point of Navesink, Monmouth county, New Jersey, 282 feet; Tompkins' Hill, on Staten Island, 307 feet; Hempstead Hill, Queen's county, Long Island, 319 feet.

Highland Lights.—On the Highlands of Navesink there are two light-houses bearing north 23° W., and south 23° E., from each other distant 100 yards. The southern light is a revolving one, on the Presnel plan; it is 248 feet above the level of the sea. The northern light is a fixed light, 246 feet 7 inches above the sea.

Ledge South Sandy Hook.—On this reef there are but 9 feet of water. The northern light on the Highlands, a little open to the eastward of the southern one, leads right on the reef. This ledge is south half east from Sandy Hook light, 7 miles distant, and about 1¼ mile from the shore, and on which the ship *William Thompson* struck.

Oil Spot.—East-southeast 1¼ mile from Sandy Hook light is the Oil Spot, having only 10 feet of water in one spot at low water. It is of a triangular shape, and about half a mile on each side in extent. The along-shore channel is inside of it.

False Hook.—1¼ mile east, a little northerly, from Sandy Hook light, there is a small shoal spot, with only 12 feet water upon it at low water. It is the remains of the old False Hook.

New York Harbor.—There are four channels over New York bar. The first is that along and parallel to the Jersey shore, inside of the Outer Middle. The second is the South Channel, between the Black Can Buoy, No. 1, and the Red Can Buoy, No. 2. The third is the Main Ship-channel, between the Red Can Buoy, No. 2, and the Black Nun Buoy, No. 1. The fourth is Gedney's Channel, between the Black Nun Buoy, No. 1, and the Red Nun Buoy, No. 2. This channel runs west by north, and is used by our largest class ships of war.—BLUNT'S *Coast Pilot.*

During the year 1857 the west beacon at Sandy Hook, the foundation of which had been undermined by the sea, was removed to a secure position by order of the Light-house Board, a new screen erected, and the main light-house fitted with a new lantern and a third order lens. Gedney's Channel into New York Bay having two feet more water than the old channels, was unknown until a few years since. The knowledge of this channel is owing to the operations of the Coast Survey. Had the true depth of this channel been known in 1778, the French fleet under Count D'Estaing would have passed into the bay and taken the assembled British naval force.—*Coast Survey Report*, 1854; *Light-house Report*, 1857.

San Francisco, a city and sea-port of the United States, in California, on the south promontory, dividing the great bay of San Francisco from the Pacific, inside the bay, and a short way to the south of its entrance. The latter, now called the Golden Gate, little more than a mile in width, has on its south side an old Spanish fort, or *presidio*, in lat. 37° 48′ 30″ N., long. 122° 27′ 23″ W. Having passed the fort, the course to the town is nearly east from three to four miles, and then south and west about as much more. The city is situated at the bottom of a bay, skirted by extensive flats, some of which are now being formed into docks. Its growth has been quite extraordinary. In the early part of 1848 it consisted only of a few rude cabins; whereas it has now an exchange, a theatre, a custom-house, sundry churches and other public buildings, with great numbers of private houses, many of which are of wood, but many also of *adobe* (sun-dried) and burned bricks, with a vast number of attached tents and booths. And while such is the metamorphosis on shore, her waters, which were formerly quite deserted, are crowded with ships and steamers from all parts of the world! San Francisco is indebted, as every one knows, for this all but miraculous transformation to the discovery of gold deposits in the beds of the tributaries of the San Joaquin and Sacramento rivers, which fall into her bay, and in the quartz of the contiguous mountains. Such, however, are the advantages of her situation, and the fertility of the adjacent country, that the exhaustion of the gold deposits, though it might check for a while, would not permanently affect the growth of the city, or the extent of her trade. To obviate the shallowness of the water close to the town, a wharf 2300 feet in length has already been projected into the bay, and to it all sorts of vessels are safely moored. The construction of extensive docks has also been commenced; and every effort is being made to provide the accommodation necessary for the rapidly increasing trade of the town.

San Francisco stands on a sandy level; and during the wet season, when it is most crowded, the streets were at first mere puddles, into which carriages sunk to the axles; while in the dry season the annoyance from dust was all but intolerable. But these inconveniences have been to a great extent obviated by flooring the streets, or covering them with stout planks, a process which has been carried to a great extent, and has had the most complete success The city has suffered much from fires, by which, indeed, it has repeatedly been laid waste. These, however, have been speedily repaired; and in a few weeks no traces are seen of the most destructive conflagrations. According, however, as houses of brick or stone are substituted for those of wood and for tents, fires will become less frequent and less destructive.

The population of San Francisco is the most motley that can be imagined; for, though Americans predominate, a large admixture is to be seen of adventurers from all parts of the world. Gambling is very prevalent; and is, perhaps, carried on to a greater extent here, during the rainy season, than in any other place either of the New or the Old World. But this is the natural result of the circumstances under which the population has been brought together; and the passion will no doubt abate as the circumstances in which it originated change or lose their influence. Lynch-law has been here reduced to a system, and carried to a greater extent than any where else; and, despite the gross abuses to which it unavoidably leads, it is the general opinion that it could not have been dispensed with. A sense of its necessity has led, not only to its being adopted, but to its being generally approved.

Nowhere in the world is there so great a disparity between the sexes as in San Francisco, there being at least from three to five men for one woman. But this disparity is gradually lessening, and with it some of the worst features in the present condition of the population. The population of the city differs widely at different periods, being crowded in the wet, and comparatively deserted in the dry season. Though by far the largest and most important town in the State, it is not its capital. That distinction has been conferred on San José in consequence of its more central situation.

The Bay of San Francisco, though, as already stated, it has a narrow entrance, expands within into one of the noblest basins that is any where to be met with, having a coast line of about 275 miles. The town has already become the seat of a very extensive trade, and will most likely be the grand emporium of the vast territory belonging to the United States on the Pacific. The trade with China, Australia, the Eastern Archipelago, and the Polynesian Islands, is even now very extensive, and several ships have been fitted out for the whale-fishery. At present, however, the principal trade of the city is with Panama on the one hand, and Oregon on the other; bringing immigrants and all sorts of manufactured goods from the former, and corn and other raw produce from the latter. But she has also an extensive trade with Chili, the eastern portion of the United States, and with Europe by Cape Horn. The importation of many sorts of products has been completely overdone, and some varieties of manufactured goods might, in 1853 and 1854, be bought in San Francisco as cheap as in Liverpool or Havre. This, however, is a species of miscalculation incident to the opening of all new markets, and will speedily correct itself. Gold bullion, with small but increasing quantities of quicksilver, and hides, have hitherto been the all but exclusive articles of export.

The subjoined tabular form gives at a comprehensive glance the amounts of the assessment, together with the rates of taxation of the city and county of San Francisco, for eight fiscal years, since the first organization of the local government, viz.:

Fiscal Years.	Rate of Taxation per Cent.	Amount of Assessments.			
		Real Estate.	Improvements.	Personal Property.	Yearly Total.
	Dls. Cts.	Dollars.	Dollars.	Dollars.	Dollars

RECAPITULATION, YEAR 1856.

	Men	Women.	Children	Total
Total arrivals	20,940	5244	2081	28,265
Total departures	20,909	1348	646	22,903
Excess of arrivals	31	3896	1435	5,362

Showing a net gain of population from arrivals by sea, during the year 1856, of 5362 souls. This is a very unfavorable exhibit, and we regret to make it public. During the last six months of the year the departures were 927 souls in excess of the arrivals. It is, however, the class of population that we are losing which is the worst feature. During the last half of 1856, the departures of male adults for the Atlantic States were 2534 in excess of the arrivals.

The population has received a strong reinforcement during the past year by immigration over the plains. Early in the season exaggerated estimates were made of the extent of this immigration, as well as of the quantity of stock that would be driven over; but we do not overestimate the number when we say that fully 8000 persons were added to the permanent population of the State by the overland route during the past year, and that they brought with them 25,000 to 30,000 head of horned cattle. This is the character of population that the State needs, and if Congress would authorize the construction of a wagon road over the plains, we should see 50,000 people annually leaving the Valley of the Mississippi to make their homes on the Pacific slope of the Rocky Mountains. As matters are now, with virtually but one line of communication with the Atlantic coast, we need indulge in no brilliant hopes of the advancement of California in population of the right stamp.—*San Francisco Price Current.*

Since the preceding was written, Congress passed an act under date February 17, 1857, entitled "An Act for the construction of a wagon road from Fort Kearney, via the South Pass of the Rocky Mountains and Great Salt Lake Valley, to the eastern portion of the State of California;" 2. For a road from El Paso, on the Rio Grande, to Fort Yuma, at the mouth of the Gila; 3. For a road from Fort Defiance, in New Mexico, to the Colorado.

The following table will show the excess of arrivals over departures, and also those which have gained during the year 1856, together with the amounts of our gain and loss:

Of the annual product of the gold mines and placers of the State, it is difficult, also, to speak with any positive degree of accuracy. In the fire of May, 1851, almost the entire records of the custom-house were destroyed, together with a vast quantity of the books and papers of mercantile houses, so that we can only state

the recorded amounts exported by the mail steamers and other vessels since that epoch, which were as follows, according to official data:

ESTIMATED PRODUCE OF THE MINES OF CALIFORNIA SINCE THEIR DISCOVERY.

Previously to 1851, assumed from statistics of the United States Mint	$63,915,000
1851	45,989,000
1852	45,779,000
1853	54,965,000
1854	51,429,000
1855	45,183,000
1856	50,607,000
1857	50,043,000
Add probable amount in hands of passengers, 6 years, $10,000,000 per annum	60,000,000
Total	$468,000,000

In the foregoing estimate no account is taken of the amount of uncoined gold in the hands of miners, or lying on general deposit with the various express agents and bankers It is the opinion of those who have made inquiries on the subject, that the amount thus retained in the country is fully up to three millions of dollars. Nor is the amount shipped by sailing vessels included, an omission caused by our inability to ascertain the proportion which dust bears to coin in such shipments. The shipments of treasure to China, Manilla, Calcutta, Valparaiso, and Honolulu, the present year, amount to about $853,000.

It would be a difficult task to ascertain the total value of foreign goods imported and consumed in this region, as a great part are previously imported at the eastward, and do not require to be specifically entered in our custom-house. In stating, therefore, the amount of our direct importation of foreign goods, for the year ending the 1st of October last, at $7,490,000, we merely do so *en passant*, without reference to the actual consumption. If we were to form an opinion of our imports from the amount of our annual exports, both of produce and gold, we should say that the former would amount to at least $36,000,000, which forms nearly the whole basis of our trade.

The following is a comparative statement of the exports from San Francisco for the years 1855 and 1856:

	1855.	1856.
Treasure	$45,182,631	$50,097,434
Foreign merchandise, produce, and quicksilver	4,189,611	4,270,515
Total	$49,372,242	$54,367,949

In estimating, as we have done, the imports at only $36,000,000, or two-thirds the amount of our exportations, we presume the remaining $18,000,000 to have been absorbed by the rents and other revenues of absentees; by the interest on foreign capital; and by the remittances of miners and others to their absent families, as well as those of others whose entire earnings are sent out of the country. These are mere speculative views and opinions, but, in the absence of positive data, they may not be deemed unworthy of application.—*San Francisco Price Current.*

VALUE OF EXPORTS OTHER THAN TREASURE FROM SAN FRANCISCO DURING THE YEAR ENDING DECEMBER 31, 1856.

Australia	$1,123,367

Total	1283	445,867

RECAPITULATION FOR THE YEAR 1856.

	Vessels.	Tons.
American vessels departed for domestic ports	866	143,181
" " " foreign ports	288	254,771
" " " whaling voyages	18	3,855
Foreign vessels departed for domestic ports	1	211
" " " foreign ports	115	42,788
Total	1283	445,867

The tonnage arriving during the three years below stated was as follows:

	Vessels.	Tons.
Arrived in 1853	28	558,755
" 1854	620	406,114
" 1855	824	412,086

The tonnage entering from eastern domestic ports in 1853 was 260,045 tons; in 1854 it was 153,313 tons; and in 1855, 144,434 tons. The arrivals of the past year from New York are in the proportion of two tons to one from Boston, the actual figures being 89,951 tons from New York against 45,601 tons from Boston.

The tonnage from all quarters arriving in San Francisco in 1856 comprised 1455 vessels of 440,015 tons against 1520 vessels of 517,919 tons in 1855. The decrease has been in domestic coast and foreign trade, the tonnage entered from domestic Atlantic ports being somewhat larger than in 1855. The following figures illustrate this:

Arrived.	From domestic Atlantic Ports.	From domestic Pacific Ports	From foreign Ports.
	Tons.	Tons.	Tons.
1855	147,870	189,635	117,092
1856	149,370	138,149	149,617
Increase in 1856	1,500	....	....
Decrease in 1856	....	51,486	27,475

The tonnage entered from domestic Atlantic ports in 1853 was 260,045 tons; in 1854, 153,313 tons, in 1855, 147,870 tons; and in 1856, 149,370 tons. Thus it appears that the imports from that quarter have hardly decreased since 1854. The great falling off in trade is more apparent than real, as in the tonnage entering in 1855 were included the ocean steamers arriving from Benicia, and in the table of 1856 they are excluded. Undoubtedly, however, the coasting trade has fallen off 20,000 to 30,000 tons, compared with 1855, which is owing to the decreased shipments of lumber from the North.

The imports this past year from Great Britain exhibit a falling off of near 60 per cent. compared with those of 1854. The tonnage entered for four years past was as follows:

1853	35,324 tons.	1855	26,608 tons.
1854	32,111 "	1856	11,729 "

From the continent of Europe there entered in 1855, 13,242 tons against 10,434 tons in 1856.

With China the trade shows a considerable increase—the tonnage entered in 1856 being 27,110 tons against 17,296 tons in 1855. The clearances to that country have little connection with trade, and therefore there is no need of making comparisons with previous years.

The exports have been upon a larger scale to Australia in the year 1856 than to any other country. The tonnage movement for three years was as follows:

	1854.	1855	1856.
Entered.....tons	6,854	6,460	3,375
Departed ..... "	10,902	15,719	12,558

With the Sandwich Islands the trade for the years 1854–'56 was as follows:

	1854.	1855	1856
Entered.....tons	8,497	10,361	6,698
Departed ..... "	8,065	10,948	15,555

The increase noticeable in the tonnage departing for the Islands in 1856 was caused by a larger number of clippers than usual going thither to freight oil home.

With the other Pacific Islands trade since 1854 has ranged as follows:

	1854.	1855.	1856.
Entered.....tons	2551	3261	2522
Departed ..... "	2287	2715	1971

The tonnage movement for the three following years with Mexico was as follows:

	1854.	1855	1856.
Entered.....tons	3077	5,459	5581
Departed ..... "	8065	15,870	8873

The great discrepancy between the tonnage arriving from and clearing for domestic Pacific ports needs explanation. During the last half of the year the departures of that class of tonnage in the table above comprise only the small number of vessels which it was necessary to clear at the custom-house, on account of there being foreign goods on board exceeding $400 in value. The arrivals, which are correctly stated, are the true index of the domestic coast trade.

The declared exports of treasure, however, do not by any means comprise the whole amount of the precious metals which annually leave California. Since the great bank failures in 1855, miners who are going to the East prefer carrying their money on their persons to trusting to bills of exchange. Incidents connected with the loss of the *Central America* demonstrated that her passengers had with them a very large amount of gold; and those leaving here by every steamer for Panama take away in the aggregate heavy sums, of which no account can be got. But, at a low calculation, ten millions of dollars leave the State annually in the hands of passengers by steam and sailing vessels. The entire product yearly of our gold mines can be ascertained only approximately. Persons who are qualified by position and observation to give the most correct opinion upon the subject place the amount at seventy millions, and this amount is probably rather under than over the mark.

We are gratified to state that the value of our exports other than treasure, in 1857, shows an increase, although small, over that of tho preceding year—the figures being $4,329,758 in 1857 against $4,270,515 in 1856. The great increase is in the exports to New York, which have doubled in value, and the greatest decrease to Australia, in which the falling off is $809,000.

The exports of quicksilver in 1857 were as follows:

To Mexico	flasks 14,334
To New York	" 8,374
To China	" 3,554
To Chili	" 1,000
Total	" 27,262

The exports in the four preceding years were:

In 1853.....	flasks 18,800	In 1855.....	flasks 27,165
In 1854.....	" 20,908	In 1856.....	" 28,740

Tonnage Movement of the Port of San Francisco.—The arrivals from all quarters during the years 1855–'57 have been as follows:

	Vessels.	Tons.
1855	1590	517,919
1856	1455	444,015
1857	1583	427,556

The tonnage arriving from domestic Atlantic ports during the past year exhibits a large falling off when compared with that of 1856—that from domestic coast ports an equally large increase, and that from foreign ports a falling off of about 10 per cent. compared with 1856. The following are the figures:

Arrived.	From domestic Atlantic Ports.	From domestic Coast Ports.	From foreign Ports.
Years.	Tons	Tons.	Tons.
1856	149,370	138,149	149,617
1857	109,525	169,036	184,441
Decrease in 1857..	39,845	....	15,176
Increase in 1857 ..	....	45,887	....

The tonnage from home Atlantic ports in 1853 was 260,045 tons, being more than two and a half times larger than in 1857; the arrivals of 1854, '55, and '56 averaged about 150 000 tons. From Great Britain the tonnage arriving in 1857 was 16,992 tons against 11,729 tons in 1856, exhibiting an increase of nearly 50 per cent., but a decrease compared with preceding years. From the continent of Europe there entered in 1857, 12,681 tons against 10,434 tons in 1856. With China the import trade shows a slight falling off compared with 1856, the totals being 23,824 tons against 27,110 tons. The trade with Australia, as indicated by the tonnage arriving and departing for the past four years at San Francisco, has been as follows:

	1854.	1855.	1856.	1857.
Entered.....	6,854	6,460	3,875	4,729
Departed	10,292	15,712	12,558	10,133

The arrivals from the Sandwich Islands are the best index of the direct trade with that country (a number of the clearances thence being vessels to freight oil to the Eastern States), and for the last four years have been as follows:

1854.....tons 8,427	1856.....tons 6,683
1855..... " 10,861	1857..... " 8,900

It will thus be seen that the trade with the islands since 1855 has fallen off nearly two-thirds. In like manner as with the Sandwich Islands, the arrivals from the west coast of Mexico indicate the trade proper between the two countries, and for the past four years have been as follows:

1854 .....tons 3077	1856 .....tons 5531
1855 ..... " 3459	1857 ..... " 6059

These figures indicate a healthful and gratifying increase in the trade with Mexico, which is destined in the future to become of very great importance. The tonnage movement during the past year indicates that the imports from the Eastern States and foreign countries were about 18 per cent. less than in 1856, and although making, as a general thing, a nearer approach than ever before to being adapted to the wants of the market, have yet in many important respects been of the most excessive character, and have resulted in heavy losses to those interested in them.

Export Trade of San Francisco.—The prominent item in exports of course is, and will continue to be for many years, the product of the mines. The exports of treasure in 1857, as compared with those of the preceding years of which we have any record stands thus:

In 1851	$34,492,000	In 1855.....	$45,192,631
In 1852	45,779,000	In 1856.....	50,604,434
In 1853	54,065,000	In 1857.....	48,889,687
In 1854	51,429,000		

The exports in 1857, when compared with those of 1856, show a small falling off compared with those of 1855. There is a large item connected with the exports of last year which in reality has no bearing one way or another on the product of gold in this State.

We refer to the shipments of treasure to China and Manilla. In 1857 the exports to those points were $3,272,164, almost wholly made up of doubloons and dollars received from Mexico. San Francisco imported in 1857 $3,168,711 in specie, nearly all of which came from Mexico, and went from here to China and the East Indies. More gold every year goes to England direct, and less to New York; the figures for five years past show the change in this respect:

Exported to New York.		Exported to England.	
1853.....	$47,916,448	1853.....	$4,975,662
1854.....	46,389,649	1854.....	5,781,660
1855.....	38,780,564	1855.....	5,182,156
1856.....	39,765,294	1856.....	8,666,289
1857.....	35,287,778	1857.....	9,347,748

The Light-house Board Report for 1857 states that "the steam tender authorized by Congress in 1856, and built at the Philadelphia navy yard, will reach San Francisco probably early in the year 1858. The presence of this vessel will serve the economical purpose of transporting supplies, materials, and workmen for building and repairing the light-houses, and also, in case of incursions of the Indians from the British dominions in the Straits of Fuca and vicinity, to protect the keepers and citizens in that quarter against their attacks. Representations have been made that a light is necessary between the bays of Monterey and San Francisco, and one on Mare Island, in San Francisco Bay. The latter is recommended mainly in consideration of the difficulties at night in approaching the navy yard and Benicia."

Port Charges.—Pilotage outside Farralones, $10; inside Farralones, $8 per foot; tonnage dues, 4 cents per ton; dockage. 3 to 6 cents per ton per day; stevedore's charges, 75 cents per ton; shipping men, $5 each; ballast, rough stone, $2 25 per ton; cobble stone, $2 75; sand, $1 50. Water, 1½ cents per gallon. Day labor, $5. Port-warden, $30 to $75.

Exchange.—On Atlantic States, sight, 3 per cent.; England, sight, —d. at 47*d.* per dollar; France, sight, 4 80 frs.

Money.—Scarce at 2 to 4 per cent. on good security. Doubloons very scarce, and wanted—7 per cent. premium. Mexican dollars, do. do. 7 per cent. premium.

Rate of Interest on Money.—By an act passed March 13, 1850, the rate of interest on money was fixed at 10 per cent. where there was no special contract; but "parties may agree in writing for the payment of any rate of interest whatever on money due, or to become due on any contract. Any judgment rendered on such contract shall conform thereto, and shall bear the interest agreed upon."

San Francisco (Bay of), California. One of the best harbors of the Pacific Ocean. The entrance is very remarkable, bold, and rocky; a mile wide and 4 miles in length, with deep water and no obstructions. It then expands into an extensive bay, in which lie several islands; that of San Angelo is the largest and highest, and covered with vegetation to its very top. The next in size are Yerba Buena and Alcatraz. The Bay of San Francisco is 36 miles in length by an average of 6 in width. A large portion of its southern, eastern, and northern shores is bordered by extensive and wide mud-flats, preventing the landing, at low water, of even a boat; so much so, that the eastern shore may be said to be inaccessible for a distance of 30 miles; and this impediment prevents it from ever becoming useful, except by the construction of extensive artificial works. On the north it is bounded by the Straits of San Pablo, which divide it from the bay of that name. The Bay of San Pablo is nearly circular, about 10 miles in diameter, the largest segment of which is a mud-flat, with but a few feet of water over it. On the east side lies the channel, with a sufficient depth of water for large vessels, leading to the Straits of Karquines, at the mouth of the Sacramento River. On the western side of the Bay of San Francisco, from the Straits of San Pablo, for a distance of 15 miles, the country is broken and mountainous, and the shores rocky and indented by small bays. These obstructions reduce this extensive bay very much in size, and it becomes still more so when the safety and convenience of vessels is taken into consideration; indeed, with the deep water, cross-tides, and exposed situations, there are but two safe anchorages, viz., San Francisco and Sausalito. The Bay of San Francisco has been celebrated, from the time of its first discovery, as one of the finest in the world, and is justly entitled to that character, even under the seaman's view of a mere harbor.

San Juan, or St. John (sea-port of Porto Rico). Although possessing a magnificent port, considered one of the best on the island, San Juan is not the first commercial place, as the products exported thence are of a very inferior quality. Of the sugar shipped from this port, as well as from the other ports of the island, the United States receives more than two-thirds of the whole. But a small quantity goes to England, and also, though rarely, to France. From the United States are imported codfish and other salt fish; salt meat, boards, lumber, hoops, staves, and butter; from England, boilers for the manufacture of sugar, machinery, small quantities of iron, and heavy supplies of earthen-ware. Spanish vessels take in cargoes at St. Thomas, and discharge at San Juan, thereby avoiding the duty applicable to all vessels from all other adjacent foreign ports, in the ports of Porto Rico. Generally speaking, the whole island of St. Thomas is but a great entrepôt of European and American manufactures destined for the markets of Cuba and Porto Rico—a fact shown by the large amount of importations from St. Thomas into both these islands. The annual exports from San Juan in 1853 consisted of 11,369,304 lbs. of sugar; 5803 hhds. of molasses; 876 hhds. of rum; and 910,966 lbs. of coffee. It is to be regretted that the port of San Juan, one of the best and safest of the island, should be kept in so deplorable a condition. Six or seven years ago, a vessel drawing 16 to 18 feet water could take in a full cargo at the wharf; at present a ship of the same tonnage can receive only three-fourths of her cargo, and is compelled to leave the wharf in order to get into water deep enough to take in the balance.

San Juan de Nicaragua (*pseudo Greytown*), a sea-port town of Nicaragua, Central America, at the mouth of the San Juan, in the Caribbean Sea, lat. 10° 55′ N., long. 83° 43′ W. It is stated to have the best port on this coast between Cape Gracias à Dios and the Boco del Toro, and to be much more healthy than Chagres. It has an export trade in hides, indigo, and coin, brought down the San Juan in boats from Granada. It was almost entirely destroyed by Captain Hollins, in command of the frigate *Cyane*, July, 1851, to obtain redress for an insult to the American envoy to Central America.—*See* NICARAGUA.

San Juan del Sul, a port of Nicaragua, Central America, on the Pacific Ocean, 24 miles southwest from Nicaragua, and the maritime harbor nearest to that city. Lat. 11° 15′ 37″ N., long. 85° 52′ 56″ W. It has a good (small) harbor, surrounded by high land, except on the southwest by south, where it lies open to the ocean. It is one of the proposed termini of the canal from Lake Nicaragua.

San Salvador. This is the smallest of the Central American states, embracing but 7500 square miles, and is separated from Nicaragua by the Bay of Conchagua. The soil is in many places exceedingly fertile, but the country is generally hilly and mountainous. Indian corn, cotton, coffee, and various kinds of vegetable produce, are cultivated to some extent. The most important article of cultivation, and, indeed, the chief staple of San Salvador, is indigo, which grows in great perfection and abundance. Near the coast, the lands of Acajutla and Libertad produce the article known in commerce as the balsam of Peru, of which

about 20,000 lbs. is the annual yield. The inhabitants display much ingenuity in the manufacture of an article of female dress, called by the natives *rebosa*, which is much used in Central America and Mexico. San Salvador has a coast line along the Pacific of about 150 miles, with the ports of Acajutla and Libertad, and within the Bay of Conchagua the excellent harbor of La Union. Commercial relations between the United States and San Salvador are regulated by treaty of January 2, 1850. This treaty is based upon the principle of the most favored nation, and stipulates for reciprocity of commerce and equality of flag, without any discrimination as respects the origin of cargoes.

Sapan-wood is obtained from a species of the same tree that yields the Brazil-wood (*Cæsalpinia Sapan*, Linn.). It is a middle-sized forest tree, indigenous to Siam, Pegu, the Philippine Islands, etc. It has been employed for dyeing in the greater part of Asia for many centuries. It found its way into Europe some time before the discovery of America; and the imports are now very considerable. Its coloring matter differs but little from that of Brazil-wood, but the best sapan-wood does not yield more than half the quantity that may be obtained from an equal weight of Brazil-wood, and the color is not quite so bright.—BANCROFT *on Colors*, vol. ii. p. 329.

Sapphire (Ger. *Sapphir*; Du. *Saffiersteen*; Fr. *Saphir*; It. *Zaffiro*; Sp. *Safiro*, *Safir*; Russ. *Jachant*; Lat. *sapphirus*), a precious stone in very high estimation. Colors blue and red; also gray, white, green, and yellow. It occurs in blunt-edged pieces, in roundish pebbles, and crystallized. Varies from transparent to translucent. Refracts double. After diamond, it is the hardest substance in nature. The blue variety, or sapphire, is harder than the ruby, or red variety. Brittle, specific gravity 4 to 4·2. It is found in Bohemia, Saxony, France, etc.; but the red sapphire, or Oriental ruby, is not found in any considerable quantities any where except in Ava. Next to diamond, sapphire is the most valuable of the gems. The white and pale blue varieties, by exposure to heat, become snow-white, and, when cut, exhibit so high a degree of lustre that they are used in place of diamonds. The most highly prized varieties are the crimson and carmine red; these are the Oriental *ruby* of the jeweler; the next is *sapphire;* and last, the yellow or Oriental *topaz*. The *asterias*, or star-stone, is a very beautiful variety, in which the color is generally of a reddish violet, and the form a rhomboid, with truncated apices, which exhibit an opalescent lustre.

Sarcocolla, a sub-viscid, sweetish, and somewhat nauseous gum resin. It is brought from Arabia and Persia in small grains of a pale yellow color: the whitest, as being the freshest, is preferred. It is but seldom imported.—MILBURN'S *Orient. Com.*

Sardines, or **Sardinias** (Ger. *Sardellen*; Fr. *Sardines*; It. *Sardine*; Sp. *Sardinas*), a species of fish of the herring tribe, but smaller. They are taken in considerable quantities on our coasts, and are exceedingly plentiful on the coasts of Algarve in Portugal, Andalusia and Granada in Spain, and along the shores of Italy. The small sardines caught on the coast of Provence, in France, are esteemed the best. From 1000 to 1200 fishing smacks are engaged in catching these fish on the coast of Brittany, from June to the middle of October. The French frequently cure them in red brine; and, when thus prepared, designate them *anchoisées*, or *anchovied sardines*. These are packed in vessels previously employed for holding wine, and exported to the Levant. When perfectly fresh, sardines are accounted excellent fish; but if kept for any time, they entirely lose their flavor, and become quite insipid.

Consumption of Sardines in the United States.—The importation of sardines into the United States is increasing every year. The fisheries commence about the middle of May, and last until about the middle of October. The quantities consumed are enormous. Each evening, upon the return of the fishing smacks, they can be bought for a few cents per dozen; they are an important part of the food of the poorer classes. These fish are better, and have a flavor, when put up in oil, which they otherwise have not. They are found in great plenty from the coast of Bretagne to the mouth of the Garonne. La Rochelle is the principal depôt for the fishery. The quantity exported to the United States in 1852 was 59,840 kilogrammes; in 1853 the quantity was 76,787 kilogrammes; in 1854 the quantity was estimated at 100,000 kilogrammes, and of this more than one half, strange to say, was for California. —*Letter to the Dep. of State.*

Sardinia. The whole area of this kingdom, including Piedmont, Savoy, and Genoa, and the island of Sardinia, is estimated at 28,229 square miles, containing a population, in 1852, of over 5,000,000, viz.: the continental states 18,994 square miles, population 4,500,000; and the island of Sardinia 9235 square miles, population 500,000.

The chief staples of this kingdom are raw silk, rice, maize, wheat, chestnuts, wines, olives and olive-oil, figs, oranges, and citrons. In the island of Sardinia the productions are maize, wheat, hemp, silk, beans, and other pulse vegetables. There are several extensive vineyards, though the wines are not in much repute in foreign markets. Piedmont is considered the most productive part of the continental kingdom, and usually exports its surplus produce for the consumption of Genoa, Nice, and the regions along the coast. Silk is one of the most profitable productions.* The olive and vine are extensively cultivated; wheat and Indian corn are also grown; the latter of which, mixed with roasted chestnuts, constitutes the chief food of the rural inhabitants. The minerals of the country are valuable, consisting of iron, copper, lead, manganese, and cobalt; but, owing to bad roads and the lack of capital, they are not worked. The salt springs and mines of alabaster, marble, and slate, receive the protection of the government, and their products constitute some of the chief exports of Sardinia. The exportation of marble alone to the United States amounts annually in value to about $15,000. The manufactures consist of silks, velvets, and other silk stuffs, stockings, common linens and woolens, and the product of the tanneries; but, with the exception of silks, few of these manufactures are exported. The chief ports are Genoa, Spezzia, and Nice, on the continent, and Cagliari, on the island of Sardinia. Genoa is a free port, in which goods may be warehoused or re-exported free of duty. It is the chief outlet of the Mediterranean for the manufactures of Switzerland, Lombardy, and Piedmont.

In 1815 the republic of Genoa was ceded to the King of Sardinia, with the express stipulation that "the free port of Genoa shall be re-established, with the regulations which existed under the ancient government. Every facility shall be given by the king to the transit through his states of merchandise from that free port, under such restrictions as his majesty shall judge expedient for preventing the said merchandise being illicitly sold or consumed in the interior. It shall be subject only to the usual moderate duty." The commercial relations of the United States with Sardinia are regulated by treaty. Prior to the ratification of this treaty (November 26, 1838), the commerce of the United States with this kingdom was conducted exclusively under foreign flags. Indeed, until within a recent period, the commercial system of the Sardinian government was directly opposed to the principle of free intercourse. The treaty with the United States guarantees entire reciprocity and perfect equality with the Sardinian flag in the direct and indirect trade. The following are the stipulations of this treaty which relate to commerce:

* Piedmont and Lombardy produce more raw silk than all the rest of the world together.

Perfect reciprocity of commerce and navigation between the two countries, inhabitants of the one enjoying in the other all the privileges of subjects or citizens. Vessels in their respective ports to enjoy the same privileges, and to pay no higher duties or charges than national vessels. All commodities and merchandise, the produce of the soil or industry of the United States, or of any other country, which may be legally imported into Sardinian ports in Sardinian vessels, may also be imported by American vessels, and pay no higher duties. Sardinian vessels to enjoy the same privileges in the ports of the United States. The same principle extended to all exports from either country. The vessels of each country may enter the port of the other with cargoes from any foreign country whatever. Any duty or restriction imposed on the vessels or merchandise of the one country in the other to be extended to the vessels or merchandise of all nations. Coasting trade reserved to national vessels. Special favors to any other nation to be enjoyed by the contracting parties respectively. Vessels of either country forced into the ports of the other by stress of weather to be exempted from port charges.

Article 9 stipulates free transit from the port of Genoa across Piedmont, except for salt, gunpowder, and manufactured tobacco.

Cagliari, the capital of Sardinia, on the northeast shore of a spacious bay on the south coast of the island, lat. 39° 12′ 13″ N., long. 9° 7′ 44″ E. Population in 1850 estimated at 30,000. The city stands on a rising ground, and has an imposing effect from the sea. The public buildings and churches are numerous, and some of them splendid; but the streets are for the most part narrow, steep, and filthy. The Gulf of Cagliari extends from Pula on the west, to Cape Carbonara on the east, a distance of about twenty-four miles across, and about twelve in depth, with good anchorage every where after getting into soundings. A mole projects from the Pratique office, and ships usually lie about one mile southwest by south from it, in six or eight fathoms water, on an excellent bottom of mud. There is a very convenient pier harbor at the south angle of the tower wall, capable of containing fourteen or sixteen vessels of a tolerable size, besides small craft. Altogether Cagliari is one of the best and safest ports in the Mediterranean. Vessels belonging to Sardinia are admitted by treaty into the ports of the United States on the same terms as American vessels, with the produce or manufactures of their own or any other country.—*See* CAGLIARI.

Other usual provisions respecting the appointment of consuls, etc., are made; and, in a separate article, his Sardinian majesty continues the differential duties in favor of Sardinian ships on the importation of wheat, olive-oil, and wine, from the ports of the Black Sea, Adriatic, and Mediterranean, as far west as Cape Trafalgar. This separate clause is explained by the fact that the grain, oil, and wine trade, carried on with the ports of the Mediterranean, has always been the chief source of the commercial prosperity of Genoa. On the 12th July, 1850, this differential position was abandoned, and American vessels can now engage in the grain-carrying trade, as well as in all other kinds of commerce, between Genoa and other ports within the Mediterranean and Black seas, on terms of perfect equality with Gencese vessels. The separate article has, therefore, become a dead letter.

Genoa is the only port in Sardinia much frequented by United States vessels. The port charges are: For pilotage, according to draught; anchorage, 30 centimes* per ton; quarantine dues, 3 centimes per ton each day; board of health fees, 40 centimes per ton; measurement charges, according to size of vessel.

The shipping frequenting the port of Cagliari, on the Island of Sardinia, has considerably increased during the past ten years. This is owing to the shelter and refuge it affords in stormy weather, and to the facilities it offers for obtaining all necessary supplies.

This may be seen from the following statement, showing the number and tonnage of vessels of all nations that have visited this port since 1846:

Years.	No. of Vessels.	Tonnage.
1846	479	22,503
1847	434	48,545
1848	469	54,393
1849	601	71,959
1850	497	53,852
1851	540	56,941
1852	567	61,489
1853	639	88,785
1854	803	96,439

The chief articles of American produce consumed in Sardinia are cotton and tobacco. The former is free, and on the latter the duty is "*reserved*," it being a government monopoly. Whalebone, refined sugar rum, paints, and other minor articles, are also exported from the United States to Sardinia, but to no considerable amount.

The following table exhibits the quantity and value of cotton and tobacco exported from the United States to Sardinia from 1850 to 1855, both years inclusive:

Years.	Cotton.	Values.	Tobacco	Values
	Pounds.		Hhds.	
1850	1,566,720	$152,910	107	$9,208
1851	2,126,100	251,838	8	818
1852	5,588,928	416,982	3414	341,170
1853	1,699,026	166,422	192	21,900
1854	1,645,372	147,462	55	10,500
1855	14,777,765	1,288,387	3311	383,245

Imports into the United States from Sardinia consist chiefly of flax, olive-oil, rags, silk, piece goods, red wines, wool (unmanufactured), marble, and manufactures of wool. Marble is the most valuable article received, amounting annually to upward of $30,000

Almost all the trade of Sardinia is carried on by strangers; and even the fish on its coast and in its harbors are caught by Sicilians, Neapolitans, Tuscans, and Genbese Grain is the principal article of export In good years, the exports from the whole island may amount to 400,000 starelli, or about 500,000 bushels of wheat, 200,000 starelli of barley, 6000 starelli of maize, 100,000 starelli of beans, 200,000 starelli of peas, and 1000 starelli of lentils. The culture of vines is gradually becoming of more importance; and about 3500 Catalan pipes are exported, principally from Alghero and Ogliastro. Cheese is an important object in the rural economy of Sardinia, and considerable quantities are exported. Salt is a royal monopoly, and affords a considerable revenue. Until recently, Sweden drew almost all her supplies of this important necessary from Sardinia, and it continues to be exported in considerable quantities. Flax, linseed, hides, oil, saffron, rags, alquifoux, etc., are among the articles of export. The tunny and coral fisheries employ a good many hands; but, as already observed, they are almost wholly managed by foreigners.

ACCOUNT OF THE QUANTITIES OF THE PRINCIPAL ARTICLES EXPORTED FROM THE ISLAND OF SARDINIA TO FOREIGN COUNTRIES IN 1849, 1850, AND 1851.

* 100 centimes are equivalent to 19·6 cents.

Almost every article of dress, whether for the gentry or the peasantry, is imported. Soap, stationery, glass, earthen-ware, and furniture, as well as sugar, coffee, drugs, etc., are also supplied by foreigners; and notwithstanding the Sards possess many rich mines, several of which were successfully wrought in antiquity, they import all their iron and steel. The only manufactures carried on in the island are those of gunpowder, salt, tobacco, and woolen caps. But salt, of which the export may be estimated at 14,000 or 15,000 tons a year, is excluded from the preceding table, on which, indeed, but little reliance can be placed.

These statements sufficiently show that the commerce of Sardinia is very far from being what might naturally be expected from her extent, fertility, admirable situation, and the excellence of her many harbors.

The following summary presents a general view of the foreign commerce of Sardinia:

1850.—Imports	111,870,000	francs.
Exports	93,966,000	"
Total foreign trade in 1850	205,736,000	"
1851.—Imports	129,790,025	francs.
Exports	73,133,000	"
Total foreign trade in 1851	202,923,000	"

Navigation in 1850..Vessels, 2420—Tonnage, 277,717
" 1851.. " 2598 " 296,280
" 1852.. " 3250 " 368,400

Of these there were under the American flag:

In 1850	Vessels, 27	Tonnage	6,176
In 1851	" 19	"	7,577
In 1852	" 88	"	10,024

The trade of the kingdom in 1858 amounted in value to 333,942,000 francs ($63,448,980) imports; and 220,630,000 francs ($41,919,700) exports. In 1852 the direct trade between the United States and Sardinia amounted to 7,725,862 francs ($1,477,818 78). In 1853 it reached as high as 18,891,561 francs (2,689,896). showing an increase of nearly 100 per cent.

The entire trade, compared with that of 1852, shows an increase of 21,500,000 francs on imports, and of 5,500,000 francs on exports. The imports comprise in values (in round numbers) as follows: Cotton, 34,000,000 francs; colonial or trans-Atlantic produce, 25,000,000; corn, 22,000,000; silks, 20,000,000; woolens, 18,000,000, etc. The exports comprise: Silks, 43,000,000 francs; wine and oil, 10,000,000 francs; rice, 8,000,000; cattle, 4,000,000, etc.

The countries with which Piedmont carries on the largest trade are as follows:

Imports.	Francs.	Exports.	Francs.
France	48,000,000	France	40,000,000
England	30,000,000	England	3,500,000
Switzerland	14,500,000	Switzerland	13,000,000
Austria	10,000,000	Austria	16,000,000
Russia	17,000,000	Russia	103,000
United States	13,000,000	United States	531,000

The customs' revenue amounted in the year 1853 to $3,464,472.

Sardinian official returns show an importation of raw cotton, direct from the United States, for 1853, of about $2,000,000 in value; and it is supposed that while of the remainder some undoubtedly came from Algeria, the greater part came indirectly from the United States, through England, Holland, etc. If, however, these Sardinian returns are compared with those prepared by the United States Treasury Department, it will appear that the direct importation of cotton from the United States must be, as it unquestionably is, largely over-estimated; while the indirect importation from English, Dutch, and other European ports is much below the actual quantities given. Thus the value of cotton exported from the United States to Sardinia in 1853, as per United States Report on Commerce and Navigation, was only $156,422; and in 1852, $416,982; making for both years the sum of $573,404, or a little more than one-fourth of the value given in the Sardinian returns for 1853 alone. The following summary presents as accurate a statement of the cotton trade of Sardinia as can be derived from a comparison of the official reports of the European countries whence cotton is re-exported, and of the United States, with the official returns of the Sardinian government. The countries given are not the only, but the principal countries, whence Sardinia imports cotton:

Pounds of Cotton imported into Sardinia for the four years ending 1854 from the Countries designated.

Years.	Great Britain.	France.	United States.	Total.
1851	2,742,320	No data.	2,136,100	4,873,420
1852	2,938,308	3,497,389	5,568,823	11,904,420
1853	3,800,864	1,483,320	1,629,025	6,079,218
1854	3,821,326	1,197,841	1,645,372	6,674,541
Average	3,165,680	2,081,519	2,744,330	7,494,150

The railroad facilities afforded at the port of Genoa for the transmission of merchandise to the interior of Italy, Switzerland, etc., have already produced a marked effect on the cotton trade of that port. It has been shown that the total quantity of cotton exported from the United States to Sardinia was, in 1851, 2,136,000 lbs.; in 1852, 5,568,823 lbs.; in 1853, 1,629,025 lbs.; in 1854, 1,645,372 lbs. In 1855 the exportation reached 14,777,765 lbs., of which the port of Genoa received 10,035,600 lbs.; and an official document received from Genoa gives the quantity received at this port from the United States, in American vessels alone, the first six months of 1856, at 12,164,000 lbs.—C. D.

Money, Weights, and Measures.—Accounts are kept in lire, reali, and soldi. 5 soldi = 1 real = 4½*d.*; 4 reali = 1 lira = 1*s.* 6*d.*; 10 reali = 1 scudo = 3*s.* 9*d.* The paper money consists of notes for 5, 10, and 20 scudi. Farm produce and the coarser metals are weighed by the *pesi di ferro:* 12 Sardinian oz. = 1 lb. = 14 oz. 5 dr. avoirdupois; 26 lbs. = 1 rubbo; 4 rubbi = 1 cantaro = 93 lbs. 8 dr. avoirdupois. The starello or corn measure is equivalent to 1 bushel 1¼ peck English. The palm = 10½ English inches.

Commerce of the United States with Sardinia from October 1, 1840, to July 1, 1856.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Sardonyx, a precious stone, a variety of chalcedony. The ancients selected this substance to engrave upon, no doubt, from its possessing two peculiar and necessary qualities: viz., hardness and tenacity, by which it is capable of receiving the finest touch or stroke of the tool without chipping, and showing the art of the engraver to the highest perfection.—MAWE *on Diamonds*.

Sarsaparilla (Ger. *Sarsaparille*; Fr. *Salsepareille*; It. *Salsapariglia*; Sp. *Zarsaparilla*), the root of the *Smilax Sarsaparilla*, a plant growing in South America and the West Indies. It is imported in bales. It is known in the London market by the names of Lisbon, Honduras, and Vera Cruz, but it is also brought from Jamaica. The Lisbon root, which is the produce of Brazil, has a reddish or dark brown cuticle, is internally farinaceous, and more free from fibre than the other kinds: the Honduras has a dirty brown, and sometimes whitish, cuticle; it is more fibrous, and has more ligneous matter than the Lisbon and Vera Cruz. It is in long, slender twigs, covered with a wrinkled brown cuticle, and has a small, woody heart. The Jamaica differs from the others, in having a deep red cuticle of a close texture, and the red color partially diffused through the ligneous part. The root is inodorous, and has a mucilaginous, very slightly bitter taste: the bark is the only useful part of the plant; the ligneous part being tasteless, inert, woody fibre.—THOMSON'S *Dispensatory*.

Sassafras (Ger. and Fr. *Sassafras*; It. *Sassafrasso*; Sp. *Sassafras*), a species of laurel (*Laurus Sassafras*, Linn.), a native of the southern parts of North America, Cochin-China, and several of the Indian islands. Sassafras wood, root, and bark have a fragrant odor, and a sweetish aromatic taste. The wood is of a brownish white color; and the bark ferruginous within, spongy, and divisible into layers. Their sensible qualities and virtues depend on an essential oil, which may be obtained separate by distilling the chips or the bark with water. It is very fragrant, hot, and penetrating to the taste, of a pale yellow color, and heavier than water. It is used only in the materia medica.—THOMSON'S *Dispensatory*.

Satin (Eng., Fr., and Germ.) is the name of a silk stuff first imported from China, which is distinguished by its very smooth, polished, and glossy surface. It is woven upon a loom with at least five-leaved healds or heddles, and as many corresponding treddles. These are so mounted as to rise and fall four at a time, raising and depressing alternately four yarns of the warp, across the whole of which the weft is thrown by the shuttle, so as to produce a uniform smooth texture, instead of the checkered work resulting from intermediate decussations, as in common webs. Satins are woven with the glossy or right side undermost, because the four-fifths of the warp, which are always left there during the action of the healds, serve to support the shuttle in its race. Were they woven in the reverse way, the scanty fifth part of the warp threads could either not support, or would be too much worn by the shuttle.

Saunders (Red) (Arab. *Sundal-ahmer*; Hind. *Ruckut-chundum*), the wood of a lofty tree (*Pterocarpus santalinus*) indigenous to various parts of India, Ceylon, Timor, etc. The wood is brought to Europe in billets, which are very heavy, and sink in water. It is extremely hard, of a fine grain, and a bright garnet red color, which brightens on exposure to the air. It is employed to dye lasting reddish brown colors on wool. It yields its coloring matter to ether and alcohol, but not to water.—THOMSON'S *Dispensatory*; BANCROFT *on Colors*, vol. ii. p. 236.

Savannah, city, port of entry, and capital of Chatham county, Georgia, is situated on the right bank of the Savannah River, 17 miles from its mouth. It is in 32° 4′ 56″ N. lat., and 81° 8′ 18″ W. long. from Greenwich, and 4° 10′ W. from Washington. It is 118 miles southwest from Charleston, 128 miles southeast from Augusta, 158 miles east-southeast from Milledgeville, 662 miles south by west from Washington. The population in 1810 was 5195; in 1820, 7523; in 1830, 7776; in 1840, 11,214; in 1850, 15,812; in 1854, 19,000. This city was founded in 1733 by General James Oglethorpe and others. It was taken by the British in 1778, but they abandoned it in 1782. On the 10th of January, 1820, 463 buildings were burned, occasioning a loss of property amounting to $4,000,000; but it has been rebuilt with additional beauty. There are in Savannah eight banks, aggregate capital $4,900,000; four printing-offices, issuing three daily and one weekly newspaper. Capital employed in manufactures, 1850, $180,550; value of manufactured articles, $256,250. Savannah is the port for an extensive region, rich in agricultural and mineral wealth, and by the immense extent of railroad converging to this point (about 1200 miles) will undoubtedly be the port of the Southern Atlantic coast. The cotton shipped from Savannah for the years 1856-'57 amounted to 327,658 bales.—*See* GEORGIA.

The recent construction of railroads from Savannah westwardly has an important bearing, present and prospective, upon the commerce of Savannah. Those in operation in 1857 are as follows:

Georgia Rail-road	292 miles.
Central, Savannah to Macon	191 "
Southwestern and Muscogee	178 "
Macon and Western (to Atlanta)	101 "
Western, to Chattanoga	138 "
Atlanta and Lagrange	87 "
Total	927 "

These roads connect either directly or indirectly with 800 miles of railroad in Tennessee.

Saxe-Meiningen (one of the Zoll-Verein). The general trade between this duchy and the United States is increasing. Her manufactures are deservedly in high repute, and are chiefly destined for the American market. They consist of leather, woolen and cotton stuffs, musical instruments, toys of every description, china, glass, iron, stone, and willow wares, slate pencils, marbles, nails, drugs, colors, wooden wares, etc.

This duchy is rich in mineral productions, and mining is pursued with considerable activity. Iron, copper, coal, alum, vitriol, marble, and salt are extensively produced, and enter largely into the exports of the duchy. Exports for the United States are transported either to Bremen, Hamburg, Antwerp, Rotterdam, or Havre.

The following statement exhibits the value of exports, the produce and manufacture of Saxe-Meiningen, to the United States, during a period of five years, from 1851 to 1855, both inclusive, specifying the countries through which said exports were shipped for the United States:

Years.	Via			Total.
	Hamburg.	Bremen.	France.	
1851	....	$20,456	....	$20,456
1852	$743	39,665	$2829	43,239
1853	5818	40,062	260	46,540
1854	247	10,368	....	10,615
1855	....	6,171	....	6,171

The exports from the United States to this duchy consist of tobacco, rice, breadstuffs, cotton, and manufactures of India-rubber, etc. The soil, owing to the vast forests and mountains which cover so much of its surface, is not favorable to agricultural pursuits; hence breadstuffs form a large item of imports from foreign countries.

Saxony (one of the Zoll-Verein). This kingdom lies in the centre of Germany, and though the soil is generally fertile in grain, and is cultivated with the greatest care, the quantity raised, even in the best harvests, is not more than sufficient for the consumption of the inhabitants. Wheat, rye, oats, barley, and potatoes are the general crops.

Saxony is rich in mines of iron, lead, copper, cobalt,

bismuth, antimony, and coal; consequently we find that mining and manufactures occupy the principal portion of its nearly 2,000,000 inhabitants. There are upward of 500 mines in active operation, the centre of which is at Freiburg. Fruit is extensively cultivated, and excellent wine is produced from the vineyards of the Elbe. The forests, which cover one-fourth of the surface, furnish fine timber, which is floated down the Elbe to Hamburg. The chief manufactures of Saxony are those of cotton, in the spinning of which the latest improvements have been introduced.* The other chief branches of manufacturing industry are linen and woolen weaving, stocking-making, and the fine porcelain of Meissen, known in commerce as Dresden china. Dresden and Leipsic are the commercial marts of Saxony. Annual fairs are held in these cities, which are attended by vast concourses of people from most of the countries of Europe and Western Asia. Leipsic is the great emporium of the book trade of Germany; and in both these cities manufactures, particularly in silk and woolen fabrics, jewelry, musical and scientific instruments, artificial flowers, etc., are carried to the very highest state of perfection. Leipsic communicates by railroad with Dresden, and the trade of the latter is conducted up and down the Elbe.

The following statement exhibits the value of exports, the produce and manufactures of Saxony, to the United States, during a period of five years, from 1851 to 1855, both inclusive, specifying the countries through which said exports were shipped for the United States:

Years.	Via						Total
	Hamburg.	Bremen.	Holland.	France.	Belgium.	England.	
1851	$115,259	$593,008	....	$82,361	$8,583	$56,755	$856,916†
1852	351,364	1,650,338	$4220	151,916	12,131	143,906	2,313,884
1853	375,496	1,657,306	2104	181,589	9,042	156,214	2,382,651
1854	231,658	945,352	6137	143,414	11,345	170,395	1,511,798†
1855	331,231	2,013,916	6437	114,745	25,303	169,915	2,710,591

† These figures are for the port of New York only, and for six months. No returns are at hand for the general trade.

Scammony (Ger. *Skammonien*; Fr. *Scammonée*; It. *Scammonea*; Sp. *Escamonea*), a gum-resin, the produce of a species of convolvulus, or creeper plant, which grows abundantly in Syria. When an incision is made into the roots, they yield a milky juice, which being kept, grows hard, and is the scammony of the shops. It is imported from Aleppo in what are called drums, weighing from 75 to 125 lbs. each; and from Smyrna in cakes like wax, packed in chests. The former is light and friable, and is considered the best; that from Smyrna is more compact and ponderous, less friable, and fuller of impurities. It has a peculiar heavy odor, not unlike that of old cheese, and a bitterish, slightly acrid taste. The color is blackish or bluish gray, changing to dirty white, or lathering when the surface is rubbed with a wet finger. Its specific gravity is 1·235. It is very liable to be adulterated; and when of a dark color, heavy, and splintery, it ought to be rejected. It is used only in medicine.—THOMSON'S *Dispensatory*.

Schooner, in *Nautical language*, a small vessel with two masts, whose mainsail and foresail are suspended from gaffs, reaching from the mast toward the stern, and stretched out below by booms, and whose foremast ends are hooked to an iron, which clasps the mast so as to turn therein as upon an axis, when the after ends are swung from one side of the vessel to the other.

Scotland, the northern portion of Great Britain, extends in its main land from lat. 54° 38′ to 58° 41′ N., and long. 1° 45′ to 6° 14′ W., and, including its islands, to lat. 60° 50′ N., and long. 8° 35′ W.

Scotland is separated from England by a waving line of the Cheviot Hills in the centre, by the Tweed, which enters the sea at Berwick, on the east, and by the Solway Firth on the west. Its eastern shores are washed by the North Sea, and its western by the Atlantic. It is of an oblong, irregular form, extending longitudinally due north and south 280 miles, and varying in breadth from 175 to 100, 50, and 30 miles. Area, 31,324 square miles, or 20,047,462 acres, 6·9 acre to a person, 92 persons to a square mile. Population in 1801, 1,599,068; in 1841, 2,620,184; in 1851, 2,888,742. For Manufacturing Districts, etc., of Scotland, *see* BLACKWOOD'S *Magazine*, l. 659, lxv. 192; *London Quarterly Review*, lxxxii. 187. For Scottish Fisheries, *see London Quarterly Review*, lxix. 226; *North British Review*, l. 326.

The relative commerce of the three leading Scotch ports, compared with the leading ports of England and Ireland, is shown in the following table, showing the declared value of British and Irish produce and manufactures exported to foreign countries for each year, from 1851 to 1855:

SCOTLAND.

Years.	Glasgow.	Leith.	Greenock.
1851.....	£3,499,000	£381,200	£491,000
1852.....	3,570,300	491,200	418,600
1853.....	4,908,000	575,000	437,500
1854.....	4,905,500	727,600	554,500
1855.....	3,916,500	536,500	452,800

ENGLAND.

Years.	London.	Liverpool.	Hull.
1851.....	£14,489,400	£37,918,600	£10,126,400
1852.....	15,802,100	38,469,500	9,894,200
1853.....	22,991,000	47,152,100	10,788,700
1854.....	23,330,200	46,719,100	10,003,100
1855.....	20,915,500	46,323,400	10,079,600

IRELAND.

Years.	Cork.	Belfast.	Dublin.
1851.....	£100,400	£50,100	£50,000
1852.....	141,000	54,500	75,100
1853.....	129,600	35,900	22,800
1854.....	148,000	28,700	41,400
1855.....	102,600	73,100	28,500

In Scotland there were in 1854–'5 forty-six savings-banks. The progress of these useful institutions is indicated by the following summary of Scotland, and of Great Britain and Ireland:

Years.	No. of Banks.	No. of Accounts.	Amount of Deposits. Scotland.	Savings Deposits. United Kingdom.
1850–'51....	43	105,161	£1,488,777	£30,277,854
1851–'52....	43	111,209	1,645,205	31,754,261
1852–'53....	45	116,113	1,837,103	33,302,260
1853–'54....	46	118,602	1,931,098	33,730,089
1854–'55....	46	....	2,011,473	34,201,721

Railways.—The progress of the railway system in Scotland has not been rapid. The following table exhibits the number of miles, capital raised per mile, and number of passengers per mile:

Years.	No. of Miles.	Capital raised per Mile.	Receipts per Mile per Annum.	
			From Passengers.	From Goods.
1849.....	795	£27,654	£680	£818
1850.....	902	27,612	664	790
1851.....	957	29,001	649	850
1852.....	970	29,476	663	958
1853.....	987	29,564	713	1075
1854.....	1019	29,792	742	1219
1855.....	1069	29,580	726	1277

—*See articles* GREAT BRITAIN and GLASGOW for an extended account of the trade and finances of Scotland. On the following page there is presented a tabular statement of the foreign commerce of the United States with Scotland for a series of twenty-seven years, showing the exports, foreign and domestic, the imports, and the tonnage cleared.

* The export of cotton tissues from the Zoll-Verein in 1853 amounted in value to $2,394,497 34, of which amount Saxony sent from her factories $2,075,399 68.

COMMERCE OF THE UNITED STATES WITH SCOTLAND, FROM OCTOBER 1, 1820, TO JULY 1, 1857.

Years ending	Exports.			Imports.	Whereof there was in Bullion and Specie.		Tonnage cleared.	
	Domestic.	Foreign.	Total.	Total.	Export.	Import.	American.	Foreign.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Scud, the name given by seamen to loose, vapory clouds driven swiftly along by the winds. *To scud*, signifies to run directly before the wind in a gale. As the object is to keep before the sea, the foresail or fore topsail is set: the latter or the main topsail is often necessary, as the foresail is often becalmed from the height of the waves.

Scudo. *See* COINS.

Scull, an oar, so short that one can work a pair. It most generally implies an oar placed over the stern of a boat, and worked from side to side; the blade, which is turned diagonally, being always in the water. In China, where the method is well understood, large boats are impelled by a single scull with considerable velocity.

Sculptures, figures cut in stone, metal, or other solid substance, representing or describing some real or imaginary object. The art of the sculptor, or statuary, was carried to the highest pitch of excellence in ancient Greece. Fortunately, several of the works of the Grecian sculptors have been preserved, and serve at once to stimulate and direct the genius of modern artists. *Models* are casts or representations of sculptures.

Scuppers are pipes of lead inserted in openings bored from the deck through the sides of a ship, to carry the water off from the deck to the sea. To avoid the inconvenience of having the scuppers broken by the working of the ship, each is formed of two pipes, one of which is passed upward to the deck through the opening in the ship's side, and having its lower end nailed on the outside planking; the other, which is of smaller diameter, after being woolded on the outside with flannel dipped in tallow, is passed downward into the lower pipe, through the opening in the deck, and its upper end secured on the plank of the deck. In order to prevent the entrance of water by these scuppers when the ship is inclined, valves of metal are placed over the external outer ends, which close with the pressure of the external water. In merchant vessels, leather pipes, called scupper-hoses, are sometimes nailed round the opening for the same purpose. Sometimes scuppers are only leaden pipes passed through the ship's side, and turned and fastened at each end.

Scuttles, in a ship, holes in the decks, either for air or as passages to the store-rooms; also openings in a ship's side for the admission of air. If, in order to sink a ship, a hole be cut in her bottom, she is said, in *Nautical language*, to be scuttled.

Sea. The jurisdiction over the seas has long been a question of difficulty and of doubtful right. Grotius published his *Mare Liberum* against the Portuguese claim to an exclusive trade to the Indies through the South Atlantic and Indian oceans, and he proves the sea is not capable of private dominion. He vindicates the free navigation of the seas, and the right of commerce, and exposes the absurdity of the Portuguese claim. Selden's *Mare Clausum* was written in answer to the doctrine of Grotius, and he undertook to prove, by the laws, usages, and opinions of all nations, ancient and modern, that the sea was capable of private dominion. He asserted that the English had long claimed and enjoyed a supremacy over the surrounding and narrow seas. Bynkershoick concedes to Selden much of his argument, and admits that private dominion may be exercised over adjoining seas; but denies the right of the English on the ground of a want of uninterrupted possession.

The claim of dominion to close or narrow seas is still subject to discussion. As far as a nation can conveniently occupy, and that occupancy is acquired by prior possession or treaty, the jurisdiction is exclusive. Navigable rivers which flow through a territory, and the sea-coast adjoining it, and the navigable waters

included in bays, and between headlands and arms of the sea, belong to the people of the adjoining territory, as being necessary to the safety of the nation, and to the undisturbed use of the neigboring shores. The open sea is not capable of being possessed as private property. The free use of the ocean for navigation and fishing is common to all mankind, and the public jurists generally and explicitly deny the main ocean can ever be appropriated. The subjects of all nations meet there, in time of peace, on a footing of entire equality and independence. No nation has any right or jurisdiction at sea, except it be over the persons of its own subjects, in its own private and public vessels; and so far territorial jurisdiction may be considered or preserved as portions of its territory, and persons on board are protected and governed by the law of the country to which the vessels belong. They may be punished for offenses against the municipal laws of the State, committed on board of its public and private vessels at sea, and on board of its public vessels in foreign ports. This jurisdiction is confined to the ship; and no ship has a right to prohibit the approach of another at sea, or to draw round her a line of territorial jurisdiction, within which no other is at liberty to intrude. Every vessel has a right, in time of peace, to consult its own safety and convenience, and to pursue its own course and business without being disturbed, when it does not violate the rights of others. As to narrow seas and waters approaching the land, there have been many and sharp controversies among European nations concerning the claim of exclusive dominion. The questions arising on this claim are not very clearly defined and settled, and extravagant pretensions are occasionally put forward. * * * Puffendorf admits that in a narrow sea the dominion of it may belong to the sovereigns of the adjoining shores. Vattel, also, lays down the position that the various uses to which the sea contiguous to the coast may be applied, render it justly the subject of property. * * * Chitty, in his work on Commercial Law, has entered into an elaborate vindication of the British title to the four seas surrounding the British Islands, and known by the name of British Seas, and, consequently, to the exclusive right of fishing and of controlling the navigation of foreigners therein. * * * On the other hand, Sir William Scott did not treat the claim of territory to contiguous portions of the sea with much indulgence. He said the general inclination of the law was against it; for in the sea, out of the reach of cannon shot, universal law was presumed, in like manner as a common use in rivers flowing through conterminous states was presumed; and yet in both cases there might exist a peculiar property excluding the universal or common use.—KENT's *Com.* vol. i.

The United States have recognized the general limitation of a marine league, or a cannon-shot distance; but considering the contour of our coast, the law of nations would justify, and it would not be unreasonable for us to claim, the control of the waters from Cape Ann to Cape Cod, and from Nantucket to Montauk Point, and from that point to the Capes of the Delaware, and from the South Cape of Florida to some point on our coast west of the mouth of the Mississippi.

Seal (Lat. *Sigillum*), a stone, piece of metal, or other solid substance, generally round or elliptical, on which is engraved the arms, crest, name, device, etc., of some state, prince, public body, or private individual. It is employed as a stamp to make an impression on sealing-wax, thereby authenticating public acts, deeds, etc., or to close letters or packets. Seals were very early invented, and much learning has been employed in tracing their history, and explaining the figures upon them. See particularly the work of HOPKINCK, *De Sigillorum Prisco et Novo Jure*, 4to, 1642.

Seal-fishery. The seal, an amphibious animal, of which there are many varieties, is found in vast numbers in the seas round Spitzbergen, and on the coasts of Labrador and Newfoundland. Seals are principally hunted for their oil and skins. When taken in the spring of the year, when they are fattest, a full-grown seal will yield from 8 to 12 gallons of oil, and a small one from 4 to 5 gallons. The oil, when extracted before putrefaction has commenced, is beautifully transparent, free from smell, and not unpleasant in its taste. The skin, when tanned, is extensively employed in the making of shoes; and, when dressed with the hair on, serves for the covering of trunks, etc.—For an account of the imports of seal skins, *see article* FURS.

To the Esquimaux the seal is of as much importance as bread to a European. Its flesh forms their most usual food; the fat is partly dressed for eating, and partly consumed in their lamps; the liver, when fried, is esteemed, even among sailors, as an agreeable dish. The skin, which the Esquimaux dress by processes peculiar to themselves, is made water-proof. With the hair off, it is used as coverings, instead of planks, for their boats, and as outer garments for themselves; shielded with which, they can invert themselves and canoes in the water, without getting their bodies wet. It serves also for coverings for their tents, and for various other purposes. The jackets and trowsers made of seal skin by the Esquimaux are in great request among the whale-fishers for preserving them from oil and wet.—SCORESBY's *Arctic Regions*, vol. i. p. 510. Seals in fine weather prefer the ice to the water, and vast herds of them are frequently found lying on the field ice; the places where they are met with being thence called "seal meadows." The seal hunters endeavor to surprise them while sleeping, and to intercept their retreat to the water. They attack them with muskets and bludgeons, but principally the latter, they being easily dispatched by a blow on the nose. The seal-fishery has long been prosecuted to a considerable extent in the Northern seas by ships from the Elbe and the Weser. But very few ships have been sent out for *sealing* only from England, though occasionally some of the whale-ships have taken large quantities of seals. Latterly, however, the seal-fishery has been prosecuted on a large scale, and with extraordinary success, by vessels of from 60 to 120 tons each, having crews of from 16 to 30 men, fitted out from the ports of Newfoundland, Nova Scotia, etc. The business is attended with a good deal of risk, and instances frequently occur of the vessels being crushed to pieces by the collision of the fields of ice. We borrow the following details from Mr. Bliss's tract on the *Trade, Statistics, etc., of Canada and North American Possessions:*

"There is another department of the colonial fishery which has originated within no distant period, and is now of great extent and importance. The large fields of ice which, in the months of March and April, drift southward from the Polar seas, are accompanied by many herds of seals; these are found sleeping in what are called the seal meadows of the ice, and are there attacked and slaughtered in vast numbers. For this purpose the fishers of Newfoundland, from which island these voyages are principally made, without waiting till the return of spring shall have opened their harbors, saw channels through the ice for their vessels, and set sail in quest of those drifting fields, through the openings of which they work a passage, attended with great difficultics and dangers, till they encounter their prey on the seal meadows. This bold and hazardous enterprise seems well compensated by its success. The number of seals thus taken is almost incredible, and is greatly on the increase" (p. 70).—*Living Age*, xxvii. 186. *See articles* FISHERIES, OILS, NEWFOUNDLAND, and LABRADOR; *see also* M'GREGOR's *British America*, 2d edit., and SABINE's *American Fisheries*. There is a good account of the seal in LAING's *Voyage to Spitzbergen*.

Sealing-wax (Ger. *Siegellack;* Fr. *Cire d'Espagne, Cire à cacheter;* It. *Cera Lacca, Cera di Spagna;* Sp. *Lacre;* Russ. *Surgutsch*), the wax used for sealing

letters, legal instruments, etc. It is a composition of gum-lac, melted and incorporated with resin, and afterward colored with some pigment, as vermilion, verditer, ivory black, etc.

The Hindoos from time immemorial have possessed the resin lac, and were long accustomed to use it for sealing manuscripts before it was known in Europe. It was first imported from the East into Venice, and then into Spain; in which country sealing-wax became the object of a considerable commerce, under the name of Spanish wax.

If shell-lac be compounded into sealing-wax immediately after it has been separated by fusion from the palest qualities of stick or seed lac, it then forms a better and less brittle article than when the shell-lac is fused a second time. Hence sealing-wax rightly prepared in the East Indies, deserves a preference over what can be made in other countries, where the lac is not indigenous. Shell-lac can be restored in some degree, however, to a plastic and tenacious state by melting it with a very small portion of turpentine. The palest shell-lac is to be selected for bright-colored sealing-wax, the dark kind being reserved for black.

Seamen, the individuals engaged in navigating ships, barges, etc., upon the high seas. Those employed for this purpose upon rivers, lakes, or canals are denominated watermen.

Of the Rights and Duties of Seamen.—The seamen employed in the merchant service are made subject to special regulations prescribed by acts of Congress. Shipping articles are contracts in writing or in print, declaring the voyage and the term of time for which the seamen are shipped, and when they are to render themselves on board; and the articles are to be signed by every seaman or mariner on all voyages from the United States to a foreign port; and, in certain cases, to a port in another State other than an adjoining one. If there be no such contract, the master is bound to pay every seaman who performs the voyage the highest wages given at the port for a similar voyage within the next three preceding months, besides forfeiting for every seaman a penalty of twenty dollars.

The seamen are made subject to forfeitures if they do not render themselves on board to the contract, or if they desert the service; and they are liable to summary imprisonment for desertion, and to be detained until the ship be ready to sail. If the mate and a majority of the crew, after the voyage is begun, but before the vessel has left the land, deem the vessel unsafe, or not duly provided, and shall require an examination of the ship, the master must proceed to, or stop at, the nearest or most convenient port, where an inquiry is to be made, and the master and crew must conform to the judgment of the experienced persons selected by the district judge, or a justice of the peace. If the complaint shall appear to have been without foundation, the expenses and reasonable damages to have been ascertained by the judge or justice are to be deducted from the wages of the seamen. But if the vessel be found or made seaworthy, and the seamen shall refuse to proceed on the voyage, they are subjected to imprisonment until they pay double the advance made to them on the shipping contract. Fishermen engaged in the fisheries are liable to like penalties for desertion; and the fishing contract must be in writing signed by the shipper and the fishermen, and countersigned by the owner.

The articles do not determine exclusively who are the owners, and the seamen may prove by other documents the real and responsible owners. The object of the articles is to place the crew of a fishing vessel upon a footing with seamen in the merchant service, and to make them liable to the same restrictions, and entitled to the same remedies. Provision is made for the prompt recovery of seamen's wages, of which one-third is due at every port at which the vessel shall unload and deliver her cargo before the voyage be ended; and at the end of the voyage the seamen may proceed in the District Court by admiralty process against the ship, if the wages be not paid within ten days after they are discharged. The seamen having like cause of complaint, may all join in one suit, and they may proceed against the vessel within the ten days, if she be about to proceed to sea; but this remedy *in rem* does not deprive the seamen of their remedy at common law for the recovery of their wages.

Every ship belonging to a citizen of the United States, of the burden of 150 tons or upward, and navigated by six or more persons, and bound from any port in the United States to any port in the West Indies, shall be provided with a medicine-chest, properly supplied with fresh and sound medicines; and, if bound on a voyage across the Atlantic Ocean, with requisite stores of water, and salted meat, and wholesome shipbread, well secured under deck. A fund shall be raised out of the mariners' wages earned on board of any vessel of the United States, and be paid by the master to the collector of the port, on entry from a foreign port, at the rate of twenty cents per month for every seaman. The like assessment is to be made and paid on the new enrollment and license for carrying on the coasting trade, and also by persons navigating boats and rafts on the Mississippi. The moneys so raised are to be expended for the temporary relief of sick and disabled seamen in hospitals and other proper institutions established for such purpose; and the surplus moneys, when sufficiently accumulated, shall be applied to the erection of marine hospitals for the accommodation of sick and disabled seamen. The hospitals, as far as it can be done with convenience, are to receive sick foreign seamen on a charge of seventy-five cents per day, to be paid by the master of the foreign vessel.

And to relieve American seamen who may be found destitute in foreign places, it is the duty of the American consuls and commercial agents to provide for those who may be found destitute within their consular districts, and for their passages to some port in the United States, in a reasonable manner, at the expense of the United States; and American vessels are bound to take such seamen on board at the request of the consul, but not exceeding two men to every hundred tons burden of the ship, and transport them to the United States on such terms, not exceeding $10 for each person, as may be agreed on. So, if an American vessel be sold in a foreign port, and her company discharged, or a seaman be discharged with his consent, the master must pay to the consul or commercial agent three months' pay over and above the wages then due for every such seaman, two-thirds of which is to be paid over to every seaman so discharged, upon his engagement on board of any vessel to return to the United States, and the remaining third to be retained for the purpose of creating a fund for the maintenance and return of destitute American seamen in such foreign ports.

The master is personally responsible in damages for any injury or loss to the ship or cargo by reason of his negligence or misconduct. He has authority to imprison, and also inflict reasonable corporeal punishment, upon a seaman for disobedience to reasonable commands, or for disorderly, riotous, or insolent conduct. If the correction be excessive or unjustifiable, the seaman is sure to receive compensation for damages on his return to port in an action at common law. And it must be an extreme case that will justify a master to confine a seaman in a common jail in a foreign port. He can not do it as a punishment, but only by way of precaution under existing circumstances. The master may also confine a passenger who refuses to submit to the necessary discipline of the ship. The master has also the right to discharge a seaman for just causes, and put him ashore in a foreign country; but the causes must be not slight, but aggravated; such as habitual disobedience, mutinous conduct, theft, or

habitual drunkenness; and be is responsible in damages if he discharge him without just cause. This power of discharge extends to the mate and subordinate officers as well as the seamen. But it would require a case of flagrant disobedience, or gross negligence, or palpable want of skill, to authorize a captain to displace a mate, who is generally chosen with the consent of the owners, and with a view to the better safety of the ship and the security of their property.

The master must receive back a seaman whom he has discharged, if he reports and offers to return to his duty and make satisfaction; and if the master refuses, or the seaman has been unduly discharged, he may follow the ship, and recover his wages for the voyage, and his expenses for his return. The master subjects himself to fine and imprisonment if, without justifiable cause, he maliciously force an officer or mariner on shore while abroad, or leaves him behind in any foreign port or place, or refuses to bring home those whom he took out, and are in a condition and willing to return. The expense of curing a sick seaman in the course of the voyage is a charge upon the ship in the nature of additional wages during sickness.

The act of Congress requires that in seamen's shipping articles the voyage and the term of time for which the seamen may have shipped be specified. The regulation relates to voyages *from* a port in the United States, and it does not apply to a voyage commencing from a foreign port to the United States. The voyage within the attention of the statute means one having a definite commencement and end. The *terminus a quo* and the *terminus ad quem* must be stated precisely; and in a case of general adventure the term of service must be specified. A voyage from New York to the Curacoa and elsewhere means, in shipping articles, a voyage from New York to Curacoa, and the word *elsewhere* is rejected as being void for uncertainty. Seamen in the merchant service are usually hired at a certain sum, either by the month or for the voyage. In the fishing trade the seamen usually serve under an engagement to receive a portion of the profits of the adventure. The share or profits of the voyage are a substitute for regular wages, and the act of Congress (19th June, 1813) extends the admiralty jurisdiction to the cognizance of suits for shares in whaling voyages in the same form and manner as in ordinary cases of wages in the merchant service. Every seaman engaged to serve on board a ship is bound, from the nature and terms of the contract, to do his duty in the service to the utmost of his ability; and, therefore, a promise made by the master when the ship is in distress, to pay extra wages as an inducement to extraordinary exertion, is illegal and void. It would be the same if some of the crew had deserted, or were sick, or dead, or peculiar efforts became requisite; for the general engagement of the seamen is to do all they can for the good of the service under all the emergencies of the voyage.

A seaman is entitled to his whole wages for the voyage, even though he be unable to render his service by sickness or bodily injury happening in the course of the voyage, and while he was in the performance of his duty. He will equally be entitled to his wages to the end of his voyage when wrongfully discharged by the master in the course of it. The marine law distinguishes between the cases in which seamen's services are not rendered in consequence of a peril of the sea, and in which they are not rendered by reason of some illegal act, or misconduct, or fraud, of the master or owner interrupting and destroying the voyage. In the latter cases the seamen are entitled to their wages. If a seaman be wrongfully discharged on the voyage, the voyage is then ended with respect to him, and he is entitled to sue for his full wages for the voyage.

Freight is the mother of wages, and if no freight be earned no wages are due; but the freight must not be lost by the fraud or wrongful act of the master. The rule applies to cases of loss of freight by a peril of the sea. Seamen's wages in trading voyages are due *pro rata itineris*. If the seaman dies on the voyage, it was decided in the Circuit or District Court of the United States in Pennsylvania that the representatives were entitled to full wages to the end of the voyage; and on the other hand, in the District Court of South Carolina and Massachusetts, it was decided that full wages by marine law meant only full wages up to the death of the mariner. As the payment of wages depends, in general, upon the earning of freight, if a ship delivers her outward cargo, and perishes on her return voyage, and the outward freight be earned, the seamen's wages on the outward voyage are consequently due.

By the custom of merchants, seamen's wages are due at every delivering port, and their wages are not affected, without their special agreement, by any stipulation between the owners and the charterers, making the voyages out and home one entire voyage, and the freight to depend on the accomplishment of the entire voyage out and in. The owners may waive or modify their claim to freight as they please, but their acts can not deprive the seamen, without their consent, of the rights belonging to them by the general principles of the marine law. They are entitled to wages not only when the owner earns freight, but when, unless for his own act, he may earn it. The wages are due by an arrival at a port of destination, when no cargo is on board, or when the owner chooses to bring the cargo back again, and when the port of destination be not, in fact, the port of delivery. Even if the ship perishes on the outward voyage, yet, if part of the outward freight has been paid, the seamen are entitled to wages in proportion to the amount of the freight advanced, for there is an inseparable connection between freight and wages. In case of capture, the seamen taken prisoners by the captor and detained are entitled to their wages for the whole voyage, if the same be afterward performed, with a ratable deduction for the expenses of salvage. The same is the case of a vessel captured and afterward ransomed, and enabled to arrive at her port of destination. In the case of shipwreck, if any proportion of freight be paid for the cargo saved, wages of seamen are to be paid in the same proportion.

Mariners are bound to contribute out of their wages for embezzlements of the cargo, or injuries produced by the misconduct of any of the crew. But the circumstances must be such as to fix the wrong upon some of the crew; and then, if the individual be unknown, those of the crew upon whom the presumption of guilt rests stand as sureties for each other, and they must contribute ratably to the loss. Where the embezzlement has arisen from the fault, fraud, connivance, or negligence of any of the crew, they are bound to contribute to the reparation of the loss, in proportion to their wages. Where no reasonable presumption is shown against their innocence, the loss must be borne exclusively by the owner or master.

In case of shipwreck, and there be relics or materials of the ship saved, the seamen by whose exertions part of a vessel had been saved are allowed the payment of their wages, as far as the fragments of the materials would form a fund, although there was no freight earned by the owners. But in such cases where the voyage is broken up by *vis major*, and no freight earned, no wages *eo nomine* are due; and the equitable claim which seamen may have upon the remains of the wreck is rather a claim to salvage than a title to wages. Wages in such cases would be contrary to the principle of marine law—that freight is the mother of wages, and the safety of the ship the mother of freight. If, however, the seamen abandon the wreck of a ship, as being a hopeless case, and without the intention of returning to possess and save it, they lose their lien or privilege for any equitable compensation, whether as wages or salvage—their claim is extinguished; and

though other persons may possess the property which had been derelict, it belongs to the original owner, burdened for their claim for salvage.

By the act of Congress, one-third of seamen's wages is due at the port where the ship unlades and delivers her cargo, unless there be an express stipulation to the contrary; and when the voyage is ended, and the cargo or ballast is fully discharged, the wages are due, and if not paid within ten days thereafter, admiralty process may be instituted. But there is no fixed period of time within which mariners must proceed to enforce lien for wages. It does not, like other liens, depend upon possession. The seamen need not libel the vessel at the intermediate port at which they are discharged. They may disregard bottomry bonds, and pursue their liens for wages afterwards, even against a subsequent *bona fide* purchaser. It follows the ship and its proceeds, into whose hands soever they may come by title or purchase. Their demand for wages takes precedence of bottomry bonds, and is preferred to all other demands. Their claim is a sacred lien, and as long as a single plank of the ship remains the sailor is entitled, as against all other persons, to the proceeds as a security for his wages. The seamens' lien exists to the extent of the whole compensation due them. There is no difference between the case of a vessel seized abroad, and restored in specie or in value; the lien reattaches to the thing, and to whetever is substituted for it. Desertion from the ship without just cause, or the justifiable discharge of a seaman by the master for bad conduct, will work a forfeiture of the wages previously earned. Desertion is accompanied with a forfeiture of all the wages that are due; and whatever unjustifiable conduct will warrant the act of the master in discharging a seaman during the voyage, will equally deprive the seaman of his wages. But the forfeiture is saved if the seaman repents, makes compensation or offer of amends, and is restored to his duty.

The master has power to remit a forfeiture, and the penalty of forfeiture is not applied to slight faults, either of neglect or disobedience. There must either be an *habitual* neglect, or disobedience, or drunkenness, or else a single act of gross dishonesty, or some other act of a heinous and aggravated nature, to justify the discharging a seaman in a foreign port, or the forfeiture of wages; nor will the admiralty courts, except in case of great atrocity, visit the offenses of seamen with the accumulated load of forfeiture of wages and compensation in damages. They stop at the forfeiture of wages antecedently earned; and in the application of forfeiture the advance wages are made a charge on the forfeited wages, but the hospital money is apportioned ratably on the wages for the whole voyage. If the seaman quits the ship involuntarily, or is driven ashore by reason of cruel usage, and for personal safety, the wages are not forfeited. On the other hand, it is the duty of the seamen to abide by the vessel as long as reasonable hope remains; and if they desert the ship under circumstances of danger or distress from perils of the sea, when their presence and exertions might have prevented damage, or restored the ship to safety, they forfeit their wages, and are answerable in damages. And even when a seaman might well have been discharged in the course of the voyage for gross misbehavior, if the master refuses to discharge him, and leaves him in imprisonment abroad, he will in that case be entitled to his wages until his return to the United States, after deducting from the claim his time of imprisonment.—Leone Levi's *Com. Law of the World*, vol. ii. p. 226. See *Mercantile Guide*, London, 8vo; *Am. Whig Rev.*, ii. 230. Relief of Destitute Seamen.—By the fourth section of the act of Congress, 28th February, 1803, it is made the duty of consular officers to provide for the mariners of the United States who may be found destitute within their districts sufficient subsistence and passage to the United States, in the most reasonable manner, at the expense of the United States, subject to such instruction as the Secretary of State shall give; and the section also provides for the manner in which such mariners are to be transported to the United States. If any seaman happens at a United States consulate, not from discharge from a vessel, but from shipwreck

or otherwise, the same must be stated accordingly, with the time he arrived at the consulate, so that the return will show how and when each relieved seaman happened there. And if no extra wages are received, the reasons why such wages have not been received should appear from the return, or other accompanying papers.

When American seamen are discharged in any port from sickness or any other cause, the three months' extra wages should invariably be exacted as required by the acts of February 28, 1803, and of August 18, 1856. The three months' extra wages are to be credited in consular accounts, and the two-thirds thereof are not to be paid to seamen until they shall have engaged on board some vessel to return to the United States; and then only when no disbursements shall have been made on their account. Expenses incurred for them are first to be paid, and the balance only, if any, to be returned them. On payment of the two months' extra wages to seamen, consular officers will take and forward receipts with their accounts. Whenever a ship or vessel belonging to a citizen of the United States is sold in a foreign country, and her company discharged, or when a seaman or mariner, a citizen of the United States, is with his own consent discharged in a foreign country, it is the duty of the master or commander to produce to the consular officer the certified list of his ship's company, and pay to such consular officer for every seaman or mariner so discharged, being designated on such list as a citizen of the United States, three months' pay, over and above the wages which may then be due to such mariner or seaman; two-thirds thereof to be paid by such consular officer to each seaman or mariner so discharged, upon his engagement on board of any vessel to return to the United States, and the other remaining third to be retained for the purpose of creating a fund for the payment of the passages of seamen or mariners, citizens of the United States, who may be desirous of returning to the United States, and for the maintenance of destitute American seamen.

Whenever any seaman or mariner of any vessel of the United States deserts such vessel, the master or commander of the vessel is required to note the fact and date of the desertion on the list of the crew, and to have the same officially authenticated at the port or place of the consulate or commercial agency first visited by the vessel after such desertion. If the desertion shall have occurred in a foreign country, or if, in such case, the vessel shall not visit any place where there is any consulate or commercial agency before her return to the United States, or if the desertion shall have occurred in the United States, the fact and time of desertion shall be officially authenticated before a notary public immediately at the first port or place where such vessel arrives after the desertion. All wages that may be due to such seaman or mariner, and whatever interest he may have in the cargo of such vessel, shall be forfeited to and become the property of the United States, and paid over for their use to the collector of the port where the crew of such vessel are accounted for as soon as the same can be ascertained, first deducting therefrom any expense which may necessarily have been incurred on account of such vessel in consequence of such desertion. In settling the account of such wages or interest, no allowance or deduction shall be made, except for moneys actually paid, or goods at a fair price supplied, or expenses incurred to or for such seaman or mariner, any receipt or voucher from or arrangement with such seaman or mariner to the contrary notwithstanding.

Upon the application of any seaman or mariner for a discharge, if it shall appear to the consular officer that he is entitled to his discharge under any act of Congress, or according to the general principles or usages of maritime law as recognized in the United States, he is required to discharge such seaman or mariner, and require from the master or commander of the ship or vessel from which such discharge shall be made the payment of three months' extra wages, as provided by the act approved February 28, 1803; and it shall be the duty of such master or commander to pay the same, and no such payment, or any part thereof, shall be remitted in any case, except such as are mentioned in the preceding section, and in cases of wrecked or stranded ships or vessels, or ships or vessels condemned as unfit for service, when no payment of extra wages shall be required. The extra wages required to be paid by the foregoing clause of this section are applicable to the same purposes and in the same manner as is directed by the act approved February 28, 1803, in regard to the extra wages required to be paid by that act.

If the first officer, or any officer and a majority of the crew, of any vessel make complaint in writing that she is in an unsuitable condition to go to sea, because she is leaky, or insufficiently supplied with sails, rigging, anchors, or any other equipment, or that the crew is insufficient to man her, or that her provisions, stores, and supplies are not, or have not been during the voyage, sufficient and wholesome, thereupon, in any of these or like cases, the consular officer of the port is required to appoint two disinterested competent practical men, acquainted with maritime affairs, to examine into the causes of complaint, who must, in their report, state what defects and deficiencies, if any, they find to be well founded, as well as what, in their judgment, ought to be done to put the vessel in order for the continuance of her voyage.

By the 4th section of the act of February 28, 1803, all masters and commanders of vessels belonging to citizens of the United States, and bound to some port of the same, are required and enjoined to take on board their ships or vessels, at the request of the consular officers, such American seamen as may be found in their districts respectively, and to transport them to the port in the United States to which such ships or vessels may be bound, on such terms, not exceeding ten dollars for each person, as may be agreed upon between the said masters and consular officers. And the said seamen shall, if able, be bound to do duty on board such ships or vessels according to their several abilities. To enable the master of the vessel to obtain the payment specified, the consular officer will give him a certificate, stating the names of the seamen placed on board, and the amount to be paid for their passage; on which, upon the arrival of the vessel in a port of the United States, an indorsement must be made by the collector of the customs at such port, stating that such seamen have arrived in said vessel in his district. When the certificate so indorsed is received at the Treasury Department, the amount will be paid to its holder. No master or captain of any ship or vessel is obliged to take a greater number than two men to every one hundred tons burden of the said ship or vessel on any one voyage.

Wages of Seamen.—The general rule in regard to the wages of seamen is, that such wages on board of merchant ships are payable out of the earnings for freight; and if no freight is earned, by reason of the perils of the sea or capture by the enemy, and not by the fault or neglect of the master or owner, no wages are due. The maxim that "freight is the mother of wages" is a formula which, though it has obtained general currency, is to be carefully scrutinized in its application. A distinction is to be made between those accidents by which the voyage is interrupted and the freight lost, without the fault of the owner or master, and other causes arising from the acts of the owner or master. If the voyage or freight be lost by the negligence, fraud, or misconduct of the owner or master, or voluntarily abandoned by them; if the owner has contracted for freight upon terms or contingencies differing from the general rules of the maritime law; or, if he has chartered his ship to take a freight at a

foreign port, and none is to be earned on the outward voyage—in all these cases the mariner is entitled to wages, notwithstanding no freight has accrued. Where freight is, *or might be*, earned, wages are due for the full period of employment in the ship's service, whether the freight is actually received by the owner or not. No private contract between the owner and the shipper, with regard to freight, can affect the right to wages.

If the vessel and cargo are lost on the outward voyage, before any freight is earned, and no part of either is saved by the crew, the wages of the seamen are also lost, and the original contract therefor is annulled, but the advance wages are not in such case to be returned. If the vessel is lost on the homeward voyage, and freight has been, or might have been, by the general principles of law, earned to an outward port, the wages for the outward voyage to that port are deemed to have been earned. No abatement is to be made from the wages in case of the freight being partially lost or diminished by maritime accidents or perils. If freight is earned, whether it be large or small, the whole wages, which are deemed to have been earned, are to be paid without deduction. When the vessel is lost between intermediate ports, the wages are to be calculated up to the last port of the delivery or receipt of cargo, and for half the time that the ship lies there. Where a voyage is divided by various ports of delivery, a claim for proportional wages attaches at each of such ports of delivery upon safe arrival; and all attempts to evade or invade that title, by renunciations obtained from the mariners without any consideration, by collateral bonds, or by contracts inserted in the body of the shipping articles, not usual, not fully explained to these illiterate and inexperienced persons, are ineffectual and void.

Protection and Care of Seamen.—It is provided by the 16th section of the act of July 20, 1840, that the crew of any vessel shall have the fullest liberty to lay their complaints before the consular officer in any foreign port, and shall in no respect be restrained or hindered therein by the master or any officer, unless some sufficient and valid objection exist against their landing; in which case, if any mariner desire to see the consular officer, it shall be the duty of the master to acquaint him with it forthwith, stating the reason why the mariner is not permitted to land, and that he is desired to come on board; whereupon it shall be the duty of such officer to repair on board and inquire into the causes of the complaint, and proceed therein as the act directs.

Desertion.—In countries with which the United States have stipulations by treaty or convention to authorize it, or where it is permitted by the local authorities, consular officers may apprehend deserters as fugitives from justice, and imprison them until required by their commander.—*Consular Regulations*, United States, 1856.

For further information upon the rights and duties of seamen, *see articles* AFFREIGHTMENT, CHARTER-PARTY, COMMERCE, INSURANCE, SHIPPING, etc. *See also* KENT'S *Com.* vol. iii. p. 231; PARSONS'S *Mercantile Law*, p. 385; DUNLAP'S *Digest of the Laws of the U. S.*

Seaworthy, a term applied to a ship, indicating that she is in every respect fit for her voyage. It is provided in all charter-parties that the vessel chartered shall be "tight, stanch, and strong, well appareled, furnished with an adequate number of men and mariners, tackle, provisions, etc." If the ship be insufficient in any of these particulars, the owners, though ignorant of the circumstance, will be liable for whatever damage may, in consequence, be done to the goods of the merchant; and if an insurance have been effected upon her, it will be void. But whether the condition of seaworthiness be expressed in the charter-party or not, it is always implied. "In every contract," said Lord Ellenborough, "between a person holding himself forth as the owner of a lighter or vessel ready to carry goods for hire, and the person putting goods on board, or employing his vessel or lighter for that purpose, it is a term of the contract on the part of the lighterman or carrier *implied by law*, that his vessel is tight, and fit for the purpose for which he offers and holds it forth to the public; it is the immediate foundation and substratum of the contract that it is so. *The law presumes a promise to that effect on the part of the carrier, without any actual proof;* and every reason of sound policy and public convenience requires that it should be so."

A ship is not seaworthy unless she be provided with all the documents or papers necessary for the manifestation of the ship and cargo. Neither is she seaworthy, if, during war, she be not supplied with the sails required to facilitate her escape from an enemy. "It is not sufficient to defeat the liability of the owner that he did not know that the ship was *not* seaworthy, for he ought to have known that she was so at the time he chartered her. The sufficiency of the ship is the foundation of the contract between the parties, and a ship not capable of conveying the goods in a proper state is a failure of the condition precedent to the whole contract. The seaworthiness of the ship is not a question of fraud or good intention, but it is a positive stipulation that the ship shall be so; and therefore, although the owner may himself have been deceived by the ship-builder, repairer, etc., if the vessel be, in fact, unseaworthy, have an insufficient bottom or unsound timbers, it is a breach of a preliminary condition, and is fatal, as such, to the contract."—HOLT'S *Law of Shipping.* It is only necessary, to guarantee the owners from loss, that the ship should be seaworthy at the time of her departure. She may cease to be so in a few hours, and yet they may not be liable. The question to be decided in such cases always is, whether the ship's disability arose from any defect existing in her *before* her departure, or from a cause which occasioned it *afterward.* But if a ship, within a day or two of her departure, become leaky or founder at sea, or be obliged to put back, without any visible or adequate cause to produce such an effect—such as the starting of a plank or other accident, to which the best ships are liable, and which no human prudence can prevent—the fair presumption is that she was not seaworthy when she sailed; and it will be incumbent on the owners to show that she was seaworthy at that time. They are liable for damage occasioned by every injury arising from any *original defect* in the ship, or from bad stowage; but they are not liable for any injury arising from the act of God, the king's enemies, or the perils of the sea.

It is further to be observed, that how perfect soever a ship may be, yet if, from the nature of her construction, or any other cause, she be incapable of performing the proposed voyage, with the proposed cargo on board, she is not seaworthy. *She must be in all respects fit for the trade in which she is meant to be employed.* And it is a wholesome rule that the owners should be held to a pretty strict proof of this. It has been already observed that any defect in point of seaworthiness invalidates an insurance upon a ship. There is not only an express but an implied warranty in every policy that the ship shall be "tight, stanch, and strong, etc.;" and the reason of this is plain. The insurer undertakes to indemnify the insured against the *extraordinary and unforeseen perils of the sea;* and it would be absurd to suppose that any man would insure against those perils, but in confidence that the ship is in a condition to encounter the *ordinary perils* to which every ship must be exposed in the usual course of the proposed voyage.

"In many ports certain equipments would now be considered essential which at an earlier period were not customary on the same voyages. Seaworthiness is to be measured by the standard in the ports of the country to which the vessel belongs, rather than that in the port or country where the insurance was made. * * * A vessel may be seaworthy while lying in port

for the purposes to which she is to be there applied, when she would not be for the voyage, and she may be seaworthy for one voyage and not for another. It is sufficient if she be seaworthy for the voyage when she sails. The general rule is, that the vessel must be seaworthy at the commencement of the risk, whatever that risk may be, in order to make the policy attach and charge the insurer. It was held, in the case of *Wier* vs. *Aberdeen*, that though a ship be unseaworthy at the commencement of the risk, yet, if the defect be cured before a loss, a subsequent loss is recoverable under the policy. The argument of Lord Tenterden in favor of this doctrine is very weighty, but a doubt seems to have been thrown over its solidity by the Supreme Court of the United States.—See *M'Lanahan* vs. *The Universal Insurance Co.*;" KENT's *Com.* vol. iii. p. 364.

For further information upon this subject the reader is referred to the able and excellent work of Chief-justice Abbot (Lord Tenterden) on the *Law of Shipping*, part iii.; HOLT *on Shipping*, part iii.; Mr. SERGEANT MARSHALL *on Insurance;* KENT's *Comm.* vol. iii.; and PARSONS's *Mercantile Law.*

Seeds, in *Commerce*, the grains of several species of gramina. Those of most importance are clover seed, flax or linseed, hemp seed, rape seed, mustard seed, etc.; for which see the respective articles.

Segars, or **Cigars.** *See* TOBACCO.

Seizure, in *Commerce*, the arrest of some merchandise, movable, or other matter, either in consequence of some law, or some express order of the sovereign. Contraband goods, those fraudulently entered, or landed without entering at all, or at wrong places, are subject to seizure.

Senegal and Dependencies. Gorée is the only port which foreign vessels are permitted to enter. Vessels of the United States pay a duty of 18¾ cents per ton. By decree of January 6, 1855, foreign vessels visiting Gorée are subject to a duty of 50 centimes per ton, about one half of a franc, or 9·3 cents. They are upon an equal footing with those of France in respect to navigation duties. Up to 1831, the exportation of gum Senegal was limited to France. By a royal ordinance of that year it is permitted to be exported to all countries from the port of Gorée only. Merchandise of every kind and of every production (Guineas or India-blue cloths excepted) can be imported into or exported from the island of Gorée by vessels of all nations, free of duty.

The name Senegal is derived from the great river of that name, and includes several small French colonies, embracing a number of little islands, and a strip of the main land between the Senegal and Gambia rivers. It is divided into a northern and a southern arrondissement. The total native population of these settlements amounted in 1836 to upward of 18,000. They are all Mohammedan and blacks. The soil of the islands is very poor. The main land, not near the shore, is fertile, and covered with forests. The climate is sultry, and extremely unhealthy. The rainy season lasts from June to October, and breeds fatal diseases. Gold is found near the sources of the Senegal, but attempts to form settlements there have proved abortive. Salt is quite abundant. The vegetable products are varied and luxuriant. There may be found the gigantic palm, the gum, mimosas, ebony, cotton, indigo, coffee, annatto, olives, hemp, cassia, sweet potatoes, millet, maize, etc. The wild animals are the elephant, lion, hippopotamus, boar, buffalo, tiger-cat, deer, and an immense variety of birds. Oxen, goats, mules, horses, and asses are used for domestic purposes, and sheep and hogs are bred.

The articles of export are raw hides, wax, elephant teeth, gum Senegal, cabinet woods, and gold. The value of the exports, including goods re-exported, is about $1,300,000; and the value of the imports is about $2,350,000. The imports are chiefly linen and cotton goods, ready-made clothing, brandy, liquors, wines, and some provisions.

Senna (Fr. *Sné*; Germ. *Sennablater*; It. *Senna*; Sp. *Sen*; Lat. *Cassia Senna*; Arab. *Suna*). The plant (*Cassia Senna*) which yields the leaves known in commerce and the *materia medica* by the name of senna is an annual, a native of Upper Egypt, and Bernou in Central Africa. The senna, after being collected in Upper Egypt, is packed up in bales and sent to Boullac, where it is mixed with other leaves, some of which are nearly equally good, while others are very inferior. After being mixed, it is repacked in bales at Alexandria, and sent to Europe. A great deal of senna is imported from Calcutta and Bombay, under the name of East India senna; but it is originally brought to them from Arabia.—THOMSON's *Dispensatory.* Senna is very extensively used in medicine.

Sequ.., a gold coin struck at Venice, and in several parts of the Grand Seignior's dominions. In Turkey it is called *dahob*, or piece of gold, and, according to Volney, is in value about 8*s.* 6*d.* sterling. It varies, however, considerably in its value in different countries. At Venice it is equal to about 9*s.* 2*d.* sterling.

Sewing Machines, a recent French invention for stitching. The piece of cloth is laid down flat upon a cushion; the seamstress who works the machine sits at a kind of lathe, on which the cushion is laid, and works a treadle with her foot; at each movement of the treadle a needle descends vertically and pierces the cloth, carrying with it a thread; the needle has a small hook or notch on one side, which catches and brings up a thread on its return from the hole; and thus, two or three hundred times in a minute, a thread becomes interlaced in the manner of "chain-stitch," or "tambour work." The machine, which costs twenty or thirty guineas, can embroider as much cloth in an hour as an embroideress can complete in a day. Another French machine, by M. Seneschal, of Paris, is more complex in its construction, and is intended for sewing coarse cloth. Great ingenuity is shown in the arrangement of the several parts; the machine pierces its own holes, inserts its own thread, tightens the thread after insertion, and shifts the cloth as the work advances, at the rate of forty or fifty stitches a minute. Barlow's (English) patent stitching machine for making articles of dress: two distinct threads are used, one at the front and the other at the back of the fabric, so that each stitch forms an independent fastening. Judkins's (English) sewing machine, said to be "suited to sewing either a circle, curve, or straight line, at the rate of 500 stitches per minute." There are racks or toothed arms employed, straight or curved, according to the shape of the work to be done; there are two threads, one in a reel and one in a shuttle; and a needle very ingeniously entangles these threads one in another, through the holes pierced in the cloth. The United States have also contributed to the list of machines. Of Morey's sewing machine, made at Boston, the following character is given: "By a very simple process, straight and curvilinear seams are sewn in cotton, linen, or woolen cloth with great rapidity. With one attendant, it will accomplish the work of five seamstresses; it is easily wrought, is not liable to get out of repair, and is readily applicable to almost every variety of plain stitch. In the large ready-made clothing establishments in the United States it is universally used." Among the most prominent patents now in use in this country are Grover and Baker's, Wheeler and Wilson's, and Singer's.

Sextant (Lat. *sextans*, the sixth part; the limb of the instrument being the sixth part of a complete circle), an instrument for measuring the angular distances of objects by reflection. The sextant is capable of very general application; but it is chiefly used as a nautical instrument for measuring the altitudes of celestial objects, and their apparent angular distances. It is an instrument of the utmost importance in naviga-

tion. The sextant is used in the manner of a quadrant, and contains sixty degrees, or the sixth part of a circle. It is for taking the altitude of the planets, etc. Invented by the celebrated Tycho Brahe, at Augsburg, in 1550.—VINCK'S *Astronomy*. The Arabian astronomers under the califs are said to have had a sextant of fifty-nine feet nine inches radius, about A.D. 995.—ASHE.

Shagreen (Ger. *Schagrin;* It. *Chagrin;* Russ. *Schagrim Schagren*), a kind of grained leather, used for various purposes in the arts. It is extensively manufactured at Astrakhan, in Russia.—*See* TOOKE'S *Russia*, vol. iii. p. 403.

Shallop, or **Sloop**, is a light vessel, with only a small mainmast or foremast, and lug-sails to haul up and let down on occasion. Shallops are commonly good sailers, and are therefore often used as tenders upon men-of-war.

Shammy, or **Chamois Leather** (Ger. *Sämischleder;* Fr. *Chamois;* It. *Camoscio;* Russ. *Swschanüi, Koshi*), a kind of leather dressed in oil, or tanned, and much esteemed for its softness, pliancy, and capability of bearing soap without hurt. The real shammy is prepared of the skin of the chamois goat. But leather prepared from the skins of the common goat, kid, and sheep is frequently substituted in its stead.

Shanghai, a city and river port of China, province of Kiang-su, on the Woosung River, 40 miles by water from the sea, and 169 miles east-southeast from Nankin; lat. 31° 12′ N., long. 120° 53′ E. Population estimated at from 115,000 to 135,000. It stands in a level and well-cultivated plain, producing good crops of cotton, rice, and wheat. Immediately outside the wall by which it is inclosed are several populous suburbs. Streets narrow and filthy. Foundling hospitals, tea-gardens, and vast ice-houses, are the objects most worthy of notice in the city. It has a Mint, with manufactures of silk, vegetable oils, and oil-cake (of which vast quantities are annually sent into the interior), iron ware, glass, paper, ivory ware, etc. This is the most northerly of the five Chinese ports opened to foreigners by the treaty of 1842, and, excepting Canton, it is also the most important. The river, which may be navigated by ships of 450 or 500 tons for a considerable distance above the town, crosses the Grand Canal, so that Shanghai is an entrepôt for all the vast and fertile country traversed by the canal, and by the great rivers, including the Yang-tse-Kiang and the Hoang-Ho, with which it is connected. Hence the present importance of the emporium, and hence, also, the indefinite extension to which its foreign trade will probably attain. Its inland and coasting trades are both very extensive. It is said to be annually visited by from 5000 to 6000 canal and river boats, some from very great distances, and by 1500 or 1600 coasting junks. The province of Kiang-su, in which Shanghai is situated, produces great quantities of silk; and besides supplying most part of the northern provinces of the empire, the shipments of silk to the foreigner are greater from this than from any other port. It is also well situated for the export of both green and black teas. Among the other exports are gold and silver, with oil and oil-cake, camphor, drugs, porcelain, cotton, cassia, alum, gypsum, coal, etc. Of the imports opium is by far the greatest; and at least 20,000 chests of Bombay (Malwa) and Patna opium are now annually disposed of in this market; which, supposing the chest to be worth $500, will represent an aggregate sum of $10,000,000, or £2,200,000 sterling, for which payment is almost invariably made in the precious metals! Sugar is extensively imported from Formosa, Canton, the Philippines, etc.; cotton stuffs, woolens, iron, etc., from England; with sandal-wood, birdsnests, *bêche de mer*, and other products of the Eastern Archipelago, etc. The inhabitants of Shanghai are much more hospitable and better disposed toward foreigners than those of Canton; and strangers may travel for miles into the interior all round the city with perfect security. Within the last four or five years, some very fine brick houses have been built by foreign merchants in the suburbs.—*Parl. Reports*, etc.

Commerce with the United States.—The commercial relations of the United States with China are regulated by the stipulations of the treaty of July 3, 1844. A treaty, similar in all its leading provisions, was negotiated with Great Britain in 1842, and a tariff of duties on imports and exports, and duties on tonnage, are made a part of both these treaties. Formerly, foreign intercourse, as already remarked, was confined to Canton, and hither were brought from the distant parts of the empire teas, silks, and other leading staples of China. Trade was invariably conducted through the intervention of *hong* merchants, who were licensed agents of the government, and answerable to it for all duties of import, export, and other charges accruing on the vessel, the affairs of which they managed. This system was adopted as a precautionary measure for securing the duties and other dues levied on foreign vessels; but the treaties referred to containing ample stipulations respecting this subject, the agency of the hong merchants has been abolished, and their duties transferred to the consuls of the nations to which the vessels respectively belong. The treaty between the United States and China guarantees the same commercial advantages and privileges to the citizens of the United States that are or shall be conceded to the citizens of any other foreign power. Fees and charges of every kind not comprehended in the treaty are abolished. Trade is permitted to the five ports of Kwang-chow, Amoy, Foo-chow, Ningpo, and Shanghai, and from either of the said ports to any other of them; but it is prohibited to any other ports in the empire, or along the coasts thereof, under a penalty of confiscation of vessel and cargo. Trade is subject to no restrictions as to origin or nature of cargo, or port of departure, with the exception of the article opium, which is declared contraband. Captains, on entering, are required to deposit their papers with the consul of their nation, who will notify the proper local authority of the name and tonnage of the vessel, names of the crew, and nature of cargo. Tonnage duty is fixed at 5 maces (equal to 74 cents) per ton, if the vessel is over 150 tons burden; 150 tons or under, 1 mace (equal to 14·8 cents) per ton. Before cargo can be landed, a permit must be obtained from the local authority, under a penalty of $500 and forfeiture of goods so landed.

Standards of weights and measures are to be supplied by the Chinese government to the consuls of the different nations, to secure uniformity, and prevent confusion in measures and weights of merchandise. The former limitation of foreign trade to hong merchants, appointed by the government, is abolished; and citizens of the United States are permitted to trade with any and all subjects of China, without distinction. The privilege is conceded of re-exporting into any other port any merchandise imported into any one of the five ports, without being subject to any additional duty, provided the full duty was paid when first imported, and the goods remain with their original marks unchanged; but this privilege must be specially applied for through the American consul. The other provisions of the treaty apply mostly to the privileges, and duties, and police regulations, applicable to the consuls, merchants, and citizens of the United States at the five ports. Shipping dues, formerly charged on the measurement of the ship's length and breadth, at so much per *chang*, and all the old charges of measurement, entrance, and port clearance fees, daily and monthly fees, etc., are also abolished by this treaty; and the tonnage duty on the registered tonnage of the vessel, specified in the preceding synopsis, is substituted in lieu thereof. Commercial relations between the United States and China date from a period as early as 1784. In the month of February of that year,

it appears that the *Empress of China*, a ship of 360 tons, sailed from New York for Canton, and returned the following year with a rich and valuable cargo. The success, as well as the novelty of this adventure, attracted no little attention throughout the country. The ensuing year another voyage was made, in a small vessel of only 84 tons burden, with equal success. Merchants were soon induced to engage in an enterprise which promised the most flattering results; and as early as 1789, five years after the American flag had first entered the Chinese seas, fifteen American ships arrived at Canton. Such was the origin of an extensive and profitable trade between the United States and the Celestial empire.

The geographical position, excellent shipping facilities, and proximity to the fertile valley of Yang-tse-Kiang, would seem to point to Shanghai as a port possessing pre-eminent advantages, which, when fully developed, must make it a flourishing and primary station. The following extract in relation to the trade of Shanghai is from an official communication addressed to the Department of State, dated Shanghai, August 7, 1855: "It will be observed that the export trade for the first six months of 1855 has more than doubled any previous one; and, inasmuch as the business season is just opening, it may safely be inferred that the value of exports for this year will be about double that of any previous one. The disorganized state of the rest of the empire, the equal and regular levy duties at this port, and its superior geographical position, are the main causes of the concentration of trade at this point. The imports have been small, because it has required some time to dispose of the enormous quantities which had collected at this port during the period the city was in possession of the rebels. That important branch of our trade will now, I believe, revive; and if our government will but vigorously and prudently nourish the facilities now enjoyed at this port, a commerce may be developed rivaling Calcutta in importance, and superior to any other port in the East. The great valley of the Yang-tse-Kiang is the commercial field, and this port is the entrepôt. The greatest privileges conceivable might be obtained at all the other ports, and yet one half of such facilities at this port would be productive of more advantage than could by any possibility be derived from all the other ports combined. Foo-chow will in time be a port of some importance for the purchase of a few black teas, but no more. Amoy and Ningpo never have furnished any thing worthy of notice; and Canton was only a port of trade, because the Chinese had been in the habit of going there to trade with foreigners when there were no other ports open. But the difficulty created by the rebellion has diverted the great mass of the trade from its ancient and out-of-the-way channel, and concentrated it here. And now that the Chinese find Shanghai to be nearer to their tea and silk districts than Canton, and that they can often get better prices, and always as good as at Canton, they will abandon their old and long route to a port of sale, and will continue to concentrate at Shanghai. This they have done last year, as well as the present; and already they have made contracts on next year's produce, deliverable at this port."

In another and later communication, it is stated that property in houses and lands, to the value of a million of dollars, is owned by American citizens in Shanghai.

Navigation and Trade.—The number and tonnage of American vessels, inward and outward, at the port of Shanghai, for the years designated, were as follows:

Years.	Inward.		Outward.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
1849	24	9,826	24	9,877
1850	37	13,308	34	14,464
1851	54	27,634	53	26,097
1852	66	38,740	70	40,592

The number of American vessels entered at Shanghai during the first six months of 1855 was 28, with an aggregate tonnage of 27,480.

The cargoes inward consisted of stone coal, sugar, drills, general merchandise, and assorted cargoes, suitable for the Chinese markets, valued at $268,997. The cargoes outward were chiefly silk and tea, valued at $1,480,198. Of the vessels inward, there were from the Atlantic ports direct, 2, with an aggregate of 1235 tons; and from the Pacific ports 13, with an aggregate of 13,839 tons. The following is a summary of the navigation and trade of the port of Shanghai with the United States during the last six months of 1855:

Number of American vessels entered, 57; measuring 27,262 tons. Number of American vessels entered from Atlantic ports, 4; measuring 1589 tons. Number of American vessels entered from Pacific ports, 10; measuring 10,632 tons. Number of American vessels entered from foreign ports, 36; measuring 13,000 tons. The returns do not give the ports of departure of seven of the American vessels entered. The number of American vessels cleared from the port of Shanghai during the same period was 57; aggregate tonnage, 30,512 tons. Of these, 13 vessels, all freighted with tea and silk, proceeded direct to New York, and the remainder to foreign ports.

During the same period, the duties paid by the American flag to the authorities at Shanghai were:

	* Tael.	Mace.	C.	C.			
Imports	19,224	6	9	5	= in U. S. currency		$28,452
Exports	456,048	7	7	1	"	"	674,952

Total	245	243

Total value of the trade of Shanghai during the last six months of 1855: Imports, $2,812,019; exports, $501,786. Total trade, $3,313,305. During the last six months of 1855 great improvements were made in the navigation of the River Woosung, on which the port of Shanghai is situated, and, from having been one of the most dangerous of access in the Pacific, it has been made one of the safest and easiest. The expense of the work ($20,000) was defrayed by the Chinese authorities. A system of pilot regulations, agreed upon by the consuls of the United States, Great Britain, and France, was ratified by the superintendent of customs, and is as follows:

Pilot Regulations.—The following rules and regulations for the government of pilots, native and foreign, at the port of Shanghai are hereby issued and made binding by his excellency Chaou, superintendent of customs, in communication with the consuls of the three treaty powers:

1st. A board shall be appointed by the three consuls, sanctioned by his excellency Chaou, consisting of not less than three, nor more than five shipmasters, with whom a naval officer shall be associated, if required, before whom all persons wishing to become pilots shall appear for examination.

2d. A certificate of competency from a majority of said board being deposited at his consulate, shall entitle the person therein named to a license as a pilot. In all cases where the nationality of the applicant is other than one of those nations in treaty with China, his certificate from the board of examiners must be deposited with the senior consul, who will obtain for him the necessary license.

3d. Every pilot-boat is to hoist a red and white flag horizontal, on which the number of his boat shall appear in black.

4th. The rates of pilotage shall be by the water the ship draws, viz.: from Gutslaff, $5 per foot; from beacon-ship, $4 per foot; from any point outside Woosung, but inside beacon-ship, $3 50 per foot; from Woosung to Shanghai, $3 per foot. The same rates of pilotage are allowed for vessels outward bound.

5th. Every pilot, on boarding a ship, shall produce, for the inspection of the master, his license as a pilot.

6th. All persons acting as pilots without a license, as hereinbefore prescribed, shall have no claim for services rendered, and shall be dealt with by their own consuls, according to law, for violating these regulations; and all such cases not coming within the jurisdiction of the three treaty consuls are to be referred to the local Chinese authorities.

7th. Pilots shall be responsible for the faithful and complete discharge of their duty; and any misconduct, either from ignorance, incapacity, willful neglect, or otherwise, being known, shall entail a forfeiture of the offender's license, in addition to any other liability he may have incurred by the laws of his own country.

8th. The foregoing regulations to take effect on and after the 10th day of December, 1855.

General Regulations.—The general regulations under which foreign trade is conducted at the five ports of Canton, Amoy, Foo-chow-foo, Ningpo, and Shanghai, are such as are usually prescribed in all well-regulated ports, and are subject to such modifications, under the treaties, as the consuls of the three nations, viz.: England, France, and the United States, may from time to time fix and determine. These regulations provide amply for all the wants of foreign commerce, and guard against extortion, unnecessary delay, or capricious embarrassments, either on the part of Chinese officials, or the captains or other officers of vessels trading at any of the five ports. To give proper sanction to, and enforce the due observance of these regulations, the consuls of the three nations, in Chinese ports, are invested with judicial as well as with the ordinary consular powers, by virtue of which they are enabled to exact strict conformity to such provisions and regulations as they may deem necessary in the maintenance of good order and the faithful fulfillment of treaty obligations. Prior to 1843, as before noted, it was the custom, when foreign vessels entered the port of Canton, that a Chinese hong merchant stood security for her, and that all duties and charges were paid through such security merchant. But the several treaties having provided for the abolition of this security system, the consuls of the different treaty nations are now substituted as security for the vessels of their respective nations entering any of the five ports. Hence one of the reasons why the powers of consuls in China should be ample, and these officers invested with full powers to control the shipping of their respective nations.

During the recent troubles in China, foreign commerce at the port of Shanghai was considerably interrupted, and the custom-house at this port was abandoned by the Chinese officials, who organized in lieu thereof two other custom-houses in the interior. An arrangement was subsequently entered into between the consuls of the three treaty powers and the Chinese authorities, by virtue of which these custom-houses were suppressed, and foreign commerce was again conducted under the usual regulations.

It may be here observed that the five ports pertain to different provincial jurisdictions, having different local administrations, and not unfrequently different commercial regulations. It is by no means rare to see, notwithstanding the treaties apply to all in common, privileges enjoyed at one which are strictly interdicted at another—perhaps at the other four. Thus, in 1855, it is stated that rice was exported to the amount of 30,000 piculs (each 133⅓ lbs.) to a vessel, free, too, of all export or other duty, save a *douceur* of 200 or 300 dollars to some subordinate; while the exportation of this article is not only forbidden at Shanghai, but the death-penalty is inflicted on such of the Chinese as are detected in violating the prohibition. The same observation applies to the emigration of coolies, which is tolerated at Amoy, but strictly forbidden at the other ports. So the importation of opium, as already stated, though illegal, is openly tolerated by Chinese officials.

The state of the currency at this port has for some time attracted attention.

A letter from the United States consul at Shanghai, under date of June —, 1855, states as follows:

"The rate of exchange here has exceeded that of Canton from 25 to 30 per cent., although the distance between the two is but 800 miles, and of easy and certain communication. Under ordinary financial rules, the difference of exchange between the two places is regulated by the cost of transportation, the insurance, and a slight per cent. for brokerage. While 2½ per cent. would be a liberal allowance on these items between this port and Canton, and Hong Kong, yet exchange has varied from 25 to 30 per cent. against this port.

"China has no currency but copper cash—one of which is equal to the sixteen-hundredth part of a dollar. All large transactions, therefore, are made in pure silver, denominated by the Chinese sycee, which is measured in taels, or a weight equivalent, when at par, to $1 58 per tael. When the foreign trade became important in China, foreign dollars were introduced; and, on account of their superior qualities as a circulating medium over the ponderous sycee, became quite popular, and were universally adopted. The Carolus dollar was the first adopted; afterward the Bolivian, Peruvian, Chilian, and Mexican; but the Carolus having been first introduced, the Chinese formed a prejudice in its favor to the extent

of a discount of 10 per cent. on all others. When this port was first opened, the Chinese received the Mexican at a premium over the Carolus, and the rupee at a premium over both; but the native brokers from Canton instilled in the traders here the same prejudice which existed where they came from, and the Carolus gradually rose in value, and the other dollars sank, until the difference has become 25 or 30 per cent., which is equivalent almost to an entire exclusion from circulation. This result was chiefly brought about by the native brokers, in conjunction with a few foreign commercial houses at this port, who have obtained the exclusive control of all the Carolus dollars that are made. The Spanish government have long since discontinued their issue, but they are made at Canton, in India, and in Mexico, though not as pure as the original dollar.

"Thus this prejudice in favor of the Carolus has been fostered by a few commercial houses, until the evil consequent upon a limited currency, and one which is becoming less and less every year, is almost beyond a remedy. The longer it is permitted to exist, the more vexatious will its remedy become. The Carolus dollar is carried into the interior to pay for teas and silks, and never returns; thus each year renders the amount of circulating medium less and less. The Carolus dollar is the standard, and, therefore, as it decreases in quantity, exchange rises. The same houses which have the control of the Carolus dollar also discount all bills of exchange, and thus hold the entire commercial machinery of this port at their control. They discount bills of exchange at whatever rates they please to fix at Canton and all the other ports in China. The foreign dollars at present circulate, according to treaty, with reference to their purity in silver as compared with sycee; but here a distinction is kept up in favor of the Carolus far above its relative value in pure silver, and against all other dollars far below theirs. Thus exchange at this port rules from 25 to 30 per cent. above any other port in China.

"The United States are great consumers of green tea, and this port supplies it. The consumer pays this extraordinary exchange on the price of tea, and thus the agent here, and the importer at home, can feel no interest in ameliorating the condition of the exchanges, as it is not their loss; but, on the contrary, as they now have control of all the circulating medium, it is to their advantage and interest to let it remain so.

"I have thus briefly endeavored to show, first, that the enormous difference of exchange at this port over any other in China is produced by a combination of native and foreign merchants; and, second, that as the United States take nearly all the green teas exported from the empire, which are all purchased at this port, and as the consumer must in the end pay all charges on the imported article, therefore the consumers of the United States are the sufferers to the full extent of this exorbitant exchange. Entertaining the conviction that it is the duty of an officer to guard and protect the interests of those whom he has the honor to represent, especially when those interests are guaranteed by the laws and treaties of the land, and not to permit the advantages of a select few to be developed at the expense of the many, I will now proceed to lay before the honorable Secretary of State the course I have pursued in giving full effect to the treaty of the United States with China in the matter of the currency. To remedy the great evil which exists at this port in relation to the currency, there appeared to be but two ways: First, a combination among the merchants that they would pay and receive all dollars alike, so far as their intrinsic value should be the same. Second, the enactment of regulations by the Chinese authorities, which would place all dollars on an equality, by their agreeing to receive them alike for all government dues. The first was impossible in a community where all are merchants possessed of as many different interests, and therefore to the second I gave my attention. The manner in which I presented this subject, and carried it through to an actual assay of the various dollars, may be fully examined by reference to the entire correspondence, which I have the honor herewith to inclose. The assay as made here differs but slightly from that made at Canton; and as there is an allowance of 1½ per cent. for difference of scales, it is more than made up.

"The whole examination of the subject proved most satisfactory to his excellency the Imperial collector of customs, and his excellency has asked for twenty days to refer the matter to his superiors, prior to carrying it into practical operation. I have therefore given notice to his excellency that on and after the 12th of July next American merchants shall be allowed to discharge all their treaty obligations at this port in foreign money, at the rates as ascertained by actual assay on the 4th instant. Great results will inevitably follow the adoption of this measure. Exchange will decline 25 or 30 per cent.—that, too, just at the opening of the business season—and will assimilate with that at Canton, plus the cost of transportation, etc., etc. The circulating medium will be in the greatest abundance. The importer in the United States will, through his agent here, realize more money on his bills of exchange, consequently he can purchase more teas and silks; and, finally, as the consumers participate alike in the advantages and disadvantages, they will be enabled to purchase teas and silks subject to the same reduction in price which the importer has enjoyed."

Currency.—The only legal coin of China is the copper cash, worth the fifteenth part of a cent; though by stipulations of the treaty of 1844 the sycee is received in payment of duties. The sycee fluctuates in price with the value of silver. The shee is worth about seventy dollars. In 1853 the American merchants residing at Shanghai addressed a memorial to the United States commissioner in China, setting forth the great inconvenience to which mercantile interests in China were subjected by the absence of an adequate circulating medium between the two extremes above named, and invoking the commissioner's aid in establishing a national Mint in that empire. To the success of such a measure the sanction and co-operation of the Chinese government are indispensable. The treaty of 1844 provides that, should experience show that any modifications hereafter become requisite in those parts which relate to commerce and navigation, the two governments will, at the expiration of twelve years from the date thereof, treat amicably concerning the same, by the means of suitable persons appointed to conduct such negotiation. The time designated will soon arrive; and should such modifications as the treaty contemplates become a subject of negotiation, the question of a national Mint, and of the currency generally, will, doubtless, demand the attention of the United States Commissioner. At Shanghai an attempt has been made by the foreign consuls to cause an official substitution of the Mexican for the Carolus dollar as the money of account.—*Com. Rel. U. S.*

From official tables it is shown, 1st. That, until the year 1850, Canton was the principal port for tea, but in that year Shanghai exported 50 per cent.; and of silk, three-fourths of the whole export was from Shanghai. 2d. That the trade of Shanghai continued to increase over that of Canton, and even Foo-chow, which derives all its trade from this emporium, until the year 1855, when Shanghai exported in tea about 80 per cent. more than both Canton and Foo-chow, and in silk almost the entire amount was furnished at Shanghai. 3d. That the grand increase of the foreign trade for twelve years is an average per annum of about 3 per cent. 4th. That the increase of silk for exportation has been, on the grand aggregate, at the rate of 8¾ per cent. per annum for the past eleven years.

It appears also, 1st. That the trade of the United States in China has increased in the last ten years 1¾ per cent. per annum. 2d. That since the year 1848 the ports of Canton and Shanghai have changed commercial positions, the latter having exported more tea the last year to the United States than the whole trade amounted to when Canton was the only port opened. 3d. That Foo-chow is now a port of more commerce with the United States than Canton, and ranks next to the most important, Shanghai. 4th. That the trade in silk to the United States has developed immensely; and as this port is the great emporium for that commodity, it will probably furnish more trade than all the others combined. 5th. That for the past year the port of Shanghai has furnished more than three-fourths of the American trade in tea, and all the silk.

Up to the year 1853, exchange was steady at from 15 to 21 per cent., but the change which followed, and the variableness which is marked, arose from the fact that the city of Shanghai being taken by the rebels on the 7th September, 1853, many large losses were incurred by the wealthy Chinese, which, creating embarrassment, engendered a lack of confidence and trust, so that money became scarce and exchange began to rise. About this time foreigners began to impose the belief on the native Chinese that the Carolus dollar was the most valuable, and at the same time secured the monopoly of all obtainable over the world, and have since been having the Mexican restamped with the Carolus dies. This latter coin does not pass well, as it is too new to the Chinese; but the old and genuine Carolus dollars are almost exhausted, and, indeed, are becoming less and less every year, while just in proportion to the supply or demand exchange rises or falls.

EXPORTS OF TEA TO ALL NATIONS FROM CHINA, FROM JUNE 30, 1850, TO JUNE 30, 1855, NOT INCLUDING THE UNITED STATES.

The commerce of China is conducted on the basis of imports, opium, and credits on London. The imports are a trifle; opium is about 30 per cent., and the difference is made up by a direct drain on Europe in pure silver and some dollars; the former is cast into sycee, or pure silver ingots, and rarely, if ever, leaves the empire, as it is strictly forbidden by the laws.—*See* CHINA, CANTON.

Sharks' Fins form a regular article of trade to China, and are collected for this purpose in every country from the eastern shore of Africa to New Guinea. In the Canton Price-currents they are as regularly quoted as tea or opium; and the price of late years has been, according to quality, from $15 to $18 per picul, equal to from 50*s.* to 60*s.* per cwt.

Shawls (Ger. *Schalen;* Fr. *Chals, Chales;* It. *Shavali;* Sp. *Scharalos*), articles of fine wool, silk, or wool and silk, manufactured after the fashion of a large handkerchief, used in female dress. The finest shawls are imported from India, where they are highly esteemed, and cost from $250 to $1500.

Cashmere Shawls.—The shawl manufacture is believed to have originated in the valley of Cashmere, the ancient Caspira, in the northwest of India, between lat. 34° and 35° N., and long. 78° and 76° E. Though not so flourishing as it once was, the manufacture is still prosecuted in this province to a very considerable extent. The shawls are the very best that are made, possessing unequaled fineness, delicacy, and warmth. They are formed of the inner hair of a variety of the common goat (*Capra hircus*), reared on the cold, dry table-land of Thibet, elevated from 14,000 to 16,000 feet above the level of the sea. The goat thrives sufficiently well in many other countries; but in the sultry plains of Hindostan it has hardly more hair than a greyhound; and though in higher latitudes the hair is more abundant, it is for the most part shaggy and coarse. It is only in the intensely cold and dry climate of Thibet that it yields the peculiarly soft woolly hair that constitutes the material of the Indian shawl. We do not, therefore, suppose that the efforts to naturalize the shawl-goat in France will turn out well. On the contrary, we believe the chances of success would be about equal were an attempt made to breed beavers in a hot country, without water, or camels in a moist country, free from heat and drought. The inner or fine wool is covered over and protected by a quantity of long shaggy hair, which is, of course, carefully separated from it before it is manufactured. The genuine shawl-wool has been imported into Europe, and the finest Edinburgh and Paisley shawls have been produced from it. But it must be admitted that shawls have nowhere been made that can come, as respects quality, into successful competition with those of Cashmere. The manufacture has been established at Delhi and Lahore for some years; but, notwithstanding it is carried on by native Cashmerians, and though the material employed be quite the same, the fabrics are said to want the fineness of those made in Cashmere, and to have a degenerated, coarse appearance. It is difficult to account for this superiority. It has been ascribed to some peculiar quality of the water in the valley of Cashmere; but it is most probably owing to a variety of circumstances, which, though each may appear of little importance, collectively give a character to the manufacture.

The following details as to the manufacture of Cashmere shawls have been extracted from an English paper published at Delhi: "The great mart for the wool of which shawls are made is at Kilghet, which is said to be a dependency of Ladak, and situated 20 days' journey from the northern boundaries of Cashmere. There are two kinds of it: that which can be readily dyed is white; the other sort is of an ashy color, which being with difficulty changed, or, at least, improved by art, is generally woven of its natural hue. About 2 lbs. of either are obtained from a single goat once a year. After the down has been carefully separated from the hairs, it is repeatedly washed with rice starch. This process is reckoned important; and it is to the quality of the water of their valley that the Cashmerians attribute the peculiar and inimitable fineness of the fabrics produced there. At Kilghet the best raw wool is sold for about one rupee a pound. By the preparation and washing referred to, it loses one half, and the remainder being spun, three rupees' weight of

the thread is considered worth one rupee. Shawls are made of various forms, sizes, and borders, which are wrought separately, with the view of adapting them to the different markets. Those sent to Turkey used to be of the softest and most delicate texture. Carpets and counterpanes are fabricated of the hair or coarser part of the wool. From a variety of causes, among others the destruction of the Janizaries, who dressed much in shawls, the loss of royalty in Cabul, and the ruined finances of Lucknow, it is certain that the demand for this elegant commodity has greatly declined of late years. Under the Mogul emperors, Cashmere found work for 30,000 shawl-looms. In the time of the Afghan kings, the number decreased to 18,000. There are now not more than 6000 employed. We should attribute little of this diminution to the sale of English imitations among the Asiatic nations. When these counterfeits first appeared, the pretty patterns and brilliancy of the colors took the fancy of some; but their great inferiority in the softness and warmth which mark the genuine shawl soon caused the new article to be neglected. The average value of shawls exported from Cashmere amounts annually to 1,800,000 rupees. Runjeet Singh took two-thirds in kind as part of the gross revenue of the province, which was about 25 lacs a year. He is said to have sold three-fourths of what he thus received, and to have kept the remainder for his own court. Of those disposed of by him and left for sale in the valley, seven lacs' worth went to Bombay and Western India; three to Hindostan, chiefly Oude; half a lac each to Calcutta, Cabul, Herat, and Balk, whence some were carried to neighboring countries. A curious calculation of the successive exactions, from Cashmere to Bombay inclusive, which magnify the price of shawls, is herewith subjoined.

"ACTUAL COST FOR MATERIALS AND LABOR IN MAKING A PAIR OF REEL SHAWLS.

	Fd.	rs.
Four Furrukabad seers of wool	12	8
Cleaning, washing, and spinning	50	0
Dyeing	11	0
Wages to weavers	264	6
Total	337	14
Duties on the same.		
On sale and importation to Cashmere	3	14
On the thread	8	4
While the fabric is in the loom	125	0
Fees to chowdries, brokers, assessors, etc.	35	0
Total amount of duties in Cashmere	171	18
Duties from Cashmere to Amritsir	12	6
" " Amritsir to Bombay	3	6½
" at Bombay	70	0
Total from Amritsir to Bombay	85	12½
Total from Kilghet to Bombay, 171 18 and 85 12½ =	252	30½
Prime cost	337	14
Proportion of carriage	0	12
Insurance	21	0
Total cost	610	56½

"A pair of such shawls might sell for 500 rupees at Amritsir, and in Bombay for 900. The amount of the imports, and the sums levied by each government, will appear more in relief if stated as they affect a camel-load in its progress. It consists of fourteen and a half cutcha maunds, and contains, at an average, 2000 shawls of different kinds, valued, on reaching Bombay, at 28,500 Furrukabad rupees.

"The government of Lahore exacts Furrukabad rupees, 1564 6; Patialah, 61 0; Dikeneer, 43 0; Joudpore, 121 4; Bhownuggur, 20 0; total levied by native princes, 1809 0; Bombay, 10 per cent. (*ad valorem*) 2850 0."

It is not as yet generally known that the Thibet goat, from whose wool the famous Cashmere shawls are made, has been introduced successfully into the United States. This enterprising undertaking was achieved a few years since, after many difficulties, by Dr. J. B. Davis, of Columbia, South Carolina, at that time employed by the Ottoman Porte in experimenting on the growth of cotton in the Sultan's dominions. Dr. Davis succeeded, at vast expense, in securing eleven of the pure breed, which, on his way home, he exhibited in London and Paris. Since that period, the goat has been introduced from South Carolina into Tennessee, where it is said to thrive. The value of a flock may be estimated from the fact that no real Thibet goat has ever been sold for less than $1000. This enormous price, moreover, is not a speculative one, for no fleeced animal has wool of such fineness, softness, and durability. The wool of all the Thibet goats in Tennessee, for example, has been engaged at New York this year at $8 50 per pound, the purchasers designing to send it to Paisley, in Scotland, in order to be manufactured into shawls.

The prices paid for the real Cashmere shawls, or those woven in India, have sometimes been almost fabulous. A full-sized shawl, such as is called in America a "long shawl," ordinarily commands in Paris or London from $500 to $5000, according to the quality. Scarfs and square shawls, being smaller, sell for less. It is a mistake, however, to suppose that all these shawls are manufactured in India in the shape in which they are sold here. Generally, indeed, the centres and borders come out separately, and are put together afterward in sizes, and often patterns, to suit purchasers. Moreover, a large portion of the shawls sold as real India ones are actually made in France, for the Thibet goat was introduced into that country more than thirty years ago, and the Cashmere shawls imitated with considerable skill. Judges of the article pretend to say, however, that the real India shawl can be detected by its having a less evenly woven web, as also from its brighter colors. It is likewise said that the border of the genuine Cashmere shawls is invariably woven in small pieces, which are afterward sewed together, as the whole border is subsequently sewn on to the centre. But other authorities deny that . skill of India is insufficient to *broche* a shawl; in other words, to weave the border and centre in one piece, or run the pattern of the former over the latter.

Notwithstanding the successful imitation of these shawls, fashion and luxury still prefer the apparently original. Just as laces, woven by hand, bring a price more than five times as great as the same pattern woven by machinery, so a Cashmere shawl, known to have come from India, will fetch vastly more than the cleverest imitation. Probably, however, this is not all. Persons familiar with both the article and the imitation assert that the former is softer than the latter, and that this softness arises partly from the way the thread is spun, and partly because the Thibet goat, when exported from its native hills, sensibly deteriorates. There is also a shawl popularly known as the French Cashmere, which is an imitation of the imitation; but this has none or very little of the wool of the imported Thibet goat. The animal from which this valuable fleece is taken is a hardy creature, at least in its original locality; and their fine curled wool lies close to the skin, just as the under hair of the common goat lies under the upper hair.

The importation of shawls, manufactured all or in part from wool, into the United States for the year ending June 30, 1857, was as follows:

Whence imported.	Value.
Hanse Towns	$218,387
England	732,449
Scotland	332,088
France	833,973
China	86,294
Other places	63,160
Total	$2,246,351

—*See* CASHMERE, COTTON MANUFACTURES, WOOL.

Sheathing. The covering laid on the ship's bottom to defend it from the worms. Sheets of thin copper nailed on with copper nails constitutes, at present, the sheathing of all the better kinds of vessels. Lead has been used; and large-headed iron nails, called scupper nails, are used still for the same purpose on the bottoms of old hulks, piles, etc. Zinc and different

compositions have been proposed as substitutes for copper; and Sir H. Davy ingeniously suggested the application of pieces of zinc or iron upon different parts of the copper surface, which by the action of the sea-water render the latter metal electro-negative, and capable, therefore, of resisting the oxidizing and corrosive agencies of the substances held in solution. The pieces of iron or of zinc so applied have been properly called *protectors;* but by occasioning the precipitation of earthy matters upon the copper, while they effectually *protect it*, they render its surface favorable to the adhesion of weeds, barnacles, etc., and sometimes to such an extent as to interfere with the passage of the ship through the water: upon such grounds, Sir Humphrey's valuable suggestion has been neglected. When vessels are laid up in dock the protectors are in successful use. Sheathing formerly was composed of thin fir boards. By a recent application of electrotyping, plates of sheet-iron are covered with a surface of copper which effectually protects the iron from oxidation. Iron bolts are also similarly electrotyped.

Sheep (Ger. *Schafe;* Fr. *Brebis, Bêtes à laine, Moutons;* It. *Pecore;* Sp. *Pecora, Ovejas;* Russ. *Owzà;* Lat. *Oves*). Of the domestic animals belonging to Great Britain, sheep, with the exception of horses, and perhaps cattle, are by far the most important. They can be reared in situations and upon soils where other animals would not live. They afford a large supply of food, and one of the principal materials of clothing. Wool has long been a staple commodity of this country, and its manufacture employs an immense number of people. "The dressed skin," says Mr. Pennant, "forms different parts of our apparel, and is used for covers of books. The entrails, properly prepared and twisted, serve for strings for various musical instruments. The bones, calcined (like other bones, in general), form materials for tests for the refiner. The milk is thicker than that of cows, and consequently yields a greater quantity of butter and cheese; and in some places is so rich, that it will not produce the cheese without a mixture of water to make it part from the whey. The dung is a remarkably rich manure insomuch that the folding of sheep is become too useful a branch of husbandry for the farmer to neglect. To conclude; whether we consider the advantages that result from this animal to individuals in particular, or to these kingdoms in general, we may, with Columella, consider this, in one sense, as the first of the domestic quadrupeds."—Pennant's *British Zoology.*

There was between 1840 and 1850 an increase of 2,309,108 in the number of sheep in the United States. It will be useful to observe with some closeness the progress of sheep-breeding in different parts of the country. We perceive that in New England there has occurred a remarkable decrease in their number. There were in that division of the Union in 1840, 3,811,307; in 1850 the number had declined to 2,164,482; being a decrease of 1,646,855, or 45 per cent. In the five Atlantic Middle States, New York, New Jersey, Pennsylvania, Delaware, and Maryland, there was a decrease from 7,402,851 to 5,641,391, equal to 1,761,460, or about 22¼ per cent. In Pennsylvania there was a gain, however, during this period, of 155,000 sheep. We see that while there has been a positive diminution of 3,408,000 in the States above named, there has been an augmentation of 5,717,608 in those south of Maryland and west of New York. Ohio has gained most largely, having been returned as pasturing in 1840, 2,028,401; and in 1850, 3,942,929; an increase of 1,914,528, or nearly 100 per cent. In each of the States south and west of the lines above indicated, there has been a very large proportional increase in this kind of stock, and there is reasonable ground for the opinion that the hilly lands of Virginia, North and South Carolina, Tennessee, and the prairies of Illinois, Iowa, and Texas, will prove highly favorable for the rearing of sheep for their wool and pelts.

New Mexico has the extraordinary number of 377,271 sheep—more than six to each inhabitant; proving the soil and climate of that territory to be well adapted to this description of stock, and giving promise of a large addition from that quarter to the supply of wool. The importance of fostering this great branch of national production is shown by the fact, as assumed by an intelligent writer on the subject, that our population annually consumes an amount of wool equal to seven pounds for each person. If this estimate be even an approximation to correctness, we are yet very far short of producing a quantity adequate to the wants of the country; and it is equally clear that we possess an amount of unemployed land adapted to grazing, sufficient to support flocks numerous enough to clothe the people of the world. The kinds of sheep most sought for are the pure-blooded Merinos, the Saxons, the Cotswolds, the Leicestershires, the Oxfordshires, and the South Downs. The *Merinos* (including the Rambouillets), the Cotswolds, the Leicestershires, the Oxfordshires, and the Saxons, are the most highly prized for their wool. The South Downs are particularly esteemed for the excellence of their flesh, and their wool is valuable for many purposes on account of the facility with which it can be wrought.—*U. S. Patent Office Report.* *See* Shawls and Wool.

Sheer. The curve which the line of ports or of the deck presents to the eye when viewing the side of the ship. When these lines are straight, or the extremities do not rise, as is most usual, the ship is said to have a straight *sheer.*

Sheer Hulk.—A hulk permanently fitted with sheers for masting and dismasting ships.

Sheers.—Two masts or spars lashed together at or near the head, and raised to a vertical position, for the purpose of lifting the masts into or out of vessels.

Sheet. The rope attached to the aftermost or leewardmost clew or corner of a sail, to extend it to the wind. In the square sails above the courses, the ropes attached to both clews are called *sheets:* in all other cases the weathermost one is called *a tack.*

Sheet Anchor. The third of the four large anchors generally carried by a ship.

Sherry. A Spanish wine made from the grapes of Xeres, in Andalusia. Genuine sherry is a rich, dry wine, containing from 20 to 23 per cent. of alcohol: there are many varieties, and it is extensively imitated and adulterated.—*See* Wine.

Shilling. An English silver coin, equal to twelvepence, or the twentieth part of a pound. Frecherus derives the Saxon *scilling*, whence our shilling, from a corruption of *siliqua;* proving the derivation by several texts of law, and, among others, by the twenty-sixth law, *De annuis legatis.* Skinner deduces it from the Saxon *scild*, "shield," by reason of the escutcheon of arms which it has upon it. Bishop Hooper derives it from the Arabic *scheele*, signifying *a weight;* but others, with greater probability, deduce it from the Latin *silicus*, which signified in that language a quarter of an ounce, or the forty-eighth part of a Roman pound. In confirmation of this etymology, it is alleged that the shilling kept its original signification, and bore the same proportion to the Saxon pound as sicilicus did to the Roman and the Greek, being exactly the forty-eighth part of a Saxon pound.

However, the Saxon law reckons the pound in the round number at fifty shillings, but they really coined out of it only forty-eight. The value of the shilling was five-pence, but it was reduced to four-pence above a century before the Conquest; for several of the Saxon laws, made in Athelstan's reign, oblige us to take this estimate. Thus it continued to the Norman times, as one of the Conqueror's laws sufficiently ascertains; and it seems to have been the common coin by which the English payments were adjusted. After the Conquest, the French *solidus* of twelve-pence, which was in use among the Normans, was called by the English

name of shilling; and the Saxon shilling of four-pence took a Norman name, and was called the *groat*, or great coin, because it was the largest English coin then known in England. It was the opinion of bishops Fleetwood and Gibson, and of the antiquaries in general, that, though the method of reckoning by pounds, marks, and shillings, as well as by pence and farthings, had been in constant use even from the Saxon times, long before the Norman Conquest, there was never such a coin in England as either a pound or a mark, nor any shilling, till the year 1504 or 1505, when a few silver shillings or twelve-pences were coined, which have long since been solely confined to the cabinets of collectors. Mr. Clarke combats this opinion, alleging that some coins mentioned by Mr. Folkes, under Edward the First, were probably Saxon shillings new minted, and that Archbishop Ælfric expressly says that the Saxons had three names for their money—mancuses, shillings, and pennies. He also urges the different value of the Saxon shilling at different times, and its uniform proportion to the pound, as an argument that their shilling was a coin; and the testimony of the Saxon Gospels, in which the word we have translated *pieces of silver* is rendered *shillings*, which, he says, they would hardly have done if there had been no such coin as a shilling then in use. Accordingly, the Saxons expressed their shilling in Latin by *siclus* and *argenteus*. He further adds, that the Saxon shilling was never expressed by *solidus* till after the Norman settlements in England; and howsoever it altered during the long period that elapsed from the Conquest to the time of Henry the Seventh, it was the most constant denomination of money in all payments, though it was then only a species of account, or the twentieth part of the pound sterling; and when it was again revived as a coin, it lessened gradually as the pound sterling lessened, from the 28th of Edward the Third to the 43d of Elizabeth.

In the year 1560 there was a peculiar sort of shilling struck in Ireland, of the value of nine-pence English, which passed in Ireland for twelve-pence. The motto on the reverse was, *Posui Deum adjutorem meum*. Eighty-two of these shillings, according to Malynes, went to the pound. They weighed, therefore, twenty grains one fourth each, which is somewhat heavier in proportion than the English shilling of that time, sixty-two of which went to the pound, each weighing ninety-two grains seven-eighths; and the Irish shilling being valued at the Tower at nine-pence English, that is, one fourth part less than the English shilling, it should therefore proportionally weigh one fourth part less, and its full weight be somewhat more than sixty-two grains. But some of them found at this time, though much worn, weighed sixty-nine grains. In 1598 five different pieces of money of this kind were struck in England for the service of the kingdom of Ireland. These were shillings to be current in Ireland at twelve-pence each, half-shillings to be current at six-pence, and quarter-shillings at three-pence. Pennies and half-pennies were also struck of the same kind, and sent over for the payment of the army in Ireland. The money thus coined was of a very base mixture of copper and silver; and two years after there were more pieces of the same kinds struck for the same service, which were still worse; the former being three ounces of silver to nine ounces of copper, and the latter only two ounces eighteen pennyweights to nine ounces two pennyweights of the alloy.

The Dutch, Flemish, and Germans have likewise their shilling, called *schelin*, *schilling*, and *scalin*; but these, not being of the same weight or fineness with the English shilling, are not current at the same value. The English shilling is worth about twenty-three French sols; those of Holland and Germany about eleven sols and a half; those of Flanders about nine. The Dutch shillings are also called *sols de gros*, because equal to twelve gros. The Danes have copper shillings worth about one fourth of a farthing sterling.—E. B. *See* Coins.

Ship-money was first levied A.D. 1007, and caused great commotions. This impost being illegally levied by Charles the First in 1634, led to the Revolution. He assessed London in seven ships, of 4000 tons and 1560 men; Yorkshire in two ships of 600 tons, or £12,000; Bristol in one ship of 100 tons; Lancashire in one ship of 400 tons. The trial of the patriot Hampden for refusing to pay the tax, which he at first solely opposed, took place in 1638. Ship-money was included in a redress of grievances, in 1641. Hampden received a wound in a skirmish with Prince Rupert, and died June 24, 1643.

Ships. Nautical men apply the term ship to distinguish a vessel having three masts, each consisting of a lower mast, a topmast, and top-gallant mast, with their appropriate rigging. In familiar language, it is usually employed to distinguish any large vessel, however rigged; but it is also frequently used as a general designation for all vessels navigated with sails; and it is in this sense that we now employ it.

Merchant Ships.—It is hardly possible to divide merchant ships into classes, at least with any degree of precision. Their size, shape, the mode of their rigging, etc., depend not merely on the particular trade for which they are destined, but on the varying tastes and fancies of their owners. In the *articles* Charter-party, Freight, Master, Owners, Seamen, Seaworthy, etc., the law with respect to ships and shipowners, in their capacity of carriers or public servants, and the reciprocal duties and obligations of the masters and crews, is pretty fully expounded.

Ship-building.—The art is attributed to the Egyptians, as the first inventors, the first ship (probably a galley) being brought from Egypt to Greece, by Danaus, 1485 B.C.—Blain. The first double-decked ship was built by the Tyrians, 786 B.C.—Lenglet. The first double-deck vessel built in England was of 1000 tons burden, by order of Henry VII., 1509; it was called the *Great Harry*, and cost £14,000.—Stow. Before this time, 24-gun ships were the largest in the British navy, and these had no port-holes, the guns being on the upper decks only. Port-holes and other improvements were invented by Descharges, a French builder at Brest, in the reign of Louis XII., about 1500. Ship-building was first treated as a science by Hoste, 1696. A 74-gun ship was put upon the stocks at Van Diemen's Land, to be sheathed with India-rubber, 1829. —Haydn. For articles on ship-building, see *Quarterly Review*, vol. iii. 28, xl. 227, xii. 444; *Anal. Mag.*, i. 203, vi. 450; Hunt's *Merchants' Mag.*, xi. 11, xviii. 172.

State of Shipping Interest.—The complaints which were so frequent some years since in regard to the shipping interest have now wholly ceased. Most probably they never had any very good foundation; but whether that were so or not, this interest has been for some time past in a peculiarly prosperous condition. This has been occasioned partly and principally by the gold discoveries in California and Australia, or rather by the unprecedented stimulus which they have given to emigration and commerce. It is not, therefore, to be supposed that the existing state of things, as respects the shipping interest, can be permanent; for while, on the one hand, the advantages resulting from emigration will gradually diminish, on the other the supply of ships will be augmented in proportion to the greater demand for their services. However, it is all but certain that the commerce of the world is destined to increase for a long time to come; and our mercantile navy will, no doubt, continue to realize a full and fair share of the advantages resulting from this extension of trade.

Some very important changes have been made of late years, and are yet in progress, in the construction of ships. They are now built of a much larger size than formerly, of finer models, and with a power of

sailing of which no just idea could previously have been formed. Ships of 2000 tons burden are now reckoned only of little more than a medium size; and those of 2300 and 2500 tons and upward are every day becoming more and more common. It is probable, indeed, that in this, as in most other things, we shall run from one extreme into another; and that from being too small, our ships for distant voyages will become too large and unwieldy. This, however, is a point which experience only can settle, and to that it may safely be left. Iron ships are also, as previously stated, beginning to be extensively constructed; and ships are now frequently fitted out with screws and steam-engines, to be used only as a subsidiary power in calms, and against contrary winds.

Most sorts of short passage traffic are now carried on by steamers; and it is probable that in the end they will engross the greater part of the coasting trade of most countries, and of the trade between foreign countries adjacent to each other. But the improved class of sailing ships have little to fear from the competition of steamers in all the more distant branches of trade.—For general statistics in regard to the number of ships and amount of tonnage, *see articles* STEAM NAVIGATION and TONNAGE

Shipping, Laws of.—Under the general heads of AFFREIGHTMENT, CHARTER-PARTY, BILLS OF LADING, CARRIERS, COLLISION, COMMERCE, MASTERS, MARITIME LAWS, REGISTRY, SEAMEN, etc. (*see* INDEX), particular information has been given concerning the laws of shipping. We will, therefore, in this article only give a synopsis of the general laws regulating ships and shipping.

Title to Vessels.—The title of a ship, unless acquired by capture, passes by writing. A bill of sale is the proper record of title to a ship, and one which the maritime courts of all nations will look for and, in their ordinary practice, require. In Scotland, a written conveyance of property in ships has, by custom, become necessary; and in England a statute requires it with regard to British subjects. In this country, possession of a ship and acts of ownership are presumptive evidence without the aid of documentary proof, and will hold good until destroyed by contrary proof, and a sale with delivery of a ship, without a bill of sale or written instrument of any kind, will be good at law. But the presumptive title from possession can easily be destroyed; and the general rule is that no person can convey who has no title, and the fact of possession does not give title. The master of a ship has no authority to sell, unless in a case of necessity. It is generally, though not universally, considered that a sale by order of an admiralty court in a foreign port, by a petition of the master on the ground of unseaworthiness, is valid. The capture by a public enemy divests the title from the original owner after a regular condemnation by a prize court. Upon the sale of a ship in port, delivery of possession is requisite to perfect the title. If the vessel is at sea at the time of sale, possession must take place upon arrival at port.

Liability of Owner.—The owner is personally liable as owner for necessaries furnished and repairs made to a ship by order of the master. It has been a disputed question whether the mortgagee of a ship is liable before taking possession. The weight of the American decisions decides that he is not liable for repairs procured on the order of the master, if not upon the credit of the mortgagee, and if the same was not in receipt of the freight. When the vessel is at sea, the liability of the mortgagee for wages, etc., resolves itself into the question of his possession. The liability of the charterer or freighter under similar circumstances also depends upon the question of temporary ownership by their use of the vessel.

Custom-house Documents.—The United States have followed the policy of other commercial nations in giving peculiar privileges upon American-built vessels owned by our own citizens. This is obtained by a registry of vessels (*see article* REGISTRY), and which provision is intended to encourage our own trade, navigation, and ship-building. The registry of all vessels at the custom-house, and the records of the transfers also, add great security to the titles. No vessel is to be deemed as belonging to the United States, and entitled to the privileges of one, unless registered and wholly owned and commanded by a citizen of the United States.

Part Owners.—The several part owners of a ship are tenants in common, and not partners. Each has his undivided interest, and when one is appointed to manage the concerns of the ship he is called the ship's husband. If there be no definite agreement among the owners as to the employment of the ship, the majority in value may employ the ship, while the admiralty court secures the interests of the minority from injury. This practice is dictated by the commonsense view that "ships were made to plow the ocean, and not to rot by the wall." The court takes a security from the majority to a sum equal to the shares of the minority, either to bring back the ship or pay the minority the value of their shares, and in this case the ship sails wholly at the profit or risk of the majority. The distinction between part owners and partners may be stated thus: Part ownership is but a tenancy in common, and as such a part owner can only sell his undivided right, and can give title only to such; but a partner has implied authority over the joint property. A vessel may be held in partnership, but is not unless by agreement.—*See* KENT'S *Comm.*, vol. iii.

Carriage of Goods.—When the ship is hired and the cargo laden on board, the duties of the owner, and of his agent, the master, arise in respect to the commencement, progress, and termination of the voyage. When the voyage is ready, the master is bound to sail as soon as the wind and the tide permit, but he ought not to set out in very tempestuous weather. If, by the charter-party, the vessel is to sail by a given day, the master must do it, unless prevented by necessity; and if there be an understanding to sail with convoy, he is bound to go to the place of rendezvous, and place himself under the protection and control of the convoy, and continue, as far as possible, under that protection during his course. He is bound, likewise, to obtain the necessary sailing instructions for the convoy; but these covenants to sail with the first fair wind and with convoy, are not conditions precedent to the recovery of freight, and a breach of them only goes to the question of damages. The master is bound, likewise, to proceed to the port of delivery without delay, and without any unnecessary deviation from the direct and usual course. If he covenants to go to a loading port by a given time, he must do it or abide the forfeiture; and if he be forced by perils out of his regular course, he must regain it with as little delay as possible. Nothing but some just and necessary cause, as to avoid a storm, or pirates, or enemies, or to procure requisite supplies or repairs, or to relieve a ship in distress, will justify a deviation from the regular course of the voyage. If he deviates unnecessarily from the usual course, and the cargo be injured by tempests during the deviation, it is a sufficient proximate cause of the loss to entitle the freighter to recover; though if it could be shown that the same loss not only might but must have happened if there had not been any deviation, the conclusion might be otherwise. Nor has the captain any authority to substitute another voyage in the place of the one agreed between the owner and freighter of the ship. Such a power is altogether beyond the scope of his authority as master. In case of necessity, as where the ship is wrecked, or otherwise disabled in the course of the voyage, and can not be repaired, under the circumstances, without too great delay and expense, the master may procure another competent vessel to carry on the cargo and save his freight. If other means

to forward the cargo can be procured, the master must procure them or lose his freight; and if he offers to do it, and the freighter will not consent, he will then be entitled to his full freight. The master must act in port of necessity for the best interest of all concerned, and he has the power and discretion adequate to the trust, and requisite for the safe delivery of the cargo at the port of destination. If there be another vessel in the same or in a contiguous port which can be had, the duty is clear and imperative upon the master to hire it; but still the master is to exercise a sound discretion adapted to the case. He may transmit the cargo, if he has the means, or let it remain. He may bind it for repairs to the ship. He may sell part, or hypothecate the whole. If he hires another vessel for the completion of the voyage, he may charge the cargo with the increased freight arising from the hire of the new ship. The master may refuse to hire another vessel, and insist on repairing his own; and whether the freighter be bound to wait for the time to repair, or becomes entitled to her goods without any charge of freight, will depend upon circumstances. What may be a reasonable time for the merchant to wait for the repairs can not be defined, and must be governed by the facts applicable to the place and the time, and to the nature and condition of the cargo. A cargo of a perishable nature may be so deteriorated as not to endure the delay for repairs, or to be too unfit and worthless to be carried on. The captain is not bound to go to a distance to procure another vessel, and encounter serious impediments in the way of putting the cargo on board another vessel. His duty is only imperative when another vessel can be had in the same or a contiguous port, or at one within a reasonable distance, and there be no great difficulties in the way of a safe reshipment of the cargo. In the course of the voyage, the master is bound to take all possible care over the cargo; and he is responsible for every injury which might have been prevented by human foresight and prudence, and competent naval skill. He is chargeable with the most exact diligence. If the ship be captured during the voyage, the master is bound to render his exertions to rescue the property from condemnation, by interposing his neutral claims, and exhibiting all the documents in his power for the protection of the cargo.

Of the Delivery of the Goods at the Port of Destination.—On the arrival of the ship at the place of destination, the cargo is to be delivered to the consignee, or to the order of the shipper, on the production of the bill of lading and payment of the freight. The cargo is bound to the ship as well as the ship to the cargo; but the master can not detain the goods on board the ship until the freight be paid, for the merchant ought to have an opportunity to examine the condition of them previous to payment. Delivery at the wharf (where there are no special directions to the contrary) discharges the master. But there must be a delivery at the wharf to some person authorized to receive the goods, or due previous notice must have been given to the consignee of the time and place of delivery; and the master can not discharge himself by leaving them naked and exposed at the wharf. His responsibility will continue until there is actual delivery, or some act which is equivalent, or a substitute for it, unless the owner of the goods or his agent had previously assumed the charge of the goods; or at least until the consignee has had notice of the place and time of delivery, and the goods have been duly separated and designed for his use. When there are conflicting claims between consigner and consignee, or consigner and the assignee of the consignee, if the consignee has failed, he ought to deliver to the claimant on behalf of the consignee; and if the consignee has assigned the bill of lading, and the rights of the consignee be still interposed and contested, it is safest for the master to deposit the goods with some bailee, until the rights of the claimants are settled, as they can always be upon a bill of interpleader in chancery to be filed by the master. Having made a consignment, the consignee or seller has not an unlimited power to vary it at pleasure. He may do it only for the purpose of protecting himself against the insolvency of the buyer or consignee.

Responsibility of the Ship-owner.—The cases that will excuse the owners and masters for the non-delivery of the cargo must be events falling within the meaning of one of the expressions, act of God and public enemies; or they must arise from some event expressly provided for in the charter-party. Water-carriers are liable as common carriers in all the strictness and extent of the common-law rule, unless the loss happens by means of one of the excepted perils. A loss by lightning is within the exception of the act of God; but a loss by fire proceeding from any other cause is chargeable upon the ship-owner. The moment the goods are transferred from the ship or lighter to the warehouse, this extraordinary responsibility ends.

If a rock or a sand-bar be generally known, and the ship be not forced upon it by adverse winds or tempests, the loss is to be imputed to the fault of the master. But if the ship be forced upon such shallow by winds or tempests, or if the bar was occasioned by a recent and sudden collection of sand in a place where ships could before sail with safety, the loss is to be attributed to a peril of the sea. A statute in Massachusetts, passed in 1818, and re-enacted in 1835, limits the responsibility of owners for the acts of the master and mariners to the value of the ship and freight, but otherwise the owner is bound for the whole amount of the injury done by the master or crew.

Duties of the Shippers.—The duties of the charterer are to use the ship in a lawful manner, and for the purpose for which it was let. If the freighter puts on board prohibited or contraband goods, by means whereof the ship is subjected to detention and forfeiture, he must answer to the ship-owner for the consequences of the act. And if the merchant declines to lade the ship according to contract, or to furnish a return cargo, as he had engaged to do, he must render in damages due compensation for the loss.

Payment of Freight.—Freight, in its original and more common acceptation, means the hire which is earned for the transportation of goods, but in its more extensive sense it is applied to all rewards for compensation paid for the use of ships. If the hiring be of the whole ship, or for an entire part of her for the voyage, the merchant must pay the freight though he does not fully lade the ship. But if he agrees to pay in proportion to the amount of the goods put on board, and does not agree to provide a whole cargo, the owner can demand payment for the cargo actually shipped. If the merchant agrees to furnish a return cargo, and he furnishes none, and lets the ship return in ballast, he must make compensation to the amount of the freight.—Leone Levi's *Com. Law of the World.*

Analysis of the General Law of Shipping.—The sale of ships in Great Britain must be made by a bill of sale containing a recital of the certificate of registry. In France, Spain, and Sardinia, it must be made by public deed. In Holland the deed is transferred into a public register. All British subjects are authorized to possess shares in ships in Great Britain. In Spain foreigners not naturalized can not acquire the ownership of ships. In Russia this right is limited to merchants of the first and second guild. Part owners are tenants in common with each other of their respective shares in Great Britain. Each ship's husband may sell his share, but he should give preference to his part owners at equal price, provided they pay the price within three days: Spain, Prussia, Russia, Denmark, and Sweden. The responsibility of ship-owners for the acts of the captain is unlimited in Prussia and Spain, provided it be proved that such expenses turned to the advantage of the vessels. In Great Britain the own-

ere are responsible where the expenditure is for necessaries. In Portugal obligations are not binding beyond the value of the ship and freight. In France owners may relieve themselves from such obligations by the abandonment of ship and freight. In Russia the ship's husband is responsible only to the value of the ship. In the Two Sicilies, Sardinia, Holland, Greece, and Hayti, the same restriction is admitted. In the United States the seamen are not paid if the ship and freight have been lost; but their wages are preferred to bottomry bond on the ship and freight preserved.—*See* OWNERS OF SHIPS. In France the same law prevails.

Ships' Papers, the papers or documents required for the manifestation of the property of the ship and cargo, etc. They are of two sorts; viz., 1st, those required by the law of a particular country—as the certificate of registry, license, charter-party, bills of lading, bill of health, etc. (see these titles), required by the law of England to be on board British ships; and, 2d, those required by the law of nations to be on board neutral ships, to vindicate their title to that character. Mr. Sergeant Marshall, following Hubner (*De la Saisie des Bâtimens Neutres*, i. 241–252), has given the following description of the latter class of documents:

1. *The Passport, Sea Brief, or Sea Letter.*—This is a permission from the neutral state to the captain or master of the ship to proceed on the voyage proposed, and usually contains his name and residence; the name, property, description, tonnage, and destination of the ship; the nature and quantity of the cargo, the place whence it comes, and its destination; with such other matters as the practice of the place requires. This document is indispensably necessary for the safety of every neutral ship. Hubner says that it is the only paper rigorously insisted on by the Barbary corsairs; by the production of which alone their friends are protected from insult.

2. *The Proofs of Property.*—These ought to show that the ship really belongs to the subjects of a neutral state. If she appear to either belligerent to have been built in the enemy's country, proof is generally required that she was purchased by the neutral before, or captured and legally condemned and sold to the neutral after, the declaration of war; and in the latter case the *bill of sale*, properly authenticated, ought to be produced. Hubner admits that these proofs are so essential to every neutral vessel, for the prevention of frauds, that such as sail without them have no reason to complain if they be interrupted in their voyages, and their neutrality disputed.

3. *The Muster-roll.*—This, which the French call *rôle d'équipage*, contains the names, ages, quality, place of residence, and, above all, *the place of birth*, of every person of the ship's company. This document is of great use in ascertaining a ship's neutrality. It must naturally excite a strong suspicion, if the majority of the crew be found to consist of foreigners; still more, if they be natives of the enemy's country.—*See* SEAMEN.

4. *The Charter-party.*—Where the ship is chartered, this instrument serves to authenticate many of the facts on which the truth of her neutrality must rest, and should therefore be always found on board chartered ships.—*See* AFFREIGHTMENT and CHARTER-PARTY.

5. *The Bills of Lading.*—By these the captain acknowledges the receipt of the goods specified therein, and promises to deliver them to the consignee or his order. Of these there are usually several duplicates; one of which is kept by the captain, one by the shipper of the goods, and one transmitted to the consignee. This instrument, being only the evidence of a private transaction between the owner of the goods and the captain, does not carry with it the same degree of authenticity as the charter-party.—*See* BILLS OF LADING.

6. *The Invoices.*—These contain the particulars and prices of each parcel of goods, with the amount of the freight, duties, and other charges thereon, which are usually transmitted from the shippers to their factors or consignees. These invoices prove by whom the goods were shipped, and to whom consigned. They carry with them, however, but little authenticity, being easily fabricated where fraud is intended.

7. *The Log-book, or Ship's Journal.*—This contains a minute account of the ship's course, with a short history of every occurrence during the voyage. If this be faithfully kept, it will throw great light on the question of neutrality; if it be in any respect fabricated, the fraud may in general be easily detected.

8. *The Bill of Health.*—This is a certificate, properly authenticated, that the ship comes from a place where no contagious distemper prevails; and that none of the crew, at the time of her departure, were infected with any such disorder. It is generally found on board ships coming from the Levant, or from the coast of Barbary, where the plague so frequently prevails.

A ship using false or simulated papers is liable to confiscation.—MARSHALL *on Insurance.*

The reciprocal Duties of Consular Officers and Masters of American Vessels.—By an act of the Congress of the United States, approved February 28, 1803, it is in substance directed that every master of an American vessel shall, on his arrival at a foreign port, deposit his register, sea-letter, and Mediterranean passport, with the consular officer of the United States, if there be one at the port, under a penalty of $500, which the consular officer may recover in his own name for the use of the United States. Whenever a clearance from the proper officer of the port shall be produced to the consular officer, he shall deliver up all the ship's papers, provided the master shall have complied with the provisions of the above-mentioned act, and those of the 28th section of the act of August 18, 1856. Where vessels merely touch at a foreign port to try the market, or are accidentally driven into such port, and make no formal entry, it does not constitute an "*arrival*" within the meaning of the act, and the ship's papers can not be required by the consul.

As some doubt has arisen in regard to what constitutes an "arrival," attention is particularly called to the following extract from an opinion of the Supreme Court of the United States: "Our view, then, is, that the term *arrival*, as used in this act, must be construed according to the subject-matter, the object of the provision, and the expressions in other sections of this act, and in other like acts; and that according to all these, a vessel putting into a foreign port to get information, and getting it without going at all to the upper harbor or wharves, and not entering, or repairing, or breaking bulk, or discharging seamen, or being bound homeward, so as to take seamen, or needing the aid of the consul in any respect, but leaving the port in a few hours; not doing any of these, nor being required to, and duly entering and delivering her cargo at a neighboring port, where it had been sold, and there depositing her papers with the vice-consul, can not be said to have arrived at the first port, so as to come within the spirit of the penal provision as to depositing her papers with the consul. So far as regards precedents on this matter, the actual decision of one court and the opinions of two Attorneys General are in favor of our conclusion."

Vessels accidentally driven into a port are not required to deposit their papers with the consular officer, unless formal entry be afterward made, or consular services required. It is stated in the opinion of the Attorney-general of October 17, 1853, that the body of the second section of the act of 1803 contemplates an arrival at a foreign port, with a clearance from the proper officer of the port. It is the production of the clearance to the consular officer which gives to the master the right to demand a return of the ship's papers, and imposes on the consul the duty of returning them. The proviso to the section allows the consular officer, notwithstanding the clearance from the proper

officer of the port, to detain the ship's papers until certain requirements of law shall have been complied with: which are the payment of the fees due the consular officer for his services; the payment to him of three months' pay, additional to wages due, for every discharged seaman who is designated on the certified list of the ship's company as a citizen of the United States; and the taking on board, at the request of the consular officer, of destitute mariners for transportation to the United States.

This right of the consular officer attaches to the register and other papers when they shall have been lawfully deposited with him; but the statute does not compel the deposit for the purpose of giving the right of detention. Neither the section of the act which regards discharged seamen, nor that which provides for distressed seamen, nor the regulation as to consular fees, requires a deposit of the register and other papers, although the former makes it the duty of the master to exhibit to the consul a certified list of the ship's company. And the proviso above cited does not enlarge the scope of the other provisions of law as to the deposit of the papers; it only releases the consul from the duty, which would otherwise be imperative upon him, of returning the papers upon the exhibition of the clearance alone.

By the first section of the act of 1803, it is made the duty of the consular officer, immediately on the arrival of an American vessel, should the master neglect to deliver his ship's papers, as he is directed by law, to inform him of the necessity of so doing, by showing him the law that requires it, and apprising him of the penalty he will incur by refusal or neglect. If he fail to comply, a certificate of the fact, under the consular seal, must be immediately sent to the Department of State, giving a description of the vessel, the port to which she belongs, where bound, and the usual residence of the master. In such a case, it is desirable that the consul should send some other evidence of the arrival and departure of the delinquent master with his vessel besides that of his own certificate, as it has been held that such evidence of any fact is not sufficient, unless expressly or impliedly made so by statute.

Whenever the master shall produce the clearance of his vessel, and shall have complied with the directions of the acts above mentioned, having fulfilled every lawful requisition of the consul and of the local authorities, the consul shall, without delay, deliver up the papers, with a consular certificate, under seal, of the time of such delivery, and make an entry of the like period in his consular record.

Before a clearance is granted to any American vessel bound on a foreign voyage, the master thereof is required to deliver to the collector of the customs a list, containing the names, places of birth and residence, and a description of the persons who compose his ship's company, to which list the oath or affirmation of the captain is to be annexed, that it contains the names of his crew, together with the places of their birth and residence, as far as he can ascertain them; a certified copy, written in a uniform hand, without erasures or interlineations, must be delivered to the master by the collector, for which he is entitled to receive from the master the sum of twenty-five cents. The said master must then enter into bond, with sufficient security, in the sum of $400 dollars, to exhibit the aforesaid certified copy of the list to the first boarding-officer at the first port in the United States at which he shall arrive on his return thereto, and then and there also to produce the persons named therein to the said boarding-officer, whose duty it is to examine the men with such list, and to report the same to the collector.

By the act of Congress, August 18, 1856, it is made the duty of every master and commander of a ship or vessel of the United States, whenever he shall have occasion for any consular or other official service which any consular officer of the United States shall be authorized by law or usage officially to perform, and for which any fees shall be allowed by the said rates or tariffs of fees as aforesaid, to apply to such one of the said officers to perform the service as may then be officially in charge of the consulate or commercial agen-

SHIP'S DAILY JOURNAL.

In which, on the deposit of the ship's register and papers, shall be recorded, for example, as follows:

SHIP ——, OF ——, —— TONS, —— —— MASTER.

Date of entry and of service rendered.					
18 6.					
Jan.	2	Arrived —— day of ——, 18—.			
		From ——.			
		When built, ——, 18—.			
		Where built, ——.			
		Owners, —— —— and others.			
		Cargo, inward [here insert where produced or manufact'd], value	$..	...	..
		Cargo, outward [here insert where produced or manufact'd], value	...	...	..
		A B, master.			
		C D, mate.			
		E F, 2d mate.			
"	3	G H, boatswain, alias I J, sent to hospital.			
		K L, carpenter, discharged; wages paid, $50; 3 months' extra wages, at $20, $60	...	$110	00
"	2	M N, steward, reported to have been lost overboard at sea (or to have died at sea), Dec. 21, 1856, wages paid	...	10	00
"	3	O P, cook, reported to have deserted; amount of wages forfeited to the United States	...	50	00
		Q R, seaman.			
		Etc., etc.			
"	20	Shipped for voyage to ——.			
		—— ——, boatswain.			
		—— ——, carpenter.			
		—— ——, steward.			
		—— ——, cook.			
"	21	Register and papers delivered to master, bound to ——.			

NOTE.—Should any of the seamen or mariners have died at sea, or have been lost overboard, on the passage, the fact will be reported at once by the master, and a note thereof made opposite to the name of such person so deceased or lost; as, for example, see Steward. Should any seaman or mariner be discharged, or desert, a similar note of the fact must be made opposite to such deserter's or discharged seaman's name; as, for example, see Carpenter and Cook. In case any seaman or mariner has taken the name of any other seamen or mariner, who may have deserted or otherwise absented himself, after the clearing of the vessel, in the United States or elsewhere, such seaman or mariner's correct and proper name must be entered opposite the name of the seaman or mariner so deserting or absenting himself; as, for example, see Boatswain. And in the event of the seaman or mariner's taking the name of another seaman or mariner as aforesaid, entering the hospital, being discharged, or deserting, the order to the hospital, certificate of discharge or desertion, and consular returns must contain the name of said seaman or mariner so taking the place of the absconding seaman; as, for example, see Boatswain.

MARINE NOTE OF PROTEST.

Consulate of the United States of America,
Port of ——.

——, ——.

On this —— day of ——, in the year of our Lord eighteen hundred and ——, before me, —— ——, consul of the United States of America for —— and the dependencies thereof, personally appeared —— ——, master of the ship or vessel called the ——, of ——, of the burden of —— tons or thereabout, and declared that on the —— day of —— last past, he sailed in and with the said ship from the port of ——, laden with ——, and arrived in the said ship at ——, on [here insert the day and hour]; and having experienced boisterous and tempestuous weather on the voyage ——

hereby enters this Note of Protest accordingly, to serve and avail him hereafter if found necessary.

——, ——.

Attested: *Master.*

A B, *Consul.*

SHIP ——,
MARINE EXTENDED PROTEST OF —— ——, MASTER,
——, 18—.

Consulate of the United States of America,
Port of ——.

By this public instrument of declaration and protest, be it known and made manifest unto all to whom these presents shall come or may concern, that on the —— day of ——, one thousand eight hundred and ——, before me, —— ——, consul of the United States of America for ——, and the dependencies thereof, personally came and appeared —— ——, master of the ship or vessel called the ——, of ——, of the burden of —— tons, or thereabout, then lying in this port of ——, laden with —— cargo, who duly noted and entered with me the said consul his protest, for the uses and purposes hereafter mentioned; and now, on this day, to wit, the day of the date hereof, before me, the said consul, again comes the said —— ——, and requires me to extend this protest; and together with the said —— —— also come A B, mate, G H, carpenter, K L and M O, seamen, of and belonging to the said ship, all of whom being by me duly sworn on the Holy Evangelists of Almighty God, did severally voluntarily, freely, and solemnly declare, depose, and state as follows, that is to say: That these appearers, on the —— day of ——, in their capacities aforesaid, sailed in and with the said —— from the port of ——, laden with ——, and bound to the port of ——; that the said ship was then tight, staunch, and strong; had her cargo well and sufficiently stowed and secured; had her hatches well caulked and secured; was well and sufficiently manned, victualed, and furnished with all things needful and necessary for a vessel in the merchant service, and particularly for the voyage she was about to undertake; that

[Here insert narrative of the facts of the voyage as they occurred, with full and minute particulars, with dates, latitude, longitude, etc.]

And these said appearers, upon their oaths aforesaid, do further declare and say: That during the said voyage they, together with the others of the said ship's company, used their utmost endeavors to preserve the said —— and cargo from all manner of loss, damage, or injury. Wherefore the said —— ——, master, hath protested, as by these presents I, the said consul, at his special instance and request, do publicly and solemnly protest, against all and every person and persons whom it doth or may concern, and against the winds, and waves, and billows of the seas, and against all and every accident, matter, and thing, had and met with as aforesaid, whereby, and by reason whereof, the said —— or cargo already has, or hereafter shall appear to have suffered or sustained damage or injury. And do declare that all losses, damages, costs, charges, and expenses that have happened to the said —— or cargo, or to either, are, and ought to be borne by those to whom the same by right may appertain by way of average or otherwise, the same having occurred as before mentioned, and not by or through the insufficiency of the said ——, her tackle or apparel, or default or neglect of this appearer, his officers, or any of his mariners.

Thus done and protested in the port of ——, this —— day of ——, in the year of our Lord one thousand eight hundred and ——.

In testimony whereof these appearers have hereunto subscribed their names, and I, the said consul, have granted to the said master this public instrument, under my hand and the seal of this consulate, to serve and avail him and all others whom it doth or may concern, as need and occasion may require.

{ SEAL OF THE CONSUL. }

Master.
A B, *Mate.*
G H, *Carpenter.*
K L, *Seaman.*
M O, do.

—— ——, *U. S. Consul.*

Shipwrecks. *See* WRECKS.

Shoal, in the *Sea language*, denotes a place where the water is shallow; and likewise a great quantity of fishes, such as a *shoal of herrings.*

Shoes (Du. *Schoenen;* Fr. *Souliers;* Ger. *Schuhe;* It. *Scarpe;* Russ. *Baschmaki;* Sp. *Zapatos*), articles of clothing that are universally worn, and require no description. The shoe manufacture is of great value and importance.

Boot and Shoe Trade.—The annual value of boots and shoes manufactured in Massachusetts is estimated at $37,000,000, exceeding any other branch of manufacture. The demand for boots and shoes for years past has been fully equal to the production, and the trade generally of Boston has been quite up to expectation. The high prices of leather and all kinds of stock have induced manufacturers to work very cautiously, and they have turned out no more goods than were actually wanted. The trade opened in January last with a good demand and a firm market, and the purchases generally were at an advance of about 5 per cent. Early in February the trade was materially checked by the ice embargo South and West, which completely closed river and harbor navigation, and prevented the forwarding of goods. The opening of navigation in March led to an active demand, and throughout March and April the business was quite active, buyers from the South and West completely clearing the market of all desirable goods, the Spring trade closing quite satisfactorily.

The high cost of stock the past year has also been quite a check on the production, keeping it within the limits of the demand; and the same policy is likely to control the operations of manufacturers the coming year. For some months past the quantity of goods turned out has been comparatively small, and the supply on the market for Spring sales will not be likely to exceed the actual wants of the trade. The quantity of boots and shoes cleared at the custom-house has been as follows:

Years.	Quantity.	Years.	Quantity.
1847	72,424	1852	195,729
1848	79,118	1853	220,138
1849	101,371	1854	196,411
1850	147,760	1855	204,601
1851	153,912	1856	224,329

A large portion of the supplies for the West are forwarded by railroad, and are of course not included in the above statement.

In one county alone of Massachusetts (Essex) the annual product of boots and shoes in 1855, according to the census, was over $12,000,000. As this is the leading trade of the State, we enumerate the product of each county:

Barnstable	$13,300
Berkshire	110,800
Bristol	498,000
Dukes	3,000
Essex	12,192,800
Franklin	62,300
Hampden	124,100
Middlesex	6,702,100
Nantucket	10,300
Norfolk	4,987,000
Hampshire	60,400
Plymouth	4,868,700
Suffolk	193,900
Worcester	7,857,300
Total value of boots and shoes	$37,4 0,000
Leather, tanned and curried	10,934,400
Patent enameled leather	1,271,900

In the immediate vicinity of Boston there are manufactures to the extent of at least $150,000,000 annually, and of this the value added to the raw material by labor can not be less than $75,000,000. In addition, the foreign dry goods, groceries, drugs, hardware, and a multiplicity of other articles sold there, swell the trade of Boston to nearly or quite a hundred millions more. Of manufactures, the first in importance are domestic cottons; and of about fifty millions manufactured annually, they send to foreign countries less than two millions, or 4 per cent. One half of these go to the west coast of South America, the east coast of South America, and the Central American States, while the West Indies receive less than $220,000 worth of cotton manufactures from Boston in a year. The trade of Boston with Cuba during the fiscal year ending June

30, 1856, stood as follows: Value of imports, $3,683,226; exports, $1,044,359.

EXPORTS OF DOMESTIC BOOTS AND SHOES FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Shola. There is a singular substance manufactured in India from the cellular, pith-like stems of the *hedysarum lagenarium*. It closely resembles in appearance the Chinese rice-paper, and is considered to be well adapted to various purposes in the arts. The shola is wrought in India into life-buoys, boxes, bottle-cases, hats, and numerous other articles. From its loosely-cellular structure, it is a very bad conductor of heat, and this, together with its lightness, admirably fits it for the manufacture of hats. It is also advantageously fitted for purposes of ornament, as it may readily be made to present all the appearance of ivory.

Shore, a place which is washed by the sea or by some large river. Count Marsigli divides the sea-shore into three portions: the first of which is that tract of land which the sea just reaches in storms and high tides, but which it never covers; the second part of the shore is that which is covered in high tides and storms, but is dry at other times; and the third is the descent from this, and is always covered with water. The first part is only a continuation of the continent, and suffers no alteration from the neighborhood of the sea, except that it is rendered fit for the growth of some plants, and wholly unfit for that of others, by the saline steams and impregnations; and it is scarcely to be conceived by any but those who have observed it how far on land the affects of the sea can reach, so as to make the earth proper for plants which will not grow without this influence; there being several plants frequently found upon high hills and dry places at three, four, and more miles from the sea, which yet would not grow unless in the neighborhood of it, nor will they ever be found elsewhere.

The second part or portion of the shore is much more affected by the sea than the former, being frequently washed and beaten by it. Its productions are rendered salt by the water, and it is covered with sand or with the fragments of shells in the form of sand, and in some places with a tartarous matter deposited from the water. The color of this whole extent of ground is usually dusky and dull, especially where there are rocks and stones covered with a slimy matter.

The third part of the shore is more affected by the sea than either of the others; and it is covered with a uniform crust of the true nature of the bottom of the sea, except that plants and animals have their residence in it, and the decayed parts of these alter it a little.—*See* GULF STREAM and OCEAN.

Shumac, or **Sumach** (Ger. *Schmack, Sumach;* Fr. *Sumac, Roure, Roux;* It. *Sommaco;* Sp. *Zumaque;* Russ. *Sumak*). Common shumac (*Rhus coriaria*) is a shrub that grows naturally in Syria, Palestine, Spain, and Portugal. That which is cultivated in Italy, and is improperly called *young fustic,* is the *Rhus cotinus.* It is cultivated with great care: its shoots are cut down every year quite to the root; and, after being dried, they are chipped or reduced to powder by a mill, and thus prepared for the purposes of dyeing and tanning. The shumac cultivated in the neighborhood of Montpellier is called *rédoul* or *roudo.* Shumac may be considered of good quality when its odor is strong, color of a lively green, is well ground, and free from stalks. Italian shumac is used in dyeing a full high yellow, approaching to the orange, upon wool or cloth; but the color is fugitive. Common shumac is useful for drab and dove colors in calico-printing, and is also capable of dyeing black.—BANCROFT *on Colors.*

Siam. This extensive kingdom, in the southeastern part of Asia, occupies the central part of Farther India, and has on its west the British Tessarin provinces and the Bay of Bengal; on the north and northwest, Burmah and the free Laos country; on the east, Anam; and on the south, a coast line of 1470 miles along the Gulf of Siam. Its area has been differently estimated: some authors extending it to 294,720 square miles, of which there are assigned to Siam proper 141,175 square miles; 20,420 to Cambodia; 108,645 to the tributary Laos; and 24,480 to the Malay provinces. Crawford, however, who seems to have enjoyed the most favorable opportunities of correctly estimating the extent of Siam, fixes its area at 190,000 square miles.

The same authority estimates the population at 2,790,500, in 1822; but the American commissioner, who negotiated the commercial treaty with Siam on the part of the United States in 1832, gives an estimate for that period as follows:

Siamese	1,600,000
Laos	1,200,000
Malays	320,000
Chinese	500,000
Total	3,620,000

All authors concur in representing Siam as one of the most fertile and delightful countries in the East, and capable, when its immense resources are more fully developed, of sustaining an extensive and valuable foreign trade. No other country eastward of the Cape of Good Hope abounds more plentifully in all the productions suited for foreign commerce; and it is found

to be no less distinguished for the great variety of its mineral than it is acknowledged to be for its vegetable productions. The largest-sized vessels are built annually in Siam. Some of the Chinese junks, the construction of which forms an important feature in the trade with China, measure 1000 tons burden. The timbers are of a hard wood, called by the natives *marbao*, and the plank are of the finest teak in the world.

Among the large rivers of Siam, through which the internal and foreign trade of the kingdom is conducted, the Menam is the most important, as pervading the greater part of the kingdom, and almost monopolizing its trade and navigation. On this river is situated Bangkok, which has long been the great centre of the commerce of the kingdom, inland, coastwise, and foreign. The principal articles brought down this river from the higher provinces are rice and paddy, cotton, teak-timber, sapan-wood, lac, benzoin, ivory, and beeswax; while the districts east and west of the Menam furnish gamboge, cardamoms, and sugar; and the Malay provinces contribute to the trade of Bangkok tin, zinc, cotton, etc. The foreign trade is conducted chiefly with the southern ports of Anam, Java, Singapore, Pulo-Penang, and occasionally with British India, the United States, and Great Britain. The most extensive foreign trade of Siam is with China; this trade employs from 200 to 300 junks annually, having an aggregate burden of about 25,000 tons, mostly built in Siam by the Chinese. These junks make one voyage annually, leaving the Menam in June, and returning in December. The exports to the United States and to Europe comprise sugar, pepper, lac, benzoin, gamboge, tin, cardamoms, ivory, horns, and hides, with other articles of minor importance. For these they receive all kinds of textile fabrics, shawls, cotton umbrellas, iron and steel goods, steel bars, lead and spelter, earthen and glass ware, all kinds of hardware and cutlery, with fire-arms, musket-flints, etc. Formerly the British trade with Siam was carried on under treaties with the East India Company. Duty was levied on the ship, and amounted to about $1000 per fathom on the width of the vessel. The length, draught, or tonnage was not regarded; there was no import or export duty; all duties and tolls were merged in the charge on the ship.

On the 20th of March, 1833, a treaty of amity and commerce was concluded between the King of Siam and the United States by Mr. Roberts, who had been sent thither for that purpose; ratifications were exchanged at Bangkok, April 14, 1836, and the proclamation of the President gave it effect in the United States June 24, 1837. By this treaty citizens of the United States are permitted to enter and depart from any port of the kingdom with cargoes of whatever description, and to buy, sell, and exchange, without qualification or restriction, except that they are not to sell munitions of war to any other person than the king, or to import opium or export rice. The only charge to be exacted from American vessels is a measurement duty of 1700 ticals or bats for every fathom of 78 American inches in breadth, upon ships selling merchandise, and of 1500 ticals or bats per fathom on those purchasing cargoes with specie; the measurement to be made in the middle of the vessel's length upon the single deck; or if there be more than one deck, then upon the lower one; but no charge is to be made upon a vessel entering merely to refit, or for refreshment, or to inquire the state of the market. In case of a reduction of the duties upon the vessels of any foreign nation, the same reduction is to be made in favor of those of the United States. American debtors, who shall have honestly brought forward and sold all their property for the payment of their debts, are not to be proceeded against for the balance remaining due after the application of the proceeds of such sale. Merchants trading to Siam shall obey the laws and customs of the country; and if they wish to rent houses, they shall rent the king's factories, and pay the customary rent therefor. The king's officers may take account of goods brought on shore, but no duties shall be levied thereon. In case of shipwreck of an American vessel on the Siamese coast, the persons escaping shall be hospitably entertained, and the property saved shall be restored to the owners; and if a vessel of the United States shall be captured by pirates, and brought into a Siamese port, the persons on board shall be set at liberty, and the property restored to the rightful proprietors. If the privilege shall hereafter be granted to any foreign nation, other than the Portuguese, to have consuls resident in the kingdom, the same privilege shall be extended to the United States.

With a few exceptions, this treaty is a mere transcript, as regards its commercial stipulations, of the treaties of Siam with the British East India Company. Anterior to the period of its conclusion, quite a number of American vessels had visited that kingdom, and it was supposed that the treaty would open an extensive trade between Siam and the United States. Quite the contrary, however, has proved to be the case; for it is stated that not a single cargo has since been shipped under the flag of the United States. In 1850 a special commissioner was sent by the government of the United States to Siam for the purpose of negotiating a new treaty, but without success. A similar result followed the efforts of Sir J. Brooke, British envoy, who had been specially deputed to proceed to Siam for the same object. Since that period, however, and very recently (April, 1855), Sir J. Bowring, for the British government, has succeeded in negotiating a new and much more favorable treaty than the one which it supersedes with the Siamese kingdom. Efforts are now in progress on the part of the United States to negotiate a new commercial treaty with this kingdom; but until such treaty shall have been formed, the United States, being entitled, by Article 4th of the treaty of 1833, to any diminution of duties payable by foreign vessels granted at any future time to any other nation, can, of course, avail itself in that regard, as well as respecting the appointment of consuls, of the British treaty of 1855.

Of the general trade and commercial relations of Siam with nations but little, comparatively, is with certainty known. The following summary respecting the principal products of that kingdom, and their commercial importance, is made up chiefly from British official returns of recent date:

Sugar is looked upon as the principal return for British imports. Its cultivation as an article of commerce originated in the enterprise of Chinese settlers in the year 1810. In 1822 it had reached 60,000 piculs, or 3700 tons; in 1835, 185,000 piculs, or 15,295 tons. At this period the trade in sugar received a severe check, in consequence of the king monopolizing the entire trade in his own hands, and fixing his own prices both for the producer and foreign purchaser. The present king has discontinued the traffic carried on by his predecessor, and cultivators are once more free to sell to any customer. The manufacture, however, still remains burdened with various taxes, which keep up the cost of production, and check demand, so that 80,000 piculs (say 5000 to 6000 tons) are now spoken of as an average crop. The land-tax on sugar plantations is one tical per square of twenty fathoms, which, under favorable circumstances, will yield four piculs. This would amount, on production, to one *salung* (15 cents) per picul (133⅓ lbs.); and the duty which is levied on sugar, on its passage to Bangkok, is exactly double the amount of the land-tax, the payment of which, under the new treaty, will free it from any further charge on exportation. Siamese sugar is much esteemed for its whiteness and fine strong grain, and as the greater portion of the valley of the Menam, the area of which has been estimated at 22,000 square miles, is stated to be well adapted to the growth of the

cane, it is supposed that the annual sugar crop would admit of very material increase.

Rice.—The extreme facility of irrigation, and the periodical inundations of the Menam, supply with unusual certainty the fertility necessary for the growth of this cereal. Hitherto its exportation was forbidden by law; but under the new treaty it is stipulated that this prohibition shall only be enforced in times of positive scarcity. The demand for this article, both for home and Oriental consumption, is constantly on the increase; and there is every prospect that Siam will, in the course of time, rival the British province of Arracan (in the Bengal presidency) in supplying this article for the markets of China, Australia, and Europe. The annual exportation of rice in this British province is now raised to 120,000 tons—nearly 800 per cent. over the total exportation of rice from the United States in 1855. The trade with Siam, however, will always have this advantage over that with Arracan, that in the former rice and all other products are given in exchange for manufactures and other articles of trade; while in the latter the exports are paid for in bullion. Forty times the amount of seed is stated as the average yield; and the ordinary price is one tical (61 cents) per 133 lbs.

Salt.—This article is obtained of excellent quality from the extensive mud-flats which line the head of the Gulf of Siam, and at so cheap a rate that the cost of production does not exceed from one to two ticals (61 cents to $1 22) per koyan of 25 piculs, or 3400 lbs. English. Salt is, however, a special object of taxation in Siam; and the duty of $3 60 per koyan raises the above-mentioned price to seven or eight ticals ($4 27 to $4 88) per koyan, equal to about $2 88 to $3 36 per ton. The British commissioner endeavored, in negotiating the late treaty, but ineffectually, to obtain a reduction of this high duty. It is, notwithstanding its price in market, in much demand at Singapore; and the Siamese government have withdrawn all impediments hitherto existing to its shipment.

Teak.—The teak forests of Siam are situated at some considerable distance up the Menam, and the trees, when felled, are floated down in large rafts to Bangkok. There is always a brisk demand for this article, both in the markets of China and Singapore.

Sapan-wood.—The annual exportation of this dye-wood reaches from 80,000 to 100,000 piculs (from 5000 to 6000 tons). Hitherto the Siamese government have levied a tax of one tical per picul on sapan-wood, being from 50 to more than 100 per cent. upon its value; and it was with great difficulty that the British commissioner persuaded the Siamese authorities to lessen this tax to 2½ salungs per picul—being a reduction of more than one-third upon the old rate.

Rose-wood and Ebony.—These woods are abundant in Siam, and are largely shipped to China and Singapore. The export duty has been reduced one-third of former rates.

Pepper.—The production of this article had reached at one time more than 9,000,000 lbs. per annum, when an oppressive tax, imposed by the present administration of Siam, of one catty of pepper on every vine, or about 8 per cent. on the produce, in addition to an export duty of one tical (61 cents) per picul, amounting to the same percentage, caused such a check to the cultivation, that last year only 20,000 piculs were brought to market. The removal of the first of these taxes, now agreed to, will serve, it is stated, to restore the growth of this useful spice to its former flourishing condition. In 1855 the United States imported from the British and Dutch East Indies 3,301,460 lbs. of black pepper, valued at $171,008.

Cotton.—Above the line of the inundated tracts, land fit for the cultivation of cotton abounds. The crop has reached as high as 140,000 piculs (8330 tons) in a year; but owing to various causes, some of which the British commissioner has succeeded in removing, it is thought that its culture will be again encouraged, and its exportation increased.

Silk.—This product has been largely grown in the rich district of Kocat, and the crop has reached 1500 piculs per annum—valued at $150,000; but the larger markets of China being so close at hand, the silk of Siam will probably never assume much importance in the foreign trade of the kingdom.

Hemp.—This article holds out much interest to foreign traders. Its growth in Siam is only just becoming known, and it is particularly recommended on account of its great strength, and its glossy and silky texture, which would allow of its being woven up into silk fabrics. Its moderate price—10 ticals ($6 10) per picul—will enable it to compete successfully with that of Manilla.

The following list will be found to contain all the manufactures which are most suited to Siamese consumption: White and grey long cloths; white and gray madapollane; white and gray cambrics; white and gray jaconets; book lappets; velvets, plain and figured; checked fancy muslins; American drills; cotton umbrellas; figured long cloths; dyed cambrics; dyed long cloths; prints, chintzes, furnitures, and neutrals; Siam *chowls*, or dresses; Turkey red cloth; gray cotton twist; Turkey red twist; imperial red and blue twist; long ells; ladies' cloth; Spanish stripes; merinos of assorted colors; canvas; iron, steel, lead, spelter; earthen-ware, assorted; glass ware and lamps, assorted; muskets, gun-locks; brimstone, beeswax; cowries, flint-stone, musket-flints, etc.

The imports from India and China are even more varied, and consist of almost every article of manufacture, trifling or important, produced in those countries; these being required not only to meet the tastes and requirements of the Siamese, but also to supply the wants of the natives of India and China, many of whom are domiciled in Siam. The statistics of the trade of Siam are but meagre. The following table exhibits the number and tonnage of ships which left the port of Bangkok for China and Singapore, from April 1, to August 31, 1855:

Destination.	Number.	Aggregate Tonnage.	Average Tonnage.
To China	11	4850	441
To Singapore.....	9	3500	389

—*U. S. Com. Relations.*

Sicily, or Two Sicilies. The kingdom of the Two Sicilies comprises the ancient realm of Naples and the island of Sicily. Naples proper embraces an area of 31,350 square miles, and, by the census of 1854, contains a population of 6,843,355 inhabitants. Its productions are of the most valuable and varied kind; and it only requires good roads to carry the produce of the soil to market, and security and encouragement under the government, to render the Neapolitan dominions among the most profitably productive in Europe. The chief products are corn, wine, olive-oil, cotton, flax, hemp, liquorice-paste, silk, and wool.

The annual crop of wheat is between 60 and 80 million bushels, and the yearly consumption is about 40 million bushels. The annual produce of Indian corn is about 40 million bushels. The yearly production of wine is about 400,000 pipes, the greater part of which is consumed at home. About 13,000 pipes are made into brandy near Naples, and from 250 to 300 tons of argol and cream of tartar are prepared for foreign markets. About 70,000 tons of olive-oil are expressed yearly, half of which is exported to foreign markets. The quantity of cotton raised annually in the continental part of the kingdom amounts to about two million pounds. In Sicily the cultivation is greater than in Naples. The annual produce of raw silk is about 1,000,000 lbs., of which one half is consumed in the factories of the kingdom.

There are two species of wheat raised in the kingdom of the Two Sicilies—the soft, of which the best quality

of bread is made; and the hard wheat, chiefly employed in the preparation of macaroni. The principal exports of Naples proper are, olive-oil, silk, hemp, wool, wine, grain, macaroni, and coral; imports, colonial and manufactured goods, iron, and cutlery.

Prior to the ratification of the treaty between the United States and the kingdom of the Two Sicilies, of December 1, 1845, the commerce between the two countries was chiefly indirect. Having no commercial treaty, the United States flag had to contend against high duties, an exemption of 10 per cent. in favor of British and French vessels employed in the direct trade, and the extreme rigor of quarantine regulations. The indirect trade was carried on through Leghorn and the French Mediterranean ports, and was necessarily fettered with the incumbrances and burdens incident to a circuitous route. Neapolitan merchandise was taken on board American ships in these ports; while colonial goods destined for the markets of the Sicilies were sold to the French and Tuscan merchants, on whose account they were shipped to their destination, or sold direct to Neapolitan traders, by whom they were introduced under the 10 per cent. discrimination. The retaliatory duties of import and tonnage levied on the Sicilian flag in the United States virtually excluded their vessels from our ports, and the consequence was that the trade between the two countries became exceedingly limited. Indeed, in returns of the foreign trade and navigation of the Two Sicilies for a period of three years (1839, 1840, and 1841), but a single American vessel appears to have entered or cleared at the ports of that kingdom.

The treaty of 1845, which went into effect July 24, 1846, provides that there shall exist between the two countries reciprocal liberty of commerce and navigation; that no higher duties shall be imposed on importations into either country of articles from the other than from any other country; that favors granted by either party to other nations shall be common to the other; that there shall be equalization of duties, etc., on imports and exports, on vessels of either country, as also of tonnage, harbor, and light-house duties; that the stipulations of the treaty shall not apply to the coasting trade; and that no preference shall be given by either party to importations on account of the national character of vessels in which imported. The treaty to be in force ten years, with the usual twelve months' notice for its termination.

By a convention ratified July 14, 1855, two principles were recognized between the two countries as permanent and immutable, to wit: 1st. That the effects or goods belonging to citizens or subjects of a power or state at war are free from capture and confiscation when found on board of neutral vessels, except articles contraband of war; and, 2d. That the property of neutrals on board an enemy's vessel is not subject to confiscation, unless contraband of war.

In 1852 the commerce of the continental part of the kingdom of the Two Sicilies is thus given: Imports, $12,372,363; exports, $10,943,831; total, $23,316,194.

The trade represented by the preceding figures passed exclusively through the custom-houses, and does not comprise the movements at the general entrepôt of Brindisi, nor the transhipment in the roads. The principal foreign powers which participated in the commercial movements of 1853 were England, France, Austria, Sardinia, the Papal States, and Tuscany; and next in the order of importance were Holland, Sweden, Russia, Spain, Greece, the Ionian Islands, Brazil, and the United States. The value of merchandise imported into the continental part of the kingdom, it is seen above, amounted to $12,372,363. This is the value of maritime commerce with foreign nations only. The coasting trade between the different ports of the kingdom would largely augment this total, but no returns of this trade are accessible. Of the imports, sugar, coffee, and trans-Atlantic produce are chiefly supplied by England. Marseilles also furnishes small quantities of sugar and coffee from French colonies; but, owing to their superior quality and high price, they are not much in demand. The sugars from Holland, being lower priced, find a readier market. Besides these sources of supply, several Neapolitan vessels have for some years past kept up a direct intercourse between the port of Naples and Brazil. There seems no reason why the United States should not compete with England, Holland, France, and even Genoa, in supplying these trans-Atlantic necessaries to the kingdom of the Two Sicilies; nor why the carrying trade in these articles from the countries of production, or from the bonded warehouses of the United States, could not be made as profitable to American as to British, Dutch, French, or even to Genoese vessels. Genoa is a free port, and the dues for pilotage, anchorage, and quarantine are light.—*See* SARDINIA.

The subjoined statement exhibits the quantities and values of sugar and coffee respectively, exported from the United States to the kingdom of the Two Sicilies, during a period of five years, from 1851 to 1855, both inclusive, made up from the annual reports of the Secretary of the Treasury on Commerce and Navigation; followed by a statement exhibiting the quantities and values of the same articles exported to all countries; and a third exhibiting the quantities and values of cotton and tobacco exported to the Two Sicilies during the same period:

Years.	Sugar.		Coffee.	
	Pounds.	Values.	Pounds.	Values.
1851	....	....	34,279	$3,340
1852	....	....	60,928	4,919
1853	....	....	91,927	7,667
1854	....	....	....	....
1855	302,990	$4542	1,830,564	170,354

COTTON AND TOBACCO EXPORTED FROM THE UNITED STATES TO THE TWO SICILIES, FROM 1851 TO 1855.

Years.	Cotton		Tobacco.	
	Pounds.	Values.	Pounds.	Values.
1851	....	....	92,060	$10,302
1852	....	....	208,000	16,619
1853	1,063,685	$66,219	22,000	2,189
1854	327,149	31,631	1,282,000	133,582
1855	1,283,492	109,724	91,000	24,124
Aggregate.	2,634,706	$227,574	1,697,060	$186,907
Average	878,235	79,191	339,400	37,361

The following are the chief staples which the Two Sicilies draw from the United States: Tobacco, cotton, rum, flour, naval stores, etc. Of these there were exported in 1854 and 1855 in value as follows:

Description of Merchandise.	1854.	1855.
Whalebone	$1,000	....
Staves and headings	11,822	$10,715
Masts, spars, and naval stores	4,895	14,440
Flour	28,791	....
Cotton	31,631	109,724
Tobacco	133,582	24,124
Rum (from molasses)	27,256	25,579

In exchange for these staples and for miscellaneous cargoes, our ships return home laden with wines, drugs, fruits, feathers, anchovies, oil, sulphur, silks, corks, and rags; of which latter article were imported in 1854, direct from the Sicilies, 3,140,718 lbs., of the value of $90,424. Under the treaty of 1845 Sicilian and United States vessels are equalized in the ports of the two countries, when laden with the produce and manufactures of the country to which the vessels belong. The direct trade is, therefore, freed from the restrictions and incumbrances with which it was clogged prior to that period, and the commerce between the two countries has in consequence largely increased. The exports from the United States of its staples alone amount now annually to between $250,000 and $300,000, more than one half of which is shipped under the United States flag. By a royal decree bearing date 18th December, 1854, the privileges which apply to the direct trade with the Two Sicilies have been equally extended to the indirect trade in favor of those nations which have

commercial treaties with the kingdom of the Sicilies, when they shall have granted like favors to the flag of the Two Sicilies.

Under the operation of the treaty already referred to, and of the liberal privileges conceded by this decree, the commerce of the United States with the Two Sicilies is increasing. The total value of exports from the Sicilies to the United States in 1845 was $530,000. In 1854 they reached nearly $1,000,000, and in 1855 they ascended to $1,718,949. In 1845 the United States exported to the Sicilies its own staples to the amount of $70,625, against $246,151 in 1854, and $207,790 in 1855. The total trade in 1855 was $2,370,425, against $1,219,351 in 1854, and $934,725 in 1845.

The port charges in the Two Sicilies are 3½ cents per ton on equalized vessels, and 32 cents per ton on those non-equalized. Besides the tonnage duty there are sundry minor charges, including custom-house visit, entrance and clearance charges, etc., amounting in the aggregate to $3 75 per vessel on entrance; and on clearance, including compensation to brokers, $5 10. The quarantine regulations require a payment of $5 for obtaining the requisite pratique. Should the vessel be subject to quarantine, the charges are largely augmented. In order to obtain free entrance, it is necessary to exhibit a clean bill of health, signed by the Neapolitan consul at the port of clearance. It would seem, however, that vessels laden with cotton or other "susceptible" merchandise have always to undergo quarantine,* which is exceedingly strict if during the voyage sickness chanced to prevail on board.

The following is a condensed summary of the latest quarantine regulations in force at the different ports of the Two Sicilies. These regulations are revised annually, but the general principles on which they are based remain unaltered:

"Vessels proceeding from New Orleans, or any port of Louisiana, shall be excluded whenever they come unprovided with a certificate signed by the royal consul at the port of departure, attesting that the yellow fever did not exist in that State, either at the period of sailing or twenty days prior to the same.

"The places *supposed* to be infected by yellow fever are the Argentine and Paraguaian republics, Demerara, Peru, Costa Firma, Gulf of Mexico, Mississippi, Great and Little Antilles, and Savannah.

"The places *suspected* of yellow fever are Santa Martha in Columbia, Chili, Guayana (except Demerara), Ohio and Missouri, Vera Cruz, and ports of the United States, except as above."

The certificate of the Sicilian consul is indispensable to be admitted to pratiquo; but even with such protection the quarantine regulations are oppressive and uncertain, especially if any sickness has occurred on board during the voyage.

Pilotage.—Vessels arriving at Naples are seldom under the necessity of taking pilots, and hence there is no fixed regulation respecting them. Should a pilot, however, be required, one can at all times be found among the fishermen on the coast, with whom the captain must make the best bargain he can.

The principal ports are Naples, situated on a bay of the same name, having a commodious harbor, and good anchorage for any sized vessels to load and discharge cargoes; and in Sicily proper, Palermo and Messina.

The foreign trade of Naples is almost exclusively in possession of English merchants. The returns for 1855 assign two-thirds of this trade to the English flag, and the other third to the Neapolitan and other flags. Some twenty or thirty vessels from the north of Europe arrive annually with stock-fish, crushed sugar, etc., from Holland. England employs annually in the trade with Naples about one hundred and thirty vessels of small size, from one to two hundred tons each, besides a line of steamers, which regularly touch at this port, to and from Liverpool. The facilities which these steamers furnish for executing orders suitable for the Neapolitan market present the most serious obstacle to a direct trade with the United States. The privilege of the indirect trade, however, lately conceded to the American flag, may tend to increase the commercial intercourse between the two countries.

The imports from Great Britain in 1855 amounted in quantity to 34,900 tons, which at 40*s.* (@9 60) per ton gave to British shippers on freight alone the sum of @335,040, besides 10 per cent. primage. The value of these imports was estimated at £3,000,000, or $15,000,000.

The exports from Naples to Great Britain were estimated at 15,500 tons, and the value at about @7,500,000.

Besides the disadvantage already referred to, under which American vessels would have to compete with English in the trade of Naples, the quarantine regulations are such as to render any enterprise in that trade on the part of American shippers uncertain and hazardous. hese regulations, as already observed, are revised annually, and provide that, under the most favorable circumstances, a certificate from the Sicilian consul at the port of departure is indispensable to be admitted to free pratique.

A few facts relative to currency and exchange at Messina, communicated to the State Department under date of October 20, 1855, by the United States consul at that port, are subjoined:

"It is customary to draw, for all transactions with the United States, on Paris or London, and occasionally on Marseilles, Hamburg, or Genoa. American coin, gold and silver, is, and has been for some time, at a discount of f om 10 to 15 per cent.

"The only kind of Spanish dollar current here is the pillar dollar, and is at an advance of about 4 per cent.

"Exchanges are very unfavorable, and far below the rates of former years. London, 1038 grains per £; Paris and Marseilles, 41¼ grains per franc; Lyons, 41⅞, and Genoa 42 grains per franc; Leghorn, 85¼ grains per lire; Amsterdam, 88¼ grains per florin; Hamburg, 78 grains per mark-banco.

"The Sicilian *ounce* is two dollars and a half, or 30 lires, or 600 grains Sicilian currency."

Island of Sicily.—This island has an area of 10,556 square miles, and a population of 2,208,392 inhabitants. Since its annexation to the kingdom of Naples in 1736, it has experienced much of the evils of absenteeism. The revenue, except that portion of it which is paid to the Neapolitan employes who reside on the island, is drained off to be spent in enriching the metropolitan court. In this respect Sicily in some degree resembles Ireland. The resources which might be beneficially expended in making roads and other improvements, indispensable to the proper development of the industry of the island and the growth of its commerce, are squandered in other countries by an absentee nobility.*

Wheat and barley are exported in small quantities. Other chief crops are beans, pulse, maize, rice, olive-oil, oranges, lemons, almonds, and other fruit; potatoes, tobacco, flax, hemp, sumach, liquorice, and manna. In the northeast part of the island silk is produced, and it is woven at Catania; and in the western part 30,000 pipes of wine are annually made, of which about 20,000 are exported from Marsala. Sulphur is also a leading staple of the island of Sicily. It is found in tertiary formations, and its production is annually increasing. From 1838 to 1842 a monopoly in the export of sulphur was granted by the Neapolitan government to a French mercantile firm; but so vigorous was the resistance of the British government, that in 1842 the monopoly was suppressed. Since that period the

* See Consular Returns, "Naples, No. 30, December 30, 1853." Part III.

* Of the whole revenue raised in Sicily (about $10,000,000), half the amount is sent direct to Naples, never to return. * * * No country exhibits land so highly taxed, nor one in which so little good is extended to the general community.—MACGREGOR.

trade in this article has been annually increasing. These sulphur mines have been explored and worked for more than three hundred years, but it was not until chemical science had pointed out the various uses to which sulphur can be applied that its exportation had risen to any great importance. There are now about 150 mines worked in an area of 2700 miles, though the most productive mines are confined to Favara, Sommatirio, Gallizzi, and Riesi.

Mr. Macgregor gives some interesting statistics of the sulphur trade of the island of Sicily, from which it appears that in 1838 the amount on hand was 80,000 quintals; on the 1st August, 1840, it had risen to 680,000 quintals; in 1841 it reached 830,000 quintals; and in 1842 it stood as high as 1,100,000 quintals.

There entered the ports of the island of Sicily in 1843, 1435 vessels of 211,000 tons; of which from the United States there were 9 of 2500 tons; and during the same year there cleared from Sicilian ports 1427 vessels of 256,000 tons; of which from the United States there were 80 vessels, measuring 22,600 tons.

The value of imports and exports during the same year was:

Imports from all foreign countries.....	$4,522,400
Exports to " "	6,594,400
Total trade.....	$11,116,800
Imports from the United States	$272,600
Exports to " "	651,000
Total trade with the United States..	$923,600

Vessels belonging to the Two Sicilies are admitted into the ports of the United States on the same terms as American vessels only when laden with the home produce or home manufactures.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Principal Port.—Palermo, anciently Panormus, a large city and sea-port, the capital of the noble island of Sicily, on the north coast of which it is situated, the light-house being in lat. 38° 8′ 15″ N., long. 13° 21′ 56″ E. Population, 170,000. The Bay of Palermo is about five miles in depth, the city being situated on its southwest shore. A fine mole, fully one quarter of a mile in length, having a light-house and battery at its extremity, projecting in a southerly direction from the arsenal into nine or ten fathoms of water, forming a convenient port, capable of containing a great number of vessels. This immense work cost about £1,000,000 sterling in its construction; but the light-house, though a splendid structure, is said to be very ill lighted. There is an inner port, which is reserved for the use of the arsenal. Ships that do not mean to go within the mole may anchor about half a mile from it, in from 16 to 23 fathoms, mole light bearing northwest three-quarters west. A heavy sea sometimes rolls into the bay, but no danger need be apprehended by ships properly found in anchors and chain cables. In going into the bay it is necessary to keep clear of the nets of the tunny fishery, for these are so strong and well moored as to be capable of arresting a ship under sail.

Money.—Since 1818 the coins of Sicily have been the same as those of Naples, their names only differing. The ducat = 3*s.* 5·2*d.* sterling, is subdivided into 100 bajocchi and 10 pirciolì; but accounts are still generally kept in oncie, tarie, and grani: 20 grani = 1 taro; 30 tari = 1 oncia; the oncia = 3 ducats; and 1 carlino of Naples = 1 taro of Sicily. The Spanish dollar is current at 12 tari 8 grani.

Weights.—100 Sicilian pounds of 12 ounces = 70 lbs. avoirdupois = 85·11 lbs. Troy = 31·76 kilog. = 64·23 lbs. of Amsterdam = 65·58 lbs. of Hamburg.

Sierra Leone, an English settlement, near the mouth of the river of the same name, on the west coast of Africa, lat. 8° 30′ N., long. 13° 5′ W. This colony was founded partly as a commercial establishment, but more from motives of humanity. It was intended to consist principally of free blacks, who, being instructed in the Christian religion, and in the arts of Europe, should become, as it were, a focus whence civilization might be diffused among the surrounding tribes. About 1200 free negroes, who, having joined the royal standard in the American war, were obliged, at the termination of that contest, to take refuge in Nova Scotia, were conveyed thither in 1792. To these were afterward added the Maroons from Jamaica; and since the legal abolition of the slave-trade, the negroes taken in the captured vessels, and liberated by the mixed commission courts, have been carried to the colony. The total population of the colony in 1850 amounted to about 55,500, all black or colored, with the exception of about 100 whites.

Success of the Efforts to civilize the Blacks.—Great efforts have been made to introduce order and industrious habits among these persons. We are sorry, however, to be obliged to add that these efforts, though prosecuted at an enormous expense of blood and treasure, have been signally unsuccessful. There is, no doubt, some discrepancy in the accounts of the progress made by the blacks. It is, however, sufficiently clear that it has been very inconsiderable, and we do not think that any other result could be rationally anticipated. Their laziness has been loudly complained of, but without reason. Men are not industrious without a motive; and most of those motives that stimulate all classes in colder climates to engage in laborious employments are unknown to the indolent inhabitants of this burning region, where clothing is of little importance, where sufficient supplies of food may be obtained with comparatively little exertion, and where more than half the necessaries and conveniences of Europeans would be positive incumbrances. And had it been otherwise, what progress could a colony be expected to make into which there have been annually imported crowds of liberated negroes, most of whom are barbarians in the lowest stage of civilization?

Influence of the Colony upon the illicit Slave-trade.—As a means of checking the prevalence of the illicit slave-trade, the establishment of a colony at Sierra Leone has been worse than useless. The trade is principally carried on with the countries round the Bight of Biafra and the Bight of Benin, many hundred miles distant from Sierra Leone; and the mortality in the captured ships during their voyage to the latter is often very great. The truth is that this traffic will never be effectually put down otherwise than by the great powers declaring it to be *piracy*, and treating those engaged in it, wherever and by whomsoever they may be found, as sea robbers or pirates. Such a declaration would be quite conformable to the spirit of the declaration put forth by the Congress of Vienna in 1824.—*See* SLAVE-TRADE. But the jealousies with respect to the right of visitation and search are so very great, that it is exceedingly doubtful whether the maritime powers will ever be brought to concur in any declaration of the kind now alluded to; unless, however, something of this sort be done, we apprehend there are but slender grounds for supposing that the trade will be speedily suppressed.

Climate of Sierra Leone.—The soil in the vicinity of Sierra Leone seems to be but of indifferent fertility, and the climate is about the most destructive that can be imagined. The mortality among the Africans sent to it seems unusually great, and among the whites it is quite excessive. Much as we desire the improvement of the blacks, we protest against its being attempted by sending our countrymen to certain destruction in this most pestiferous of all pestiferous places. It would seem, too, that it is quite unnecessary, and that blacks may be employed to fill the official situations in the colony. But if otherwise, it should be unconditionally abandoned.

Commerce.—Commercially considered, Sierra Leone appears to quite as little advantage as in other points of view. Palm-oil is the great article of export from the west coast of Africa; and by far the largest portion of it is furnished by the coast to the west and south of the Rio Volta, many hundred miles from Sierra Leone. We doubt, indeed, whether the commerce with the latter will ever be of much importance. At all events, we hardly think that it can be expected materially to increase if it be conducted in the way in which it is affirmed that the intercourse with the liberated negroes is at present conducted.—*Reports on Colonial Possessions*, 1851, p. 175. If there be not some mistake or exaggeration in the statement now referred to, nothing can be conceived more disgraceful. Should it, however, be ascertained that an establishment is really required for the advantageous prosecution of the trade to Western Africa, it is abundantly obvious that it should be placed much farther to the south than Sierra Leone. The island of Fernando Po has been suggested for this purpose; but after the dear-bought experience we have already had, it is to be hoped that nothing will be done with respect to it without mature consideration.

ACCOUNT SHOWING THE VALUE OF THE VARIOUS ARTICLES, THE GROWTH, PRODUCE, AND MANUFACTURE OF THE COLONY AND WEST COAST OF AFRICA, EXPORTED FROM SIERRA LEONE DURING EACH OF THE YEARS FROM 1848 TO 1850, INCLUSIVE.

The total value of the exports of British produce and manufacture to the west coast of Africa amounted in 1851 to £658,934; but of that amount only £94,546 went to Sierra Leone. The value of the exports from the latter to the United Kingdom during the ten years ending with 1850 amounted to £63,290 a year. The only manufacture that can be said to exist in the colony is the expression of the oil from the ground-nut by means of machinery.—*See* NUTS, GROUND. In 1850, 122 ships entered the river, of which 27 were from England.

Colonial Expenses.—The pecuniary expenses occasioned to Great Britain by this colony, and the unsuccessful efforts to suppress the foreign slave-trade, have been altogether enormous. Mr. Keith Douglas is reported to have stated in the House of Commons, in July, 1831, that "down to the year 1824 the *civil* expenses of Sierra Leone amounted to £2,268,000; and that the same expenses had amounted, from 1824 to 1830, to £1,082,000. The naval expenses, from 1807 to 1824, had been £1,630,000. The payments to Spain and Portugal, to induce them to relinquish the slave-trade, amounted to £1,230,000. The expenses on account of captured slaves were £533,092. The expenses incurred on account of the mixed commission courts

were £198,000. Altogether this establishment had cost Great Britain nearly £8,000,000!" The prodigality of this expenditure is unmatched, except by its uselessness. It is doubtful whether it has prevented a single African from being dragged into slavery, or conferred the smallest real advantage on Africa. It, however, enabled the kings of Spain and Portugal to turn their mercenary humanity to good account.—For further details with respect to Sierra Leone and the trade of Western Africa, see the *Report of the Select Committee of the House of Commons on the West Coast of Africa*, Sess. 1842, and the *Parl. Paper* for 1851.

The trade between the United States and the whole of Africa is most insignificant in comparison with that between England and simply the western coast; and it is a fact especially deserving of attention, with reference to Liberia, that for some time past, while the importations from England are increasing, from the United States they are diminishing, particularly cotton goods. It is estimated that there are not less than one hundred ships regularly trading between the British ports and the coast of Africa, while a regular line of steamers plies between England and Liberia and other settlements on the coast. In addition, it is now proposed to send a steamer up the Niger River each season for the encouragement of emigrants and the protection of traders; to secure a free port at Fernando Po, by a commercial treaty with Spain, or in some other convenient locality, as an entrepôt for British merchant ships; to maintain the African squadron in its former state of efficiency, and to make Sierra Leone a free port. The following tables show the relative importance of British and American trade with Africa:

THE TRADE OF THE UNITED STATES WITH AFRICA DURING THE NINE YEARS ENDING JUNE 30, 1857.

Years.	Exports.	Imports.	Total.
1849	$708,411	$495,742	$1,204,153
1850	759,266	524,722	1,283,988
1851	1,340,644	1,163,176	2,503,820
1852	1,246,141	1,057,657	2,303,798
1853	1,610,833	1,202,986	2,813,819
1854	1,894,972	1,296,560	3,191,532
1855	1,375,005	1,337,527	2,713,432
1856	1,795,419	1,165,857	2,961,276
1857	2,484,746	1,521,665	4,006,411

The amount of tonnage cleared from the United States was as follows:

Year ending June 30.	Tonnage cleared.	
	American.	Foreign.
1850	18,077	1075
1857	22,000	742

The following returns to Parliament (as published by the London *Shipping and Mercantile Gazette*) show the increase of exports by Great Britain to the west coast of Africa, and of imports from the same coast:

Years.	Exports.	Imports.	Total.
1850	£939,479	£905,958	£1,845,387
1851	654,543	794,810	1,449,353
1852	533,725	707,024	1,240,749
1853	901,402	749,373	1,650,775
1854	768,809	905,634	1,564,443

This is independent of the British colonies of Sierra Leone, the trade of which amounted in 1854 to £1,421,865, and of the British possessions on the Gold Coast and the River Gambia, amounting to £1,547,285 more; and of those at the Cape of Good Hope and in South Africa, swelling the amount £8,383,090 more; making in all an aggregate of over £23,000,000 in 1854 for the western coast of Africa entire.—*See* BLACKWOOD'S *Magazine*, xxiii. 63, xii. 693; *Monthly Review*, cxxiii. 188; HUNT'S *Merchants' Magazine*, xv. 572; *Edinburgh Review*, lii. 355.

Silk (Lat. *Sericum*, from *Seres*, the supposed ancient name of the Chinese), a fine glossy thread or filament spun by various species of caterpillars or larvæ of the *phalæna* genus. Of these the *Phalæna atlas* produces the greatest quantity; but the *Phalæna bombyx* is that commonly employed for this purpose in Europe. The silk-worm, in its caterpillar state, which may be considered as the first stage of its existence, after acquiring its full growth (about three inches in length), proceeds to inclose itself in an oval-shaped ball or cocoon, which is formed by an exceedingly slender and long filament of fine yellow silk, emitted from the stomach of the insect preparatory to its assuming the shape of the chrysalis or moth. In this latter stage, after emancipating itself from its silken prison, it seeks its mate, which has undergone a similar transformation; and in two or three days afterward, the female having deposited her eggs (from 300 to 500 in number), both insects terminate their existence. According to Reaumur, the *phalæna* is not the only insect that affords this material—several species of the *aranea*, or spider, inclose their eggs in very fine silk.

Raw silk is produced by the operation of winding off at the same time several of the balls or cocoons (which are immersed in hot water to soften the natural gum on the filament) on a common reel, thereby forming one smooth even thread. When the skein is dry, it is taken from the reel and made up into hanks; but before it is fit for weaving, and in order to enable it to undergo the process of dyeing without furring up or separating the fibres, it is converted into one of three forms, viz., *singles*, *tram*, or *organzine*.

Singles (a collective noun) is formed of *one* of the reeled threads being twisted, in order to give it strength and firmness.

Tram is formed of two or more threads twisted together. In this state it is commonly used in weaving, as the *shoot* or *weft*.

Thrown silk is formed of two, three, or more singles, according to the substance required, being twisted together in a *contrary* direction to that in which the singles of which it is composed are twisted. This process is termed organizing, and the silk so twisted *organzine*. The art of throwing was originally confined to Italy, where it was kept a secret for a long period. Stow says it was known in England since the 5th of Queen Elizabeth, "when it was gained from the strangers;" and in that year (1562) the silk throwsters of the metropolis were united into a fellowship. They were incorporated in the year 1629, but the art continued to be very imperfect in that country until 1719.

Dates of the Introduction of Silk.—Wrought silk was brought from Persia to Greece 325 B.C. Known at Rome in Tiberius's time, when a law passed in the Senate prohibiting the use of plate of massy gold, and also forbidding men to debase themselves by wearing silk, fit only for women. Heliogabalus first wore a garment of silk A.D. 220. Silk was at first of the same value with gold, weight for weight, and was thought to grow in the same manner as cotton on trees. Silk-worms were brought from India to Europe in the 6th century. Charlemagne sent Offa, king of Mercia, a present of two silken vests A.D. 780. The manufacture was encouraged by Roger, king of Sicily, at Palermo, 1130, when the Sicilians not only bred the silk-worms, but spun and weaved the silk. The manufacture spread into Italy and Spain, and also into the south of France, a little before the reign of Francis I., about 1510; and Henry IV. propagated mulberry-trees and silk-worms throughout the kingdom, 1589. In England silk mantles were worn by some noblemen's ladies at a ball at Kenilworth Castle, 1286. Silk was worn by the English clergy in 1534. Manufactured in England in 1604, and broad silk wove from raw silk in 1620. First attempt to introduce the silk culture into the American colonies by James I., year 1622. Brought to perfection by the French refugees in London at Spitalfields, 1688. A silk-throwing mill was made in England, and fixed up at Derby, by Sir Thomas Lombe, merchant of London, modeled from the original mill then in the King of Sardinia's dominions, about 1714.—HAYDN.

Historical Sketch.—The art of rearing silk-worms, of unraveling the threads spun by them, and manufacturing the latter into articles of dress and ornament, seems to have been first practiced by the Chinese. Virgil is the earliest of the Roman writers who has been supposed to allude to the production of silk in China, and the terms he employs show how little was then known at Rome of the real nature of the article:

"Vellera quæ ut foliis depectant tenuia Seres."—*Georg.* lib. ii. lin. 121.

But it may be doubted whether Virgil do not in this line refer to cotton rather than silk. Pliny, however, has distinctly described the formation of silk by the *bombyx.*—*Hist. Nat.* It is uncertain when it first began to be introduced at Rome; but it was most probably in the age of Pompey and Julius Cæsar—the latter of whom displayed a profusion of silks in some of the magnificent theatrical spectacles with which he sought to conciliate and amuse the people. Owing principally, no doubt, to the great distance of China from Rome, and to the difficulties in the way of the intercourse with that country, which was carried on by land in caravans whose route lay through the Persian empire, and partly, perhaps, to the high price of silk in China, its cost, when it arrived at Rome, was very great; so much so that a given weight of silk was sometimes sold for an equal weight of gold; at first it was only used by a few ladies eminent for their rank and opulence. In the beginning of the reign of Tiberius, a law was passed, *ne vestis serica viros fœdaret* —that no man should disgrace himself by wearing a silken garment.—Tacitus, *Annal.* But the profligate Heliogabalus despised this law, and was the first of the Roman emperors who wore a dress composed wholly of silk (*holosericum*). The example once set, the custom of wearing silk soon became general among the wealthy citizens of Rome, and throughout the provinces. According as the demand for the article increased, efforts were made to import larger quantities; and the price seems to have progressively declined from the reign of Aurelian. That this must have been the case is obvious from the statement of Ammianus Marcellinus, that silk was in his time (anno 370) very generally worn, even by the lowest classes. *Sericum ad usum antehac nobilium, nunc etiam infimorum sine ullâ discretione proficiens.*—Lib. xviii.

China continued to draw considerable sums from the Roman empire in return for silk, now become indispensable to the Western World, till the 6th century. About the year 550, two Persian monks, who had long resided in China and made themselves acquainted with the mode of rearing the silk-worm, encouraged by the gifts and promises of Justinian, succeeded in carrying the eggs of the insect to Constantinople. Under their direction they were hatched and fed; they lived and labored in a foreign climate; a sufficient number of butterflies was saved to propagate the race, and mulberry-trees were planted to afford nourishment to the rising generations. A new and important branch of industry was thus established in Europe. Experience and reflection gradually corrected the errors of a new attempt; and the Sogdoite embassadors acknowledged in the succeeding reign that the Romans were not inferior to the natives of China in the education of the insects and the manufacture of silk.—Gibbon, *Decline and Fall.* Greece, particularly the Peloponnesus, was early distinguished by the rearing of silk-worms, and by the skill and success with which the inhabitants of Thebes, Corinth, and Argos carried on the manufacture. Until the 12th century, Greece continued to be the only European country in which these arts were practiced; but the forces of Roger, king of Sicily, having in 1147 sacked Corinth, Athens, and Thebes, carried off large numbers of the inhabitants to Palermo, who introduced the culture of the worm and the manufacture of silk into Sicily. From this Island the arts spread into Italy; and Venice, Milan, Florence, Lucca, etc., were soon after distinguished for their success in raising silk-worms, and for the extent and beauty of their manufactures of silk.—Gibbon, vol. x. p. 110; *Biographie Universelle*, art. Roger II. The silk manufacture was introduced into France in 1480, Louis XI. having invited workmen from Italy, who established themselves in Tours. The manufacture was not begun at Lyons till about 1520, when Francis I., having got possession of Milan, prevailed on some artisans of the latter city to establish themselves, under his protection, in the former. Nearly at the same period the rearing of silk-worms began to be successfully prosecuted in Provence and other provinces of the south of France. Henry IV. rewarded such of the early manufacturers as had supported and pursued the trade for twelve years with patents of nobility.

One circumstance distinguishes silk from the other three great sources of textile fabrics; viz., the silk is already a continuous filament before it reaches the hands of the manufacturer; whereas cotton, wool, and flax are all short in the fibre; and these fibres have to be combined end to end by spinning. The little silk-worm, intent upon making a warm habitation for himself, wraps or builds around him a cocoon or small egg-shaped hollow envelope, fabricated of one very long and exquisitely-fine filament of silk. This filament the silk growers—whether in Italy, Turkey, China, or India (these being the chief silk-producing countries)—unwind by various ingenious means; and many filaments are then combined into one to form a thread sufficiently strong to form into hanks or skeins. Such silk is called raw silk, and in this state most of our supply is obtained. It thence follows that the twisting and spinning machinery differs from that employed for the other three kinds of fibre mentioned above. The silk is transferred from hanks to reels, round which it is wound. It is twisted, and wound, and doubled, and wound again, and transferred from one machine to another, until there is sufficient thickness to form a thread for weaving or for sewing, and sufficient twist to give it strength.

A document of particular interest has been published, showing the arrivals of raw silk in Great Britain in each of the fifteen years from 1842 to 1856 inclusive. The entire figures are too extended for insertion, but the following abstract embodies the principal points of interest. The most remarkable feature is that, while China sent to Great Britain only 180,124 lbs. in 1842, the supply furnished by her amounted to 4,576,706 lbs. in 1854, and in 1856 was 3,723,693 lbs., notwithstanding the shipment of a large portion of her crop direct to France in consequence of the failure in that country. The next most important imports are those of Egypt. Fifteen years back—namely, in 1842—the quantity thence was 1 lb., and in 1856 it was 2,514,356 lbs. The East Indian supply has gradually declined, the crops in Bengal for the past few years having been unsatisfactory. From France, in 1842, Great Britain obtained 1,156,498 lbs., and in 1856 only 157,559 lbs. So far from having any to spare, the French manufacturers were compelled to draw upon the stocks in other countries. The imports from Italy have been similarly affected. Those from Turkey have also diminished, but this is to be attributed to the French demand. Among the countries that Great Britain has drawn upon are the United States, but the small quantities obtained must have been of Chinese growth. The supplies from Holland and Belgium, it is also assumed, must have come originally either from the Indian Archipelago or France. It appears that the largest importation ever known was in 1854, when the total was 7,535,407 lbs. Last year, however, it was almost as great, and, as prices have advanced in the two years more than 50 per cent., the money value was proportionately beyond all former precedent.

The following is an official summary of the British importations of raw silks for the years 1852-1856:

IMPORTS OF RAW SILKS INTO THE UNITED KINGDOM FOR EACH YEAR, 1852, 1853, 1854, 1855, 1856.

Total	£1,255,641	£1,326,778	£1,551,866

The silk exported from Canton consists of two leading varieties, known in commerce by the names of Canton and Nankin. The first, which is raised principally in the province of Canton, is divided into five sorts. The Nankin silk, produced in the province of Kiangnan, is divided into two sorts, known in commerce by the names of Tsatlee and Tuysaam. It is very superior to the other, and usually fetches more than double its price. East India native silk comes wholly from Bengal. About the year 1760, the East India Company introduced the Italian mode of reeling silk, which was productive of a very great improvement in the quality of the article; but we are not aware that any subsequent improvement has been effected. The silk goods brought from India are not only inferior, in point of quality, to those of Europe, but also to those of China. Turkey silk wholly consisted, some years back, of what is termed long reel and short reel brutia, a rather coarse description, suited to few buyers, and chiefly used in the ribbon trade of Coventry; but of late it has been imported of a very far superior texture and quality, coming successfully into competition with Italian and China silk. The qualities now known as brutias may be classed as follows; viz., long reel brutia, short reel brutia, long reel Mestup (being a finer thread than common brutia), short reel Mestup, Selè (a finer sort, generally in loose skeins) Demirdask (a superior kind). At Brussa, the seat of the silk trade in Asia Minor, it is now sold by the oke of 400 drams, and not by the teffee of 610 drams, as formerly: the teffee is, however, still used at Constantinople. The plains of Brussa and the adjacent villages produce different qualities, varying considerably in size, color, and quality. The village of Demirdask produces the finest, owing to the care taken by the natives in selecting the best cocoons, and attending carefully to the evenness of the thread throughout the process of reeling; consequently this description commands a high price, and is approved by our throwsters.

The water of this place is considered favorable to the brightness and glossiness of the silk, by which it may be distinguished from that of Brussa. The silk at Brussa is taken by the country people in small parcels to the bechestar or customs, where it pays duty. The proprietor, with a broker, then takes it to the silk bazar, where it is handed round to the different stands and sold to the highest bidder, resembling in this respect the mode of selling the ores in Cornwall to the different smelters.

Thus a person buying several okes at a time, assorts as well as he can the different qualities for packing. It is generally bought by speculators for the Constantinople market, and is forwarded to Ghemlek on camels for shipment per steamers to Constantinople, where it finds its way to the Mizam, or some broker's rooms, where it is sold to the different merchants. The finest longs are mostly bought for the French and Russian markets, generally the latter. The long reels are going out of use in this country, as the more modern machinery is not adapted to its use.

The prices of silk at Brussa in September, 1842, were:

1st quality Demirdask	$235	to	$240	per oke of 400 drams.
2d " "	210	to	215	" "
1st Selè	190	to	193	" "
2d Selè	180	to	185	" "
Long Mestups	165	to	...	" "

By far the greater part of the raw and thrown silk that comes from France is not the growth of that country, but of Italy; being principally conveyed by the canal of Languedoc and the Garonne to Bordeaux, whence it is shipped for England. So much is this the case, that it appears from the official accounts published by the French government, that while the aggregate quantity of the French and foreign raw and thrown silk exported from France in 1841 amounted to 1,074,144 kilograms, the portion which was of French origin amounted to only 12,294 kilograms!—*Administration des Douanes*, 1841, p. 241.

We have before us an interesting report on the production of silk, submitted to the Academy of Sciences by M. Dumas, to whom was referred a paper on the subject drawn up by M. André Jean, one of the most experienced silk growers, and for some time engaged with the most commendable perseverance and signal success in the improvement of the different varieties of silk-worms. The observations of the learned author of the report are based mainly upon the important fact that the production of cocoons in France has diminished from 26,000,000 of kilograms (about 58,500,000 lbs.) in 1853 to 7,500,000 (about 16,750,000) in 1856. To comprehend in its proper light the full effect of similar diminutions, in view of a continued and constantly increasing consumption, we must inquire what are the limits to which the production of silk extends? The aggregate production of silk in the world may be estimated at a value of at least 1,000,000,000 francs, or nearly $200,000,000. Of this sum a little over one-third is assigned to Europe, and the balance to Asia.

Annual Production of Silk in the World.

	Francs.
France	108,000,000
Italian States	281,500,000
Other countries, chiefly Spain	24,500,000
Total for Europe	414,000,000
China	425,000,000
India	120,000,000
Japan	80,000,000
Persia	23,000,000
Countries of Asia	54,800,000
Total of Asia	702,800,000
Africa	1,100,000
Oceanica	600,000
America	500,000
Aggregate total, francs	1,119,000,000

If these figures are accurate, must we not conclude from them that the aggregate quantity of silk available in commercial movements is exceedingly limited, and that a general uneasiness in the silk markets must result from any failure in the cocooneries of Italy, where one-fourth of all the silk in the world is produced, or in those even of France, which yield about one-tenth of the whole production? The falling off in the production of cocoons in France, which we have already indicated, would represent a diminution in value of from 100,000,000 of francs to 25,000,000 had the price of cocoons remained the same at both periods—namely, 1853 and 1856. But the movements of commerce have been so powerless in replacing the deficit of 19,000,000 of kilograms (nearly 42,750,000 pounds), that the price has advanced from 4 francs 50 centimes (84 cents) to 8 francs (*$1 19) per kilogram (2·20 lbs.), so that the loss falls equally upon the producer and the consumer. —For the exports of silk from China, *see articles* China, Canton, and Shanghai.

Silk Manufacture in the United States.—The introduction of silk culture into the North American colonies dates back to the first settlement of Virginia. James I., who was anxious to promote this branch of industry, several times urged the "London Company" to encourage the growth of mulberry-trees, and addressed a letter to them on the subject in 1622, conveying strict injunctions that they should use every exertion for this purpose, and stimulated the colonists to apply themselves diligently and promptly to the breeding of silk-worms, and the establishment of silk works, bestowing their labors rather in producing this rich commodity than to the growth of tobacco—an article to which his majesty had recorded and published his violent aversion. The company thus incited, showed much zeal in their endeavors to accomplish the king's wishes. A considerable number of mulberry-trees was planted; but little silk was produced, owing to difficulties involved by their dissolution soon after. In about the year 1651 the rearing of silk-worms again became a subject of interest in Virginia, and premiums were offered for its encouragement; but it does not appear that the business was ever prosecuted to any extent. The silk culture was introduced into Louisiana in 1718 by the "Company of the West." In the infant settlement of Georgia, in 1732, a piece of ground belonging to government was allotted as a nursery plantation for white mulberry-trees, and the attention of some of the settlers was soon engaged in rearing silk-worms. In 1726 a quantity of raw silk was raised in that colony, which was manufactured into a piece of stuff, and presented to the queen.

In 1749 an act of Parliament was passed for encouraging the growth of silk in Georgia and Carolina, exempting the producer from the payment of duties on importation into London. A bounty was also offered for the production of silk, and a man named Ortolengi, from Italy, was employed to instruct the colonists in the Italian mode of management. A few years before the Revolution considerable quantities of raw material began to be raised, which was said to be equal, in some cases, to the best Piedmont silk, and worked with less waste than the Chinese article.

In Carolina the culture was undertaken by the small farmers. In 1766 the House of Assembly of this province voted the sum of £1000 toward the establishment of a silk filature at Charleston, under the direction of Mr. Gilbert.

In Connecticut, attention was first directed to the rearing of silk-worms in 1760. Dr. Aspinwall, of Mansfield, from motives of patriotism, used his best exertions to introduce this important branch of rural economy. He succeeded in forming extensive nurseries of the mulberry at New Haven, Long Island, Pennsylvania, and other places. Half an ounce of mulberry seeds was sent to each parish in the colony, with such directions as his knowledge of the business enabled him to impart. In 1783 the Legislature of Connecticut passed an act granting a bounty on mulberry-trees and raw silk. It may here be stated to the honor of Connecticut that she is the only State in the Union which has continued the business without suspension, and probably has produced more silk, from the time of her commencement up to the year 1830, than all the other States.

In the year 1769, on the recommendation of Dr. Franklin, through the American Philosophical Society, a filature of raw silk was established in Philadelphia, by private subscription, and placed under the direction of an intelligent and skillful Frenchman, who, it is said, produced samples of reeled silk not inferior in quality to the best from France and Italy. In 1771 the managers purchased 2300 lbs. of cocoons—all the product of Pennsylvania, New Jersey, and Delaware. The enterprise was interrupted by the Revolution. A similar undertaking was again attempted in Philadelphia in 1830, under the supervision of M. J. D'Homergue, and cocoons were brought in abundance to the establishment from various parts of the country, and so continued for some time afterward; but for want of capital the enterprise failed.

In about the year 1831 the project of rearing silk-worms and establishing filatures of silk was renewed in various parts of the Union, and the subject was deemed to be of so much importance, that it not only attracted the attention of Congress, but afterward received encouragement from the Legislatures of several

States, by bounties offered for all the raw silk produced within their limits for certain periods of time. The business soon began to be prosecuted with extreme ardor, and continued for several years, resulting in the establishment of several nurseries of mulberry-trees, and ending in the downfall of the famous "Morus Multicaulis speculation," in 1845.

The amount of raw silk exported from Georgia in 1750 was 118 lbs.; in 1755, 138 lbs.; in 1760, 558 lbs.; in 1766, more than 20,000 lbs; in 1770, 290 lbs. From South Carolina, in 1772, 455 lbs. In the year 1765, there were raised on Silk Hope Plantation, in South Carolina, 630 lbs. of cocoons; in Mansfield, Connecticut, in 1793, 265 lbs. of raw silk; in 1827, 2430 lbs.; in 1831, 10,000 lbs.; in Connecticut, in 1844, 176,210 lbs.; in the United States, the same year, 396,790 lbs.

A remarkable circumstance is said to have occurred in the silk factory of M. Garibaldi, at Cremona. It is stated that in this factory a quantity of silk-worms, instead of forming the cocoon as usual, actually wove a kind of silk ribbon, of the breadth of an inch and the length of twelve feet.—*Year-Book of Facts*, 1857.

According to the census returns of 1840, the amount of silk cocoons raised in the United States was 61,552 lbs.; of 1850, 10,843 lbs. From the above it is obvious that the production of cocoons has decreased, since 1840, 46,709 lbs.; and since 1844, 382,027 lbs.

The following is the comparative total receipts of foreign silk goods at all the ports of the United States during the years 1854, 1855, 1856:

	1854.	1855.	1856.
Raw silk	$1,085,261	$742,251	$991,234
Silk piece goods	25,296,510	20,063,957	25,200,654
Hosiery and articles made on frames	1,001,299	451,003	611,298
Sewing silk	332,301	189,220	250,138
Silks, tamboured or embroidered	1,183,299	800,000	1,500,000
Silk hats and bonnets	106,139	110,586	102,827
Silk floss	14,078	9,366	16,498
Bolting cloths	48,868	60,984	70,146
Silk and worsted goods	1,504,038	1,133,839	1,335,247
Silks unspecified	6,728,906	3,480,716	3,974,974
Total imp. silks	$37,490,205	$27,052,612	$34,053,013

By the British tariff, knubs or husks of silk and waste silk, raw and thrown silk, dyed, single or tram silk, dyed organzine or crape silk, may be imported duty free; manufactures of silk generally 15 per cent. *ad valorem*.

The following table exhibits the population, consumption of imported silk, and the allotment per capita thereof; consumption of imported manufactures of silk, and the per capita thereof, and the total home consumption of importations of silk and manufactures of silk in the United States, with the allotment per capita thereof for the years 1840, 1850, and 1855; also, the production of silk in the United States, and the allotment per capita thereof, and the total consumption of foreign and domestic silk and foreign manufactures of silk in the United States, and the allotment per capita thereof, for the years 1840 and 1850:

United States.	1840.	1850.	1855.
Population	17,069,453	23,191,876	27,185,511
Consumption of imported raw silk	$33,996 00	$393,977 00	$680,495 00
Allotment per capita thereof	20	1 69	2 50
Consumption of imported manufactures of silk	8,585,990 00	17,286,987 00	23,464,421 00
Allotment per capita thereof	50 30	74 46	86 31
Home consumption of imported raw and manufactured silk	8,619,986 00	17,680,964 00	24,144,916 00
Allotment per capita thereof	50 50	76 15	88 81
Production of silk in the United States	61,653 00	10,843 00	(*)
Allotment per capita thereof	36	05	.....
Total consumption of silk	8,681,639 00	17,691,807 00	.....
Allotment per capita thereof	50 86	76 20	.....

* The census of 1855 does not furnish the manufactures of silk in the United States.

Silk-cotton. A beautiful silky kind of cotton is obtained from the *Bombax* and other trees; it is short and remarkably elastic, and would be very largely used were it not fragile and tender. The Hindoos spin it into a loose, course, warm kind of cloth. In Europe it has not yet been much employed; but in America a method has been discovered of applying it as a covering for so-called silk hats, for which it is said to be admirably adapted. As there is an almost boundless supply of the trees yielding these delicate fibres, there may here be a great manufacture in the future.

Silver (Ger. *Silber*; Du. *Zilver*; Da. *Solv*, Swed. *Silfver*; Fr. *Argent*; It. *Argento*; Sp. *Plata*; Port. *Prata*; Russ. *Serebro*; Pol. *Srebro*; Lat. *Argentum*; Gr. ἄργυρος; Arab. *Fuzzeh*), a metal of a fine white color, without either taste or smell; being in point of brilliancy inferior to none of the metallic bodies, if we except polished steel. It is softer than copper, but harder than gold. When melted its specific gravity is 10·474; when hammered, 10·51. In malleability it is inferior to none of the metals, if we except gold. It may be beaten out into leaves only $\frac{1}{100000}$ of an inch thick. Its ductility is equally remarkable: it may be drawn out into wire much finer than a human hair; so fine, indeed, that a single grain of silver may be extended about 400 feet in length. Its tenacity is such, that a wire of silver 0·078 inch in diameter is capable of supporting a weight of 187·13 lbs. avoirdupois without breaking. Silver is easily alloyed with copper by fusion. The compound is harder and more sonorous than silver, and retains its white color even when the proportion of copper exceeds one half. The hardness is at a maximum when the copper amounts to *one-fifth* of the silver. The standard or sterling silver of Britain, of which coin is made, is a compound of $12\frac{1}{2}$ parts silver and 1 copper. Its specific gravity is 10·2. The specific gravity of Paris standard silver, composed of 137 parts silver and 7 copper, is 10·175. The French silver coin during the old government was not nearly so fine, being composed of 261 parts silver and 27 copper, or $9\frac{3}{4}$ parts silver to 1 part copper. The Austrian silver coin contains $\frac{1.3}{28.3}$ of copper. The silver coin of the ancients was nearly pure, and appears not to have been mixed with alloy.—THOMSON'S *Chemistry*.

The most productive silver mines are in America, particularly in Mexico and Peru. There are also silver mines in Hungary, Saxony, Spain, and other parts of Europe, and in Asiatic Russia.—*See* PRECIOUS METALS.

Besides being used as a coin, or money, silver is ex-

tensively employed in the arts. The value of the silver plate annually manufactured is very considerable. Large quantities are also used in plating. Silver exists in most parts of the world, and is found mixed with other ores in various mines in Great Britain. The silver mines of South America are far the richest. A mine was discovered in the district of La Paz in 1660, which was so rich that the silver of it was often cut with a chisel. In 1749 one mass of silver, weighing 370 lbs., was sent to Spain. From a mine in Norway a piece of silver was dug, and sent to the Royal Museum at Copenhagen, weighing 560 lbs., and worth £1680. In England silver plate and vessels were first used by Wilfrid, a Northumberland bishop, a lofty and ambitious man, A.D. 709.—TYRELL'S *Hist. of England.* Silver knives, spoons, and cups were great luxuries in 1300.

Silver Coin. Silver was first coined by the Lydians, some say; others, by Phidon of Argos, 869 B.C. At Rome it was first coined by Fabius Pictor, 269 B.C. Used in Britain 25 B.C. The Saxons coined silver pennies, which were 22½ grains weight. In 1302 the penny was yet the largest silver coin in England.—*See* SHILLINGS, etc., and COIN.

The scarcity of silver in Western Europe, including Great Britain, and in this country, has given rise to the question, "Where does the silver go?" In connection with this question, we make the following extract from a paper read by Prof. R. H. Walsh, of the Dublin University:

At the time when Pliny termed it the sink of the precious metals, silver was a favorite article of export to the East. It has continued so since, but the trade of late has assumed an extraordinary magnitude. In the five years prior to 1856 over $110,000,000 worth of silver have been exported to the East through England alone, and from other countries a similar movement has been in operation. The export in 1825 was $32,000,000, and this year (1856) it is proceeding at the rate of over $45,000,000 per annum, judging from the returns that have been published for the first four months. Unlike the old movement, the present can not be permanent. The former was seldom more than might be accounted for as the distribution of silver to some of its chief consumers—the nations of the East—according as new supplies were raised elsewhere. It was, in fact, the ordinary movement from the producer to the consumer. Humboldt estimated the annual production of silver in Mexico at 1,184,000 lbs., or about $25,000,000.

But now silver goes faster to the East than it is produced throughout the world. Hence the process can not be permanent, but must come to an end as soon as the redistribution of the old stock has been effected; for the annual production of silver is only about $40,000,000; and since the export to the East through England alone is at the rate of over $45,000,000, it follows that it can not be the new supplies of silver which meet that demand and all others for the same metal, but that there must be some auxiliary fund to be drawn upon. Such a fund is furnished by a cessation in the demand for silver in several countries which before employed it most largely, but now use gold instead. Silver, which used to be coined in France and the United States at an average rate of $20,000,000 per annum, is now little employed, while much of the old coin of that metal is melted down and exported. In France, it is said that in one year (1853) so much as $60,000,000 were disposed of in this manner, and that the operation has been since proceeding at a still greater rate. In Mexico there are eight or nine mints, one of which is national, having one general law of coinage, but independent of each other, and subject to no general control. There are some characteristic differences in respect to grades of fineness and accuracy, but they seem not sufficient to call for a distinction, as the only external means of identifying is in the mint mark.

SILVER OF DOMESTIC PRODUCTION, INCLUDING SILVER PARTED FROM CALIFORNIA GOLD, DEPOSITED AT THE MINT OF THE UNITED STATES, ITS BRANCHES, AND THE ASSAY OFFICE, NEW YORK, FROM JANUARY, 1841, TO JUNE 30, 1857 (THAT FOR 1857 BEING SIX MONTHS ONLY, TO JUNE 30).

Years.	Value.	Years.	Value.
1841	$4,300	1850	$203,253
1842	6,453	1851	389,471

Total.	$18,950,841	$391,075	$8,045,000	$27,386,916

Silver Mines of Mexico.—It is not generally known in this country that the silver mines of Mexico, which yielded to the Spaniards, between the conquest by Cortez and their expulsion by the Mexicans in 1827, $2,028,000,000, as shown by the records of the Mints, have since that period steadily and rapidly increased their product, until from an annual yield of about $20,000,000 it has risen, according to some authorities, to upward of $40,000,000 in 1856. We have no official data upon which to affirm or deny this. This vast product is from the working of a very small number of mines, while that portion of Mexico north of latitude 24°, and on our own frontier, which, according to Baron Humboldt and others, contains the richest veins —often beginning near the surface, and above water-level, and sometimes yielding vast quantities of pure native silver—have lain for many years entirely unworked and neglected. This has been in consequence of the inability of the few Mexicans scattered over those regions to cope with the wild Apache and Camanche Indians, who have held free scope there until within a few years past. They are now kept out from the states near the lower part of the Rio Grande by the filling up of the country, and by the vicinity of our newly-established military posts. Up to this time the only foreigners who have availed themselves of the opportunities of amassing fortunes from these mines are the English, and a few Germans; and they have confined themselves principally to the poorer veins of the thickly-settled Central and Southern parts of Mexico. But they are now meeting with the rewards of their enterprise.

Recently, several companies have been formed in the United States for working mines in Northern Mexico and Arizona. One of these is composed, in part, of officers of our army, who have seen and examined the localities, and some of whom have resigned their commissions for the purpose of devoting their time to the opening of these mines. Those in Arizona are so far distant, and in a country so uncultivated and so beset by Indians, that it may be the work of time and of much expense to overcome these obstacles. But that American enterprise will finally overcome them none can doubt. On the Lower Rio Grande, however, in the state of Nuevo Leon, within forty-five miles of steamboat navigation, and but forty-five miles from the Texas line, and but four days' sail from New Orleans, are some of the richest mines in the Republic of Mexico. One of these is being reopened by a very strong New York company, called the Vallecillio, and with good prospects of large returns.—*Letter from New Mexico.* *See articles* MEXICO, PRECIOUS METALS, and COINS for more extended information in regard to the production of silver.

The product of silver at different periods of the present century is estimated as follows:

	1800.	1850.	1856.
America.....	$32,891,000	$29,120,000	$30,500,000
Europe.....	4,000,000	7,280,000	8,000,000
Asia.....	....	4,100,000	5,000,000
Africa.....	400,000	....	....
Total.....	$37,291,000	$40,500,000	$43,500,000

In regard to the production of silver in Mexico, it appears that the amount of coinage in that country in 1851 was $23,166,000, of which $2,004,000 was in silver. From the year 1690 to 1800 the production of the gold and silver mines of Mexico is estimated at $1,351,000,000, and from 1800 to 1856 at $160,000,000, as the production of the silver mines alone.

Singapore, an island and British settlement at the eastern extremity of the Straits of Malacca, the town being in lat. 1° 17′ 22″ N., long. 103° 51′ 45″ E. The island is of an elliptical form, about 27 miles in its greatest length, and 11 in breadth, containing an estimated area of 275 square miles. But the whole British settlement embraces a circumference of above 120 miles; in which are included about 50 desert islets, and the seas and straits within 10 miles of the coast of the principal island. The latter is separated from the main land by a strait of the same name, of small breadth throughout, and scarcely, indeed, a quarter of a mile wide in its narrowest part, which, in the early period of European navigation, was the thoroughfare between India and China. But the grand commercial highway between the eastern and western portions of maritime Asia now passes along the south side of the island, on which the town is built, between it and a chain of desert islands about 9 miles distant; the safest and most convenient channel being so near to the island that ships in passing and repassing come close to the roads. The town is wholly indebted for its rapid rise and growing importance to its position on this strait. This has rendered it not merely a convenient entrepôt for the trade between the Western World and India on the one hand, and China on the other, but also for that between the former and the Eastern Archipelago, the Philippines, etc. It is situated on a river, or rather salt creek, navigable by lighters about three quarters of a mile from the sea. Ships lie in the roads, or open harbor, at the distance of from 1 to 2 miles from town, according to their draught of water. The assistance of a number of convenient lighters, which are always in readiness, enables them to load or unload, with scarcely any interruption, throughout the year. The creek is accessible to the lighters, and the goods are taken in and discharged at convenient quays, at the doors of the principal warehouses.

The climate of Singapore, though hot, is healthy. Fahrenheit's thermometer ranges from 71° to 89°. Being only about 80 miles from the equator, there is, of course, very little variety in the seasons. There is neither summer nor winter; and even the periodical rains are short, and not very well marked—moderate showers of rain falling for about 150 days each year. The settlement of Singapore was formed in February, 1819, and its sovereignty and property, in their present extent, confirmed to the British government in 1825, by a convention with the King of the Netherlands, and a treaty with the Malay princes to whom it belonged. Previously to its being taken possession of by the English, it had been inhabited for about eight years by a colony of Malays, half fishermen and half pirates. When the first census was taken in January, 1824, the population was found to amount to 10,683. In 1828 it had increased to 15,834, in both cases exclusive of troops, camp followers, Indian convicts, and a floating population of about 3000. In 1837 it amounted to 29,984, of whom 13,749 were Chinese settlers, and 9132 Malays, the Europeans being but few in number; and at present (1853) the population exceeds 50,000, of whom about half are Chineso.

The principal merchants and agents are Englishmen, of whom also there are a few shop-keepers, auctioneers, etc. There are also some respectable Chinese merchants; and the bulk of the shop-keepers, with the most valuable part of the laboring population, consist of Chinese. About 5000 adult males arrive annually from China by the junks, about 1000 of whom remain at Singapore, the rest dispersing themselves among the neighboring Dutch, English, and Malay settlements. The boatmen are chiefly natives of the Coromandel coast; and the Malays employ themselves as fishermen, in cutting timber, and in supplying the settlement with the rude produce of the neighborhood. There are good daily markets, open at all hours, and well supplied with vegetables, fruits, grain, fish, pork, and green turtle—the latter the cheapest animal food that can be procured. There are no export or import duties, nor anchorage, harbor, light-house dues, or any fees; but a register is kept of all exports and imports. Reports must be made to the master attendant by the masters of vessels, and invoices delivered to the superintendent of imports and exports. Though there are neither duties on imports or exports, nor on the ships frequenting the port, the revenue of Singapore amounted in 1842-'43 to 509,000 rupees, while its expenditure, civil and military, amounted to only 494,029 rupees.

United States Consular Returns from Singapore, Jan. 1, 1855.—The commercial intercourse of the United States with this consular district is governed partly by general acts of the Parliament of Great Britain, and partly by special legislation of the East India Company, through the governor and council at Calcutta. The present port regulations are supposed to be fixed, being for an indefinite period. Singapore is a free port, and the privileges permitted to commerce, as well as the restrictions imposed on it, are applicable, without distinction of flag, to all nations alike. There are no other port charges than the Pedra Branca or Straits light dues, which are three cents per registered ton on merchant vessels. National vessels of all countries are exempt from this tax. The transhipment of goods to any other port in the East India Company's possession, or to any foreign port, is freely permitted to vessels of the United States, but without any special privileges or restrictions. The moneys, weights, and measures known and in common use at Singapore, are neither those of the mother country nor those made use of in the continental possessions of the East India Company. Merchants keep their accounts in Spanish dollars, divided into one hundred parts, called cents, precisely as in our federal currency. Fractional parts of this cent are also coined, and are much in use; these are the half cent and the quarter cent, the latter being called a *pie*, or *pice*. The post-office, however, and all other offices of the British East Indian government, keep accounts only in *rupees*, *annas*, and *pice*.

Moneys.—4 pice make 1 cent; 2½ cents make 1 anna; 16 annas make 1 company's rupee (marked *R*); 100,900 rupees make 1 lac; 100 lacs make 1 crore. The company's rupee, which is here meant, is valued at 45 cents at Calcutta, while here it is now current at only 42 cents. Besides this coin, there is the old Sicca rupee (now nearly obsolete), worth here 45 cents, and the Java rupee, which is just now fluctuating at 35 to 36 cents.

Weights.—Measures of capacity are rarely used, and then only with certain articles, such as tobacco; even oils and other fluids being sold by weight. The denominations of the weights used in Singapore are taken both from the Malays and the Chinese. In naming and reducing them to the United standard value, I omit all those which are not employed commercially with and by foreign residents:

16 taels make 1 catty. (The catty is 1 lb. 5 oz. 5½ grs. avoirdupois, or 1⅓ lb.)
100 catties make 1 Chinese picul marked (Pl. or Pls.)=133⅓ lbs. avoirdupois.
2 Malay piculs make 1 char.
40 Chinese piculs make 1 koyan (or coyan).

The Malay catty weighs $24 Spanish, and the Chinese catty weighs $22½ Spanish; hence 15 catties Malay=16 catties Chinese. By the Malay, or greater picul, merchants purchase pepper, tin, etc., from the native vessels, but sell by the Chinese or Bazar picul of 133⅓ lbs. avoirdupois. Rice is sold by the koyan of 40 pls.; salt by the same measure, but weighs about 52 piculs; gold and silver thread by a particular catty of $36 weight; gold dust by the bunkal, which weighs $2=832 grs. Troy; Java tobacco is sold by the corge of 40 baskets; India piece goods by the corge of 20 pieces; wheat and grain by the bag, containing 2 Bengal maunds (the maund is 61⅓ catties).

Freight.—The rates at which ships are freighted or chartered depend on the demand for tonnage and the supply; on the kind of cargo to be transported, and on the sailing qualities of the vessels. These vary so greatly that it is impossible to give them even approximately. At the present time, for miscellaneous Straits' produce, shippers are paying $18 @ $20 per ton of 50 feet to New York or Boston.

Commissions.—While the trading ships of all other nations pay the uniform commissions of 10 per cent. (as established by the Singapore Chamber of Commerce), which include expenses of every sort for purchasing or selling, a special exception is made for what is called the "American trade," meaning that of the United States. The established charges on this are: Commissions on sales of goods or purchase of produce, free of risk, either in sales or on advances on produce, 2½ per cent. (Both of these are guaranteed for an extra 2½ per cent., or 5 per cent. in all.) On negotiating bills of exchange, 1 per cent. Other business on the usual terms. Interest on all moneys advanced is at the rate of 12 per cent. per annum, but on disbursements on account of ships while in port, 5 per cent. Added to these expenses are boat and cooly hire and warehousing, the charges for which differ widely, being governed by circumstances.

The imports from the United States, in comparison with the exports thither, are of trifling amount. I therefore state the modes and terms of purchase, as well as those of sale. Sales of imports are effected in the usual manner by private arrangement with the buyer, and sometimes also by public auction. The terms are, cash down.

Purchase of Cargo.—This is done by private contract (never at public sales) by the house to which the master of the vessel is consigned; the said house buying the goods from either the native or from the Chinese dealers, who are what is commercially styled the "first hands."

Sinhara. The sinhara, or water-nut (Trapa ?), is a native of the Cashmere, but grows abundantly in the lakes near the capital, especially in the Wurlor lake, and yields an average return of 10,000,000 lbs. of nuts a year. They are scooped up from the bottom of the lake in small nets, and afford employment to the fishermen for several months. These nuts constitute almost the only food of at least 30,000 persons for five months in the year. When extracted from the shell, they are eaten raw, boiled, roasted, fried, or dressed in various ways, after being reduced to flour.

Sinope, a town of Asia Minor, on the south coast of the Black Sea, lat. 42° 2′ 30″ N., long. 35° 9′ 45″ E. Population uncertain, probably from 8000 to 10,000. Sinope is situated on a low narrow isthmus, connecting the high rocky promontory of Ada with the main land. Its port, which is the best on this coast, on the south side of the town, is protected from the north and northeast gales by the isthmus and promontory already mentioned. Ships anchor within a third of a mile of the town, in from 13 to 17 fathoms; or nearer to it, in from 5 to 7 fathoms. There is a roadstead on the north side of the isthmus, but it is open and exposed. Sinope is one of the principal stations of the Turkish fleet; and there are docks and arsenals for its accommodation and outfit. Its exports are inconsiderable, the principal being timber, salt, cordage, fish oil, etc. In ancient times Sinope was a city of great wealth, magnitude, and importance. It was the birthplace of Diogenes the Cynic; and Mithridates made it the capital of his dominions. After its conquest by the Romans under Lucullus, it became the seat of a colony, and continued for a lengthened period to enjoy a good deal of consideration. Should civilization and the arts once more revive in the ancient Pontus, and the other countries to the south of the Black Sea, the excellence of its port could not fail to restore to Sinope some portion of its former grandeur. Even now a considerable intercourse is beginning to take place with the countries east and south of Sinope. Diarbeker on the Tigris, in lat. 37° 54′ N., long. 39° 53′ 45″ E., is one of the principal seats of Eastern commerce; and caravans set out regularly from it for Aleppo, Smyrna, and Constantinople: but any one who consults a map of Asia Minor, and of the contiguous countries, will see at once that Trebizond and the neighboring ports on the southeast coast of the Black Sea are the natural channels through which Armenia, Koordistan, and the northwestern parts of Persia may best maintain an intercourse with Europe. For further particulars as to Sinope, *see* TOURNEFORT, *Voyage du Levant*, and NORIE'S *Sailing Directions for the Black Sea.*

Skins. The term is applied in commercial language to the skins of those animals—as deer, goats, kids, lambs, etc.—which, when prepared, are used in the lighter works of book-binding, the manufacture of gloves, parchment, etc.; while the term hides is applied to the skins of the ox, horse, etc., which, when tanned, are used in the manufacture of shoes, harness, and other heavy and strong articles. Lamb and kid skins are principally used in the glove manufacture; 120 skins being supposed to produce, at an average, 18 dozen pairs of gloves.—*See* HIDES and LEATHER.

Slate (Roof) (Ger. *Schiefer*; Fr. *Ardoise*; It. *Lavagna, Lastra*; Sp. *Pizarra*), a fossil or compact stone (*argillaceous schistus*) that may be readily split into even, smooth, thin laminæ. There are several varieties of this valuable mineral, the prevailing colors being gray, blue, and brown. But the tints are very various; and slates are often marked with streaks of a different color from the ground. Slate is principally used in the covering of houses, for which purpose it is infinitely superior to thatch or tiles, and is far less expensive than lead. Good roofing slate should not absorb water; and it should be so compact as not to be decomposed by the action of the atmosphere. When properly selected, roof slates are of almost perpetual duration; but those which are spongy and imbibe moisture speedily get covered with moss, and require, at no very distant period, to be renewed.

Slaves and Slave-trade. A slave, in the ordinary sense of the term, is an individual at the absolute disposal of another, who has a right to employ and treat him as he pleases. But the state of slavery is susceptible of innumerable modifications; and it has been usual, in most countries where it has been long established, to limit in various ways the power of the master over the slave. The *slave-trade* is, of course, the business of those who deal in slaves. A great deal of learning has been employed in tracing the history of slavery, though the subject is still far from exhausted. It seems most probable that it originally grew out of a state of war. In rude, uncivilized communities, where the passion of revenge acquires a strength unknown in more advanced states of society, captives taken in war are adjudged to belong to the victors, who may either put them to the sword or reduce them to a state of servitude. In antiquity the ideas of war and slavery were inseparable. Probably in very remote ages prisoners were most commonly put to death; but the selfish gradually predominated over the more passionate feelings, and for many ages it was usual to reduce them

to the condition of slaves; being either sold by their captors to others, or employed by them as they might think fit. The practice of reducing men to a state of slavery, having once begun, was extended in various ways. The progeny of slaves or of women in a state of slavery were slaves; men born free might sell themselves as slaves; and parents had authority, in Judæa and Rome, to dispose of their children for the same purpose.—MICHAELIS *on the Laws of Moses*, ii. 163, Engl. ed. It was the law of Rome, and of most other ancient states, that the persons of debtors who had contracted obligations which they could not discharge should become the property of their creditors. "*Serri*," says Justinian, "*autem aut nascuntur aut fiunt: nascuntur ex ancillis nostris, fiunt aut jure gentium, id est ex captivitate; aut jure civili, cum liber homo major viginti annos ad pretium participandum sese venundari passus est.*" —*Instit.*, lib. i. tit. 3.

The African slave-trade was commenced by the Portuguese in 1442. It was, however, but of trifling extent till the commencement of the 16th century. In consequence, however, of the rapid destruction of the Indians employed in the mines of St. Domingo or Hayti, Charles V. authorized, in 1517, the introduction into the island of African slaves from the establishments of the Portuguese on the coast of Guinea. The concurrence of the emperor was obtained by the intercession of the celebrated Las Casas, bishop of Chiapa, who labored to protect the Indians by enslaving the Africans; though, as the latter were certainly more vigorous and capable of bearing fatigue than the former, the measure was not in reality so contradictory as it would at first sight appear to be.—ROBERTSON'S *Hist. America*. The importation of negroes into the West Indies and America, having once begun, gradually increased, until the traffic became of great extent and importance. Sir John Hawkins was the first Englishman who engaged in it; and such was the ardor with which our countrymen followed his example, that they exported from Africa more than 300,000 slaves between the years 1680 and 1700; and between 1700 and 1786, 610,000 Africans were imported into Jamaica only; to which adding the imports into the other islands and the continental colonies, and those who died on their passage, the number carried from Africa will appear immense.—BRYAN EDWARDS, *Hist. West Indies*. The importations by other nations, particularly the French and Portuguese, were also very great. We may, however, shortly observe that there can be no doubt that slavery has always existed in Africa; and it is sufficiently well known that previously to the commencement of the traffic such of the captives taken in war as could not be advantageously employed as slaves were most commonly put to death—cannibalism, the exposure of infants, and human sacrifices being then also very frequent. The slave-trade, by opening a ready and profitable market for slaves, assisted in putting an end to these enormities, though it be, at the same time, true that the desire of profiting by their sale has tempted the petty princes to make war on each other for the chance of making captives, and has given a stimulus to man-stealing and other atrocities.—*Geog. Dict.*, art. AFRICA. But those who inquire dispassionately into the subject will probably come to the conclusion that, instead of being injured, the slaves have gained by being carried from the Old to the New World. Speaking generally, the negroes are in the lowest state of abasement, possessing merely the rudiments of the most indispensable arts, a prey to the vilest superstition and tyranny, without any tincture of learning, and with little or no regard for the future. The circumstances under which they are placed in their native land may, perhaps, account for the low state in which we find them; but, however explained, the genuine negroes of Africa are admitted, even by those least inclined to depreciate them, to be for the most part "either ferocious savages, or stupid, sensual, and indolent."—PRICHARD, *History of Man*, ii. 338, 3d ed.

Abolition of Slavery.—The year 1833 was memorable for the abolition of slavery throughout the British colonies. In enacting this celebrated statute, Parliament endeavored to reconcile the apparently conflicting claims of humanity and justice, by providing for the emancipation of the slaves without prejudice to the just rights and claims of their proprietors. This was effected by assigning to the latter the sum of *twenty millions* sterling, which was distributed among them on their complying with the provisions of the act. This is, perhaps, the greatest pecuniary sacrifice ever voluntarily made by any nation in vindication of the right of property. But it was not too great for the object in view; for had that right been violated in this instance, a precedent would have been set for its violation in others, and the consequences would have been most disastrous. The measure, in fact, reflects quite as much credit on the wisdom and honesty as on the generosity of the British nation. This celebrated statute enacted that slavery should cease in all British colonial possessions on the 1st of August, 1834; when the slaves were to become apprenticed laborers, their final and complete emancipation taking place partly on the 1st of August, 1838, and partly on the 1st of August, 1840. But a clamor having been raised against the duration of the apprenticeship, its period was shortened, and the blacks became universally free in 1838.

Distribution of Slave Compensation.—The commissioners for the apportionment of the £20,000,000 granted by Parliament as compensation to slave owners, under the act 3 and 4 Will. IV., cap. 73, issued the following table, showing the average value of a slave in each colony; the number of slaves in each; the total value of the slaves, supposing the annual value of each were realized; and the proportion of the £20,000,000 received by each colony.

Colony.	Average Value of a Slave from 1822 to 1830.	Number of Slaves by the last Registration.	Relative Value of the Slaves.	Proportion of the £20,000,000 to which each Colony is entitled.
	£ s d		£	£
Bermuda	27 4 11½	4,203	114,527	50,584
Bahamas	20 18 9½	9,705	200,573	128,340

Total	.....	780,993	45,281,738	20,000,000

Dr. Livingstone, who is acknowledged as being conversant upon subjects affecting the slave-trade, says: "I have thus ventured to state my conviction in favor of our present system, formed as it was from personal observation, and in the teeth of a strong bias to the contrary, that you may, according to your custom, and if you should deem it advisable, give this to your readers by way of helping them to both sides of the question. It is not to be supposed for a moment that the present system of coercion will result in a radical cure of the evil. *The cultivation by the Africans on their own soil of the raw materials of our manufactures, and the influence of Christian civilization alone will effect a permanent suppression of the slave-trade.* But all hope of this must be given up if the coast tribes are to be hounded on by the Europeans to hunt down the defenseless inland inhabitants, *on the absurd pretense of promoting 'free emigration.'* It is no more true that Africans take delight in hunting, buying, and selling each other than that the English glory in hanging themselves in November. I know that this is the case throughout the interior, and I was sorry at the cause of a different state of things on the borders of civilization. But we are ignorant of the sources whence statements such as that referred to arise. From meeting it in various quarters, and more especially in the mouths of slave-holders, or would-be slave employers, I am inclined to think that both it and that about the inefficiency of Her Majesty's cruisers have had their origin in those who are, directly or indirectly, abettors of slavery, and that they are promulgated by many who, like myself, had not the means of testing their truth."

Passing over the interval from the period when the slave-trade was declared to be piracy to the year 1840, we find that the number introduced into Brazil from that year to 1851, inclusive, was 348,609, or a little more than 30,000 a year. During the same period the number imported into Cuba amounted to an average of about 6000 a year. The following tables shew the importations into Brazil and Cuba from 1851 to 1854:

	Slaves.
Imported into Brazil in the year 1851	47,000
" " " 1852	60,000
" " " 1853	3,700
Total	100,700
Imported into Cuba in 1851	5,000
" " " 1852	7,924
" " " 1853	12,500
" " " 1854	10,230
	35,654
	100,700
Total	136,354

For the four years from 1851 to 1854, inclusive, this gives an average importation into both countries of something over 34,000 a year. As perhaps not more than three-fourths of the whole number was reported to the mixed commission, the yearly average for this period may be set down at 45,000. From the year 1854 there were very few, if any, slaves imported into Brazil, in consequence of the laws passed by the government of that country against the traffic. The slave-trade is now mainly, if not wholly, carried on with Cuba, which imports about 20,000 slaves every year; which, added to the total of the trade with both Brazil and Cuba since the year 1850, gives the average number imported every year, up to the present time, at about 30,000. If the profit realized on the purchase of one slave amounts, as we have shewn in the following tables, to $365, the total profits of one year's trade will therefore be about $11,000,000.

As a curious exhibit, we give the statistics showing the estimated part which this country takes in this nefarious traffic. It is estimated that in the port of New York alone about twelve vessels are fitted out every year for the slave-trade, and that Boston and Baltimore furnish each about the same number, making a fleet of thirty-six vessels all engaged in a commerce at which the best feelings of our nature revolt. If to these be added the slavers fitted out in other Eastern ports besides Boston, we will have a total of about forty, which is rather under than over the actual number. Each slaver registers from 150 to 250 tons, and costs, when ready for sea, with provisions, slave equipments, and every thing necessary for a successful trip, about $8000. Here, to start with, we have a capital of $320,000, the greater part of which is contributed by Northern men. The expenses of fitting out, and of the trip to and from the coast of Africa, may be estimated as follows:

Cost of forty slavers ready for sea	$320,000
Expenses at the port for brokerage and commission, $3000 on each vessel	120,000
Captains' and seamen's wages for the voyage	100,000
Amount paid for negroes on the coast of Africa, at $15 a head, allowing 600 to each vessel	36,000
Port charges and secret money paid at the place of landing in Cuba or other destination, $42 for each negro, allowing a diminution of 100 in each vessel by death on the passage	840,000
Total	$1,456,000

From this estimate it will be seen that the amount of capital required to fit out a fleet of slavers is about $1,500,000, upon which the profits are so immense as almost to surpass belief. In a single voyage of this fleet 24,000 human beings are carried off from different points on the slave coast; and of these 4000, or one sixth of the whole number, become victims to the horrors of the middle passage, leaving 20,000 fit for market. For each of these the trader obtains an average of $500, making a total for the whole 20,000 of $10,000,000. Now, if we estimate the number of trips made by each vessel in a year at two, we will have this increased to $20,000,000. Each vessel, it is true, can make three, and sometimes four trips, but as some of them are destroyed after the first voyage, we have placed the number at the lowest estimate. The expenses and profits of the slave-trade for a single year compare as follows:

Total expenses of two voyages	$3,000,000
Total receipts of ditto	20,000,000
Profits	$17,000,000

The laws of Congress on the subject of the slave-trade were passed March 22, 1794; May 10, 1800; February 28, 1803; March 2, 1807; April 20, 1818; March 3, 1819; May 15, 1820; March 3, 1843; September 20, 1850. Conventions on the subject of the slave-trade were held July 12, 1822; November 13, 1826, with Brazil; March 2, 1827; August 9, 1842. By the act of March 22, 1794, the slave-trade was prohibited. The act of May 10, 1800, applied to foreigners residing in the United States, and forbid citizens from being engaged in foreign ships in the slave-trade. By the act of March 2, 1807, vessels with slaves on board were to be forfeited, the naval forces to be employed to enforce the act. By the act of April 20, 1818, the importation of negroes, or persons of color, "to be held to service or labor," was prohibited. By the act of March 3, 1819, the naval ships would send to the United States, for confiscation, any ships detected in the slave-trade; a bounty was offered of $25 for each negro captured and delivered to the United States Marshal. By the act of May 15, 1820, the slave-trade was declared to be piracy, and any citizen detected in the trade should suffer death. By the act of September 20, 1850, the slave-trade in the District of Columbia was prohibited; no slave to be brought into the District for sale as merchandise; and all slave depôts to be broken up.

For discussions on slavery and slave-trade, see *For. Quart.*, xxxiv. 104; *South. Quart.*, xix. 101, xxi. 209; *Living Age*, xiv. 235, xvi. 509; *Edinb. Rev.*, xli. 170, lxxlii. 347 (Peabody); De Bow's *Rev.*, x. 658, xi. 23–184, viii. 122, ix.; *South. Lit. Mess.*, ix. 736, vii. 774.

Coolie Trade.—This trade has sprung up since vigorous efforts have been made to suppress the slave-trade proper. Although theoretically the coolie trade prom-

lsed benefits to both planters and coolie, yet practically it is only another form of the slave-trade.

The truth uttered by a late number of the *California Chronicle* in the following paragraph is but too true:

"We hear of these wretched beings dying on their passage from Canton to Callao of hunger, thirst, and foul disease engendered by close confinement, without air or nutriment, in the holds of ships; we hear of these unfortunates murdering one another in the agony of their suffering; and yet, although the thing is plain and palpable before our very eyes, the civilized, the Christian world shrugs its shoulders, exclaims 'horrible,' and leaves the helpless creatures to their fate."

In extenuation of the guilt incurred, it is alleged that the parties concerned have a contract with the coolies; but in effect the deluded victim is a slave, and not the faintest dawn of hope illumines his dark horizon. Numerous important and incontrovertible facts have been brought to the attention of our government by means of the "message from the President of the United States, communicating information in regard to the slave and coolie trade," presented to the House of Representatives one year ago.

Mr. Parker, United States Minister to China, wrote to Mr. Marcy on the 12th of February, 1856, that the following shipments of coolies had been made during the year 1855 from Swatow, an illegal port even for legal trade:

	Ships	Tonnage.	Coolies.
American	5	6,592	3050
British	3	3,821	1938
Chilian	1	500	250
Peruvian	3	1,860	1150
Total	12	12,773	6388

Mr. Parker also stated, from official information, that the number of males imported as coolies from Calcutta and Madras, from 1845 to 1852, into British Guiana and Trinidad, was 1700; and he suggested "the necessity of specific instructions emanating from the Navy Department to our men-of-war on the China station, authorizing them to resort to illegal ports, and to examine such vessels as do, and ascertain that they do not offend against law, and to make them accountable if they do." January, 1856, Mr. C. D. Mugford, at Hong Kong, notified Mr. Parker that he was agent for one of the most respectable firms in the United States, who had made a contract with the Brazilian government for sending to Rio de Janeiro some 2000 Chinese, and that part of them had been shipped, but the firm referred to were ready to abide by the decision of the governments of the United States or China as regards the legality of the trade. Subsequently, Mr. Parker addressed a public notification calling on citizens of the United States to desist from this irregular and immoral traffic.

The evidence constantly accumulating to show the horrible character of this trade calls still more loudly for its speedy suppression. The *London Times* recently published a deeply interesting communication on this subject, from which we extract the following:

"The testimony of Sir John Bowring to the lamentable condition of the Chinese emigrant can not but recall to most of our readers' minds the disclosures made a few weeks ago at the Thames Police Court in London with respect to the condition of the coolies on board the ship *Duke of Portland*, on her voyage from Hong Kong to Havana. It will be remembered that on the occasion referred to the master of the vessel made the confession that one hundred and thirty-two of the emigrants, all of whom had been taken on board, he said, in good health, had died between Hong Kong and Havana. He had 'had as many as two hundred invalids at one time,' and 'many more had died after they had landed in Cuba.' His log-book contained daily, and more than daily, entries of death. The magistrate said 'he had heard of the horrors of the middle passage when the odious slave-trade was in existence, but he never heard of any thing like this.' The counsel said, 'It is most horrible. Chinamen are brought from China to work on plantations, and this is the result. The English flag is disgraced by such a traffic.' The captain confessed, 'It is a dreadful traffic, and quite time it was put an end to.' Yet this was but an accidental disclosure of a system which was only casually brought to light in this instance by the magistrate's inspection of the log-book in a suit of wages.

"I have myself, when in Havana, heard accounts and witnessed scenes connected with this traffic which are perfectly appalling. In some instances the proportion of dead to living at the conclusion of the voyage has been as high as two hundred of the one for every three hundred of the other. In March, 1853, the British ship *Gertrude* arrived at Havana with a cargo of 198 Chinamen, and in a note appended to the return we read, 'of the *Gertrude's* 152 died.'

"Such are the horrors of this second slave-trade during the passage. When he arrives at his destination, in the majority of instances, the coolie finds that his misery has but commenced. I have seen examples of considerate treatment, and consequently of comparative comfort; but these are unhappily rare. On arriving at Havana, after passing the quarantine, the coolie, if he survive, is transferred to the highest bidder, who places him upon his plantation side by side with his slaves. His term of service is eight years; his labor as hard as his master thinks he can sustain. He receives a small payment monthly, which makes his condition by a few dollars preferable to that of the slave. He is exposed to the same toil, watched by the same overseer, with whip in hand and sword at his side, as the slave.

"On the other hand, his position is worse than that of his slave companion, inasmuch as his master's interest in him terminates after eight years. In proportion as the term of service approaches its expiration, the motive for retaining the coolie in life decreases. The slave's life is usually worked out, as the Cuban planters have themselves confessed to me, in ten years of full work. The Chinese coolie, as every one who has lived on the Cuban plantations knows, reaches his end on an average after a very much shorter term of labor. Again, the Chinaman does not bear the tropical heat with the ease with which the negro endures it."

Sloop, a vessel of one mast, the mainsail of which is attached to a gaff above, to a boom below, and to the mast on its foremost edge; different from a *cutter* by having a fixed bowsprit and a jib-stay. It is also a general name for ships of war below the size of frigates.

Smack, a vessel with one mast, commonly rigged as a sloop, and used in the coasting trade, or as a tender in the royal navy. The vessels of this name that have long plied between Leith and London are well known, and have always been noted for their security.

Smaltz, or **Smalt** (Ger. *Schmalz*; Du. *Smalt*; Fr. *Smalt*; It. *Smalto azzurro, Smaltino*; Sp. *Esmalte, Azul azur*; Russ. *Lasor*), an oxyd of cobalt, melted with siliceous earth and potash. It is a sort of glass, of a beautiful deep blue color; and being ground very fine, is known by the name of powder blue. The color of smaltz is not affected by fire; and it is consequently in great demand in the painting of earthen-ware. It is also employed in the coloring of paper, and for other purposes in the arts. Beckmann has proved that the process used in the preparation of smaltz was invented about the end of the 15th or the beginning of the 16th century; and that the blue glass of the ancients owes its color, not to the presence of cobalt or smaltz, but to that of iron.—*Hist. of Inventions*, vol. ii., art. COBALT.

Smuggling, the offense of importing prohibited articles, or of defrauding the revenue by the introduction of articles into consumption, without paying the duties chargeable upon them. It may be committed indifferently either upon the excise or customs revenue.

This crime, which occupies so prominent a place in the criminal legislation of all modern states, is wholly the result of vicious commercial and financial legislation. It is the fruit either of prohibitions of importation, or of oppressively high duties. It does not originate in any depravity inherent in man, but in the folly and ignorance of legislators. A prohibition against importing a commodity does not take away the taste for it; and the imposition of a high duty on any article occasions a universal desire to escape or evade its payment. Hence the rise and occupation of the smuggler. The risk of being detected in the clandestine introduction of commodities under any system of fiscal regulations may always be valued at a certain average rate; and wherever the duties exceed this rate, smuggling immediately takes place. Now there are plainly but two ways of checking this practice—either the temptation to smuggle must be diminished by lowering the duties, or the difficulties in the way of smuggling must be increased. The first is obviously the more natural and efficient method of effecting the object in view; but the second has been most generally resorted to, even in cases where the duties were quite excessive. Governments have uniformly almost consulted the persons employed in the collection of the revenue with respect to the best mode of rendering taxes effectual; though it is clear that the interests, prejudices, and peculiar habits of such persons utterly disqualify them from forming a sound opinion on such a subject. They can not recommend a reduction of duties as a means of repressing smuggling and increasing revenue, without acknowledging their own incapacity to detect and defeat illicit practices; and the result has been that, instead of ascribing the prevalence of smuggling to its true causes, the officers of customs and excise have almost universally ascribed it to some defect in the laws, or in the mode of administering them, and have proposed repressing it by new regulations, and by increasing the number and severity of the penalties affecting the smuggler. As might have been expected, these attempts have, in the great majority of cases, proved signally unsuccessful. And it has been invariably found that no vigilance on the part of the revenue officers, and no severity of punishment, can prevent the smuggling of such commodities as are either prohibited or loaded with oppressive duties. The smuggler is generally a popular character; and whatever the law may declare on the subject, it is ludicrous to expect that the bulk of society should ever be brought to think that those who furnish them with cheap brandy, geneva, tobacco, etc., are guilty of any very heinous offense.

"To pretend," says Dr. Smith, "to have any scruple about buying smuggled goods, though a manifest encouragement to the violation of the revenue laws, and to the perjury which almost always attends it, would in most countries be regarded as one of those pedantic pieces of hypocrisy which, instead of gaining credit with any body, seem only to expose the person who affects to practice them to the suspicion of being a greater knave than most of his neighbors. By this indulgence of the public, the smuggler is often encouraged to continue a trade which he is thus taught to consider as, in some measure, innocent; and when the severity of the revenue laws is ready to fall upon him, he is frequently disposed to defend with violence what he has been accustomed to regard as his just property; and from being at first rather imprudent than criminal, he at last too often becomes one of the most determined violators of the laws of society."—*Wealth of Nations*, p. 406. To create by means of high duties an overwhelming temptation to indulge in crime, and then to punish men for indulging in it, is a proceeding completely subversive of every principle of justice. It revolts the natural feelings of the people, and teaches them to feel an interest in the worst characters—for such smugglers generally are—to espouse their cause and avenge their wrongs. A punishment which is not proportioned to the offense, and which does not carry the sanction of public opinion along with it, can never be productive of any good effect. The true way to put down smuggling is to render it unprofitable—to diminish the temptation to engage in it; and this is not to be done by surrounding the coasts with cordons of troops, by the multiplication of oaths and penalties, and making the country the theatre of ferocious and bloody contests in the field, and of perjury and chicanery in the courts of law; but by repealing prohibitions, and reducing duties, so that their collection may be enforced with a moderate degree of vigilance; and that the forfeiture of the article may be a sufficient penalty upon the smuggler. It is in this, and in this only, that we must seek for an effectual check to illicit trafficking. Whenever the profits of the fair trader become nearly equal to those of the smuggler, the latter is forced to abandon his hazardous profession. But so long as prohibitions or oppressively high duties are kept up, or, which is, in fact, the same thing, so long as *high bounties* are held out to encourage the adventurous, the needy, and the profligate, to enter on this career, we may be assured that armies of customs officers, backed by the utmost severity of the revenue laws, will be insufficient to hinder them.

The penalty for smuggling in this country is fixed by the act of Congress, August 30, 1842, as follows: That if any person shall knowingly and willfully, with intent to defraud the revenue of the United States, smuggle or clandestinely introduce into the United States any goods, wares, or merchandise, subject to duty by law, and which should have been invoiced, without paying or accounting for the duty, or shall make out, or pass, or attempt to pass through the custom-house, any false, forged, or fraudulent invoice, every such person, his, her, or their aiders and abettors, shall be deemed guilty of a misdemeanor, and, on conviction, shall be fined in any sum not exceeding five thousand dollars, or imprisonment for any term not exceeding two years, or both, at the discretion of the court.

Smyrna, a large city and sea-port of Asiatic Turkey, on the western side of Asia Minor, lat. 33° 25′ 36″ N., long. 27° 6′ 45″ E. Population probably about 120,000, of whom 60,000 may be Turks, 40,000 Greeks, and the remainder Armenians, Franks, Jews, etc. Smyrna is situated at the bottom of a deep gulf, the entrance to which lies between the island of Mytilene on the north, and Cape Carabourun, in lat. 38° 41′ 30″ N., long. 26° 21′ E., on the south. The passage between James's Castle on the south and the opposite sand-bank is narrow; but there is from nine to ten fathoms water, with a blue clay bottom. Merchant ships anchor abreast of the city in from seven to eight fathoms; but the water is so deep that they may come close to the quays. The *inbat*, or sea-breeze, blows from morning till evening, and is always waited for by ships going up to the city. There is excellent anchorage in most parts of the gulf, merely avoiding the shoals on the north side. Smyrna is a place of great antiquity. The excellence of its port, and its admirable situation, have made it be several times rebuilt, after being destroyed by earthquakes. On approaching it from the sea, it has the appearance of an amphitheatre: the castle is at the back of the town, which it commands, on the top of the hill; but it is in a state of decay, and could oppose no resistance to an invading force. The interior of the city does not correspond to its external appearance; the streets being for the most part narrow, dirty, and ill paved. Owing to the want of cleanliness, and of all sorts of precautions on the part of the Turks, Smyrna is frequently visited by the plague. In 1814, from 50,000 to 60,000 of the inhabitants are said to have been cut off by this dreadful scourge. The trade of this city is more extensive than that of any other in the Turkish empire. The

caravans from Persia are chiefly composed of Armenians. They arrive and depart at fixed periods, which are nearly identical with those of the arrival and departure of most of the foreign ships frequenting the port. Bargains are principally effected by Jew brokers, many of whom have amassed considerable fortunes. The principal articles of import consist of grain, furs, iron, butter, etc., from Odessa and Taganrog; and of cotton stuffs and twist, silk and woolen goods, coffee, sugar, cochineal, and dye-woods, iron, tin and tin plates, rum, brandy, paper, cheese, glass, wine, etc., from Great Britain, France, Italy, the United States, etc. The exports consist principally of madder, which is the most valuable article, dried fruits, valonia, opium, silk, wool, box-wood, emery-stone, sponge, drugs, yellow berries, olive oil Turkey carpets, galls, wax, copper, hare skins, goats' wool, etc. — For further details, *see article* TURKEY, and TOURNEFORT, *Voyage au Levant*, tome ii.; MACGILL'S *Travels in Turkey*, vol. I.

* Opium, 2121 cases. Of this 713 are large, and go to England; 1408 are small, and go direct to China *via* Egypt.

In his *Lettres sur la Turquie*, the well-informed M. Ubicini estimates the value of the imports into Smyrna in 1851 at 28,473,000 francs, and that of the exports at 36,682,000 francs. The coasting trade, as that between Smyrna, Constantinople, Syria, Alexandria, and the Levant generally, is usually denominated, is almost entirely in the hands of the Greeks, and is very extensive. Excluding Greeks, the port is annually visited by from 550 to 600 foreign ships. Ubicini reckons the value of the imports of English and Swiss cottons at above 14,000,000 francs; the other leading articles of imports are English and German woolens, French silks, and colonial products.

The weights and measures are the same in this city as at Constantinople, with an exception of a small difference on some of the weights. The principal weight in Smyrna is the oke, which is of two different weights. The oke used in retail is of 400 drams, and in wholesale of 380. The wholesale oke being also known as oke of 400 drams, in order to draw a distinction between the two, we will call the first, the oke of 400 drams, "real weight," and the other, the oke of 400 drams, "nominal weight." The only oke known in Constantinople is that of 400 drams, "real weight." At Smyrna, 400 drams, "nominal weight," are = 1 oke; 45 okes = 100 rotoli = 1 kintal or kantar.

At Constantinople, 400 drams, "real weight," are = 1 oke; 44 okes = 100 rotoli = 1 kintal or kantar.

Thus, 100 kintals of iron bought at Constantinople will render here $102\frac{65}{100}$ kintals, if weighed by two accurate steelyards in both places; but as they are generally very imperfectly made, the difference varies from 1 to 1½ per cent. Generally, however, 100 kintals of Constantinople render here from 102½ to 104½.

General Remarks.—Exports are generally sold for cash, and payment is made on the first Saturday following the day of sale. It sometimes occurs, however, that one half of the money is paid the first, and the other half the succeeding Saturday; but for this purpose a special agreement is generally necessary before concluding the purchase. The term of payment is seldom extended to a third Saturday. The internal duty is always paid by the seller, and is included in the prices of commodities. The exporter has no other tax to pay than the export duty. Box-wood, canary seed, hemp seed, and terra umbra, are generally sold free on board, which comprises export duty, porterage, and shipping charges. Weighing, measuring, and all other charges, are paid by the exporter. The insurance is almost exclusively effected in the United States for goods to the States. The freight for figs, raisins, gums, nut-galls, yellow berries, and valonia, is made payable in pounds sterling (£4 $\frac{84}{100}$ per pound sterling). Some houses charge a half per cent. for storage, some one per cent., and others charge no storage at all; but when they do, they actually pay for one.

Unwashed Wool.—Besides all the charges on unwashed wool, a loss of weight must be added, arising from the picking and assorting, which generally varies from 3 to 5 per cent. The export duty shown in this statement is for Anatolia, Roumelia, and Constantinople wool, which are the kinds generally exported to the United States. The duty upon the wool of Syria, Tripoli (Barbary), Bagdad, and the adjoining country, is of $0·1097 per 100 pounds. 13,085 bales, washed and unwashed wool, have been exported to the United States during the period mentioned in this statement, representing an amount of $598,178. No sales of commodities took place during the months at which the price is left blank in this statement. On all such commodities where the price is left open in the column of "retail prices," little or no consumption exists.

Leeches.—Leeches are a monopoly, and two European houses of this city have the exclusive right of exporting them, or to sell them in the market.

Sponges.—The price of this article varies considerably: that of common sponges, called "chemuches," after they had been prepared for shipment, varied from $15 to $27 per 100 lbs., and that of fine sponges from $105 to $600 per 100 lbs. The former are shipped in

bales, and are the kind most exported to the United States, and the latter in cases. They are generally bought in the lump from on board the boats which bring them from the neighboring islands by the exporters, who wash them, throw off the sand, and otherwise prepare them for shipment; consequently their price per weight depends on the quantity of sand, stones, etc., they may contain, and can only be ascertained after this operation has been gone through. The purchase of this article requires considerable skill, and oftentimes the most experienced dealers are much deceived, so much so that a difference in price of 20 to 25 per cent., more or less, is regarded as a matter of no great moment. Besides the commodities noted in this statement, 2677 bales of rags and 70 tons of emery stones have also been exported to the United States; but both of these articles are a monopoly, and are only exported by two houses of Smyrna. The trade between Smyrna and the United States is generally carried on with Boston and New York, but principally with the former place.—*United States Consul at Smyrna*, November 4, 1854. For further information, see *Com. Relat. United States; Living Age*, x. 201, xxviii. 167; Hunt's *Merchants' Magazine*, xxv. 452 (F. W. Holland).

Snuff (Germ. *Schnupftaback*; Fr. *Tabac en poudre*; It. *Tabacco da naso*; Sp. *Tabaco de polvo*; Russ. *Nosovoi tabak*), a powder in very general use as an errhine. Tobacco is the usual basis of snuff; but small quantities of other articles are frequently added to it, to vary its pungency, flavor, scent, etc. Though substantially the same, the kinds and names of snuff are infinite, and are perpetually changing There are, however, three principal sorts the first, granulated; the second, an impalpable powder; and the third, the bran or coarse part remaining after sifting the second sort. Unless taken in excess, no bad consequences result from its use.—*See* Tobacco.

Snuffboxes are made of every variety of pattern, and of an endless variety of materials. We only mention them here for the purpose of giving the following details, not elsewhere to be met with, with respect to the manufacture of Laurencekirk or Ayrshire boxes. These are made of wood, admirably jointed, painted, and varnished. These beautiful boxes were first manufactured at the village of Laurencekirk, in Kincardineshire, about 60 years since. The original inventor was a cripple hardly possessed of the power of locomotion. Instead of curtains, his bed (rather a curious work-shop) was surrounded with benches and receptacles for tools, in the contrivance and use of which he discovered the utmost ingenuity. Instead of taking out a patent, the inventor confided his secret to a joiner in the same village, who in a few years amassed considerable property; while the other died, as he had lived, in the greatest poverty. The great difficulty of the manufacture lies in the formation of the hinge, which, in a genuine box, is so delicately made as hardly to be visible. Peculiar, or, as they are called, secret tools, are required in its formation; and though greatly improved by time and experience, the mystery attached to their preparation is still so studiously kept up that the workmen employed in one shop are debarred having any communication with those employed in another.

Snuff-taking. This practice took its rise in England from the captures made of vast quantities of snuff by Sir George Rooke's expedition to Vigo in 1702. The prize of the forces having been sent home and sold, the vice soon obtained from which the revenue now draws, with tobacco, considerably more than £4,000,000 per annum. In the year ending January 5, 1854, there were imported 35,000,000 lbs. of tobacco and snuff, of which 36,400,000 lbs. were entered for home consumption.—*See* Tobacco.

Soap (Ger. *Seife*; Fr. *Savon*; It. *Sapone*; Sp. *Jabon*; Russ. *Mylo*; Lat. *Sapo*). This article was imperfectly known to the ancients. The first express mention of it occurs in Pliny and Galen; and the former declares it to be an invention of the Gauls, though he prefers the German to the Gallic soap. In remote periods clothes were cleansed by being rubbed or stamped upon in water. Nausicaa and her attendants, Homer tells us, washed theirs by treading upon them with their feet in pits of water.—*Odyssey*, book vi. The manufacture of soap began in London in 1524, before which time it was supplied by Bristol at one penny per pound. —Haydn. The soap met with in commerce is generally divided into two sorts, *hard* and *soft*: the former is made of soda and tallow or oil, and the latter of potash and similar oily matters. Soap made of tallow and soda has a whitish color, and is, therefore, sometimes denominated *white* soap; but it is usual for soapmakers, in order to lower the price of the article, to mix a considerable portion of rosin with the tallow; this mixture forms the common *yellow* soap of this country. Soap made of tallow, etc., and potash does not assume a solid form; its consistence is never greater than that of hog's lard. The properties of soft soap as a detergent do not differ materially from those of hard soap, but it is not nearly so convenient to use. The alkali employed by the ancient Gauls and Germans in the formation of soap was potash: hence we see why it was described by the Romans as an unguent. The oil employed for making soft soap in this country is whale oil. A little tallow is also added, which, by a peculiar management, is dispersed through the soap in fine white spots. The soap made in countries which produce olive oil, as the south of France, Italy, and Spain, is preferable to the soap of this country, which is usually manufactured from grease, tallow, etc.—Thomson's *Chemistry*.

The use of soap as a detergent is well known; it may, in fact, be considered as a necessary of life. Its consumption in most civilized countries is immense. Pliny informs us that soap was first invented by the Gauls; that it was composed of tallow and ashes; and that the German soap was reckoned the best.—Lib. xviii.

Society Islands. These islands, lying in the Pacific Ocean, between lat. 16° and 18° S., and long. 148° and 155° W., are under the protectorate of the French government. The principal islands of the group are Tahiti, Eimeo, Hunheine, Raiatea, Bona-bona, Tahaa, an Meura. Papiete, the capital of Tahiti, is much resorted to by American and other whalers. The exports consist of oranges, pearl-shell, arrow-root, cocoanut oil, and other native products of minor commercial importance. The intercourse between the United States and these Islands has increased with our rapidly-increasing relations with Valparaiso, Callao, Panama, the Sandwich Islands, Australia, and China. In 1852 there entered the port of Tahiti 36 vessels under the United States flag, measuring in all 5668 tons. Under all other flags there entered 141 vessels, with an aggregate of 12,817 tons. There are no import duties charged at the Society Islands, except upon spirituous liquors and wines, and on fire-arms and munitions of war. On the last-named articles these duties amount to a prohibition. These islands are under a different system of commercial legislation from that which obtains in the other French colonial settlements. No distinctions are recognized as to any foreign countries, or as to any foreign or domestic ports, with respect to entering or clearing foreign vessels, with cargoes or in ballast. As regards alcoholic and other beverages, American vessels are placed on the same footing as French vessels as to duty, while those of other nations pay double import duties. This distinction is regulated by *arrêté* No. 65, of May 8, 1853. The ports open to foreign vessels are Papiete and Taunoa, at Tahiti; and Papetoai, at Meura. No foreign vessel is permitted without a special permission, or in urgent necessity, to anchor in any other ports of the islands subject to the French protectorate. Offenders are liable to a fine of from 100

to 500 francs. The coasting trade of the islands belonging to France is reserved exclusively to vessels carrying the French or protectorate flag. The penalty for violating this restriction is, for the first offense, a fine of from 1000 to 2000 francs, and, in case of repetition, double that sum. Every captain must, within twenty-four hours after his arrival, present to the director of customs his manifest, with a detailed statement of the ammunition and arms of every kind, and also of the liquors, which, being subject to import duties, can not be landed without the authorization of the director of customs. Those who infringe this regulation are liable to a fine of from 50 to 400 francs. Making a false declaration respecting prohibited goods, or those the sale of which is restricted, is punished by a fine of from 1000 to 5000 francs.

When vessels have on board prohibited goods, spirits, arms, or ammunition, intended only for their own consumption or the defense of the ship, captains must present to the director of customs a detailed declaration of such kinds of stores within twenty-four hours after their arrival. The sale of munitions of war, powder, saltpetre, projectiles, muskets, arms of any kind, is prohibited, except under special permission from the commissioner of the empire; and should any goods of this kind be attempted to be fraudulently landed, they will be confiscated, in addition to the fine imposed by the police regulations. All spirits or liquors which may be attempted to be fraudulently landed are liable to confiscation, as well as the boat conveying them; and the captain, who is held responsible for all goods which may be on board, under whatever conditions, is liable to a fine of from 5000 to 10,000 francs. All goods admitted to entry in the French establishments of Oceania may be sold on board, provided they be not sold by retail. To effect sales of this kind, however, a license of the first class must be previously obtained, payable in advance, and for a period of three months. Sales of cargoes may also be effected on shore, by opening a store for that purpose, for which a similar license must be obtained, and for the same period. Wines and liquors, however, must be sold exclusively on shore, either through the medium of a consignee, or by the captain or his agent, having first procured the necessary licenses. Captains of vessels, whenever the length of their stay permits, must give notice of their departure at the post-office forty-eight hours beforehand; and when it is desired that a vessel should remain in port less than forty-eight hours, notice to that effect must be given on the day of arrival. If any of the fines specified in the foregoing regulations should not be paid within five days, at the farthest, from the date of condemnation, or satisfactory security not be tendered, a part or the whole of the cargo will be sold, or the vessel itself be retained, to liquidate the debt.—*Com. Relat. U. S.*

Soda. *See* ALKALI.

Solder, Sodder, or **Soder,** a metallic or mineral composition used in soldering or joining together other metals. Solders are made of gold, silver, copper, tin, bismuth, and lead. In the composition there must be some of the metal that is to be soldered mixed with some higher and finer metals. Goldsmiths usually make four kinds of solder, viz.: solder of eight, where to seven parts of silver there is one of brass or copper; solder of six, where only a sixth part is copper; solder of four, and solder of three. It is the mixture of copper in the solder that makes raised plate come always cheaper than flat.

Sound Dues. Under the head of DENMARK the reader will find a full history of this interesting commercial question, and also statistics illustrating the proportional interest which every nation had in the abolishment of the sound dues. Since the article DENMARK was in type the final treaties (including that of the United States here given) necessary for the adjustment of this question have been signed. We here annex, as a supplement to this question, the treaty between the United States and Denmark, year 1857. We also give a table showing the *pro rata* division of the indemnity which each nation agrees to pay Denmark.

On the 4th January, 1856, a meeting of the Ministers of Austria, Belgium, France, Holland, Prussia, Spain, and Sweden, and a Commissioner from Russia, met at Copenhagen to consider the disputed question. On the 17th of February another meeting of the Commission took place, when the same states were represented, with the addition of a delegate from Oldenburg. At this meeting a memorandum was presented, in which Denmark offered to accept as a compensation for the abolition of the sound dues, a sum of 35,000,000 rix dollars (about £3,888,888), which is about fifteen and a half years' purchase of 2,248,579 rix dollars, the average net revenue from the dues during the nine years of peace—1842 to 1847, and 1851 to 1853. Each state interested in the commerce of the Baltic to be responsible for the sum only which is assigned to it, but the offer to be binding on Denmark, on its acceptance by all the states whose representatives have taken part in the negotiation. This proposal has been accepted, as will be seen by the following treaty between the United States and Denmark (see next page).

In the annexed table, showing the *pro rata* amounts to be paid by each nation for the abolishment of the sound dues, it will be seen that Great Britain, Russia, and Prussia pay over 68 per cent. of the total; and that the first and second pay 56 per cent. of the total. The share apportioned to the United States is only 2 per cent., while the trade of this country would appear to be about 6 per cent. of the whole.

TABLE SHOWING THE PRO RATA DIVISION OF THE INDEMNITY TO DENMARK FOR THE ABOLISHMENT OF THE SOUND DUES TO BE PAID BY EACH NATION.

As to the basis of the contribution, it would have been just to have taken the quantity of goods carried, or duties paid, by the ships of each nation through the Sound and the Belt as determining the proportions respectively to be paid to the capitalization of the dues. But this proportion has not in every case been carried out, as may be seen by comparing the foregoing table with the following, which exhibits the duties paid by every nation.

A Proclamation.—Whereas a convention between the United States of America and his Majesty the King of Denmark, for the discontinuance of the Sound dues, was concluded and signed by their respective plenipotentiaries at Washington, on the 11th day of April, 1857, which convention is as follows:

The United States of America and his Majesty the King of Denmark, being desirous to terminate amicably the differences which have arisen between them in regard to the tolls levied by Denmark on American vessels and their cargoes passing through the Sound and Belts, and commonly called the Sound dues, have resolved to conclude a convention for that purpose, and have named as their plenipotentiaries, that is to say, the President of the United States, Lewis Cass Secretary of State of the United States, and his Majesty the King of Denmark, Torben Bille, Esquire, Knight of the Dannebrog, and decorated with the Cross of Honor of the same order, his said Majesty's Chargé d'Affaires near the government of the United States, who, after having communicated to each other their full powers in due form, have agreed to and signed the following articles:

Article I. His Majesty the King of Denmark declares entire freedom of the navigation of the Sound and the Belts in favor of American vessels and their cargoes from and forever after the day when this convention shall go into effect as hereinafter provided. And it is hereby agreed that American vessels and their cargoes, after that day, shall not be subject to any charges whatever in passing the Sound or the Belts, or to any detention in the said waters; and both governments will concur, if occasion should require it, in taking measures to prevent abuse of the free flag of the United States by the shipping of other nations which shall not have secured the same freedom and exemption from charges enjoyed by that of the United States.

Article II. His Danish Majesty further engages that the passages of the Sound and Belts shall continue to be lighted and buoyed as heretofore, without any charge upon American vessels or their cargoes on passing the Sound and the Belts, and that the present establishments of Danish pilots in these waters shall continue to be maintained by Denmark. His Danish Majesty agrees to make such additions and improvements in regard to the lights, buoys, and pilot establishments in these waters as circumstances and the increasing trade of the Baltic may require. He further engages that no charge shall be made, in consequence of such additions and improvements, on American ships and their cargoes passing through the Sound and the Belts.

It is understood, however, to be optional for the masters of American vessels either to employ in the said waters Danish pilots, at reasonable rates fixed by the Danish government, or to navigate their vessels without such assistance.

Article III. In consideration of the foregoing agreements and stipulation on the part of Denmark, whereby the free and unincumbered navigation of American vessels through the Sound and the Belts is forever secured, the United States agree to pay to the government of Denmark, once for all, the sum of seven hundred and seventeen thousand eight hundred and twenty-nine rix dollars, or its equivalent, three hundred and ninety-three thousand and eleven dollars in United States currency, at London, on the day when the said convention shall go into full effect, as herein afterward provided.

Article IV. It is further agreed that any other or further privileges, rights, or advantages which may have been or may be granted by Denmark to the commerce and navigation of any other nation at the Sound and Belts, or on her coasts and in her harbors, with reference to the transit by land through Danish territory of merchandise belonging to the citizens or subjects of such nation, shall also be fully extended to, and enjoyed by, the citizens of the United States, and by their vessels and property in that quarter.

Article V. The general convention of friendship, commerce, and navigation, concluded between the United States and his Majesty the King of Denmark, on the 26th of April, 1826, and which was abrogated on the 15th of April, 1856, and the provisions contained in each and all of its articles, the 5th article alone excepted, shall, after the ratification of this present convention, again become binding upon the United States and Denmark; it being, however, understood that a year's notice shall suffice for the abrogation of the stipulations of the said convention hereby renewed.

Article VI. The present convention shall take effect as soon as the laws to carry it into operation shall be passed by the governments of the contracting parties, and the sum stipulated to be paid by the United States shall be received by or tendered to Denmark: and for the fulfillment of these purposes a period not exceeding twelve months from the signing of this convention shall be allowed.

But if, in the interval, an earlier day shall be fixed upon and carried into effect for a free navigation through the Sound and Belts in favor of any other power or powers, the same shall simultaneously be extended to the vessels of the United States and their cargoes, in anticipation of the payment of the sum stipulated in *Article III.*; it being understood, however, that in that event the government of the United States shall also pay to that of Denmark 4 per cent. interest on the said sum from the day the said immunity shall have gone into operation until the principal shall have been paid as aforesaid.

Article VII. The present convention shall be duly ratified, and the exchange of ratifications shall take place in Washington within ten months from the date hereof, or sooner if practicable.

In faith whereof the respective plenipotentiaries have signed the present convention, in duplicate, and have thereunto affixed their seals.

Done at Washington this 11th day of April, in the year of our Lord one thousand eight hundred and fifty-seven, and of the independence of the United States the eighty-first.

LEWIS CASS. [SEAL.]
TORBEN BILLE. [SEAL.]

And whereas the said convention has been duly ratified on both parts, and the respective ratifications of the same were exchanged in the city of Washington on the 12th instant by Lewis Cass, Secretary of State of the United States, and W. de Raasloff, his Danish Majesty's Chargé d'Affaires and Consul-general in the United States, on the part of their respective governments:

Now, therefore, be it known that I, James Buchanan, President of the United States of America, have caused the said convention to be made public, to the end that the same and every clause and article thereof may be observed and fulfilled with good faith by the United States and the citizens thereof.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done in the city of Washington, this 13th day of January, in the year of our Lord one thousand eight hundred and fifty-eight, and of the Independence of the United States the eighty-second.

[SEAL.]

JAMES BUCHANAN.

By the President:
LEWIS CASS, *Secretary of State.*

Sounding, the operation of trying the depth of the sea, and the nature of the bottom, by means of a plummet sunk from a ship to the bottom. There are two plummets used for this purpose, one of which is called the *hand-lead*, weighing about eight or nine pounds; and the other the *deep-sea lead*, which weighs from twenty-five to thirty pounds; and both are shaped like the frustum of a cone or pyramid. The former is used in shallow waters, and on approaching the land after a sea-voyage. Accordingly, the lines used for this purpose are called the *deep-sea lead line*, and the *hand-lead line*. The hand-lead line, which is usually twenty fathoms in length, is marked at every two or three fathoms; so that the depth of the water may be

ascertained either in the day or night. At the depth of two or three fathoms there are marks of black leather; at five fathoms there is a white rag; at seven, a red rag, at ten, black leather; at thirteen, black leather; at fifteen, a white rag; and at seventeen, a red rag.

Sounding with the hand-lead, which by seamen is called *heaving the lead*, is generally performed by a man who stands in the main chains to windward. Having the line quite ready to run out without interruption, he holds it nearly at the distance of a fathom from the plummet; and having swung the latter backward and forward three or four times, in order to acquire the greater velocity, he swings it round his head, and thence so far forward as is necessary; so that by the lead's sinking while the ship advances the line may be almost perpendicular when it reaches the bottom. The person sounding then proclaims the depth of the water, in a kind of song resembling the cries of hawkers in a city. Thus, if the mark of five fathoms is close to the surface of the water, he calls, "By the mark five;" and as there is no mark at four, six, eight, etc., he estimates those numbers, and calls, "By the dip four," etc.; if he judges it to be a quarter or a half more than any particular number, he calls, "And a quarter five," "and a half four," etc. If he conceives the depth to be three quarters more than a particular number, he calls it a quarter less than the next: thus, at four fathoms and three fourths he calls, "A quarter less five."

The deep-sea lead is marked with two knots at twenty fathoms, three at thirty, and four at forty, and so on to the end. It is also marked with a single knot in the middle of each interval.

Until the commencement of the plan of deep-sea soundings, as now conducted in the navy of the United States, the bottom of the sea was almost entirely unknown to us.

It has been proven that the system of deep-sea soundings formerly in use was not accurate. This was simply letting down a lead, until by a shock the line became slack; but it was found that the line would run on without end, being dragged out by under-currents, and that beyond a certain depth no shock was felt.

The plan of deep-sea soundings now in practice in our navy was suggested by Lieutenant Maury, and has been successful principally from the adoption of a lead invented by Lieutenant J. M. Brooke, U.S.N.

This method is to take a cannon-ball, bored through the middle, and a wire inserted; and so arranged that when it touches bottom the ball slips off, and the wire with the line is drawn up. The wire has a cap at the end, with some adhesive matter to attach particles of the bottom. The line is prepared for the purpose, so as to bear the weight, and yet of small resistance in sinking. Experiment has proven that while the plummet is sinking the line runs out at an increasing rate per minute; and by observing when the rate becomes constant, we get the depth, as a current would draw at a constant speed.

Mr. Maury gives this law of descent:

2*m.* 21*s.*	as an average time of descent from	400	to	500	faths.
3*m.* 26*s.*	"	"	"	1000 " 1100	"
4*m.* 29*s.*	"	"	"	1800 " 1900	"

Lieutenant Walsh, of the United States schooner *Fancy*, reported a cast with the deep-sea lead of thirty-four thousand feet without a bottom. His sounding-line was an iron wire more than eleven miles in length. Lieutenant Berryman, of the United States brig *Dolphin*, reported another unsuccessful attempt to fathom mid-ocean with a line thirty-nine thousand feet in length. Captain Dedham, of Her Britannic Majesty's ship *Herald*, reported bottom at the depth of forty-six thousand feet; and Lieutenant J. P. Parker, of the United States frigate *Congress*, afterward, in attempting to sound near the same place, let go his plummet, and saw a line fifty thousand feet long run after it as though the bottom had not been reached. The last three attempts were made according to the plan mentioned above. For further interesting items we refer to MAURY'S *Physical Geography of the Sea*.—See ATLANTIC OCEAN.

Soundings for the Atlantic Telegraph.—The result of these soundings has been to establish the hypothesis of Lieutenant Maury, of a submarine plateau from the Newfoundland Banks nearly to the coast of Ireland. We extract portions of the report of Lieutenant O. H. Berryman, U.S.N., to the Secretary of the Navy, giving an account of the experimental soundings made by him in the United States steamer *Arctic*, to corroborate the existence of this plateau.

"UNITED STATES STEAMER ARCTIC, *New York, October* 14, 1858

"Leaving New York on the night of July 18, I steered directly for St. Johns, where I arrived on the 29th. Taking in coal by the 31st, I sailed for Ireland, and commenced sounding as near on the Great Circle as possible, passing the north end of the 'Grand Banks' in latitude 48° 34' N., and one hundred and twenty fathoms water, although the best charts I have on board record one hundred and fifty-four. This difference I attribute to the mode of taking soundings at the time that survey was made. At intervals of thirty, forty, sixty, and one hundred miles, we sounded, all attended with complete success, but frequently involving many hours, both night and day, of great suspense and hard work, losing sometimes two or three thousand fathoms of line, sounding apparatus and all.

"The great plateau became so apparent in the middle of the ocean, and our fuel being considerably reduced, I determined to increase the intervals between the positions, to enable me to reach the coast of Ireland with enough soundings to complete a line entirely across. This was accomplished on the 22d of August, and I arrived in the harbor of Queenstown with only a few bushels of coal on board.

"Temperatures were taken hourly at the surface, and at twenty fathoms every four hours. Attempts were made to obtain them at the bottom and at different depths, but the results were so worthless, owing to some derangement of the thermometers, that I abandoned taking them, as they interfered very much with the more important object of sounding and obtaining bottom. On one occasion two were sent to the bottom in very deep water, and one indicated a temperature of twenty-one degrees, the other twenty-four degrees. On examining and comparing the rest of the thermometers, I found them all differing from each other so much, and some of the hands being broken, I was sure that they could not be used with any proper results.

"Currents were experienced to the eastward, from nine to fifteen miles in each twenty-four hours, between the Grand Banks and those of Ireland. No good opportunities for observing under-currents occurred, there being always either too much wind or a high sea. None appeared to affect our soundings very much—so little, indeed, that frequently the slack line would be coiled or kinked upon the bottom, showing plainly that it reached the bottom without the assistance of the lead—determining in my own mind that, however others may think, the cable or wire of the lightest kind will here reach the bottom most certainly.

"Only one of the sounding apparatus which was used remains, and is sent to the department for inspection, it being somewhat different, we believe, from any heretofore used—being an association of Brooke's and Massey's, with a weight or lead of my own adoption.

"The line used in sounding was that obtained from Boston, which proved indifferent, and was all expended before reaching Ireland, and we had to resort to two parts of smaller line furnished at the navy-yard. Having eighty thousand fathoms of the smaller size line on reels, we had it made up into one of about four thousand, and we found it decidedly the best that we have yet used, it being very strong and small.

"On both sides the interest taken in this great enterprise is very great, and it is with every satisfaction that I can state that the navy of the United States is particularly recognized as having promptly and efficiently executed the preliminary and important survey for so stupendous a work as laying a telegraphic cable of three thousand miles long across an ocean upward of two thousand fathoms deep, and nearly seventeen hundred miles wide."—O. H. BERRYMAN, U. S. N.

For a full statement of the results of these soundings in determining the proposed line of the cable of the Atlantic submarine telegraph, and for the statistics concerning this line, *see article* TELEGRAPH.

ABSTRACT OF DEEP SEA SOUNDINGS AND TEMPERATURES, WITH THEIR LATITUDES AND LONGITUDES, MADE ON BOARD THE UNITED STATES STEAMER "ARCTIC," LIEUTENANT COMMANDING O. H. BERRYMAN, UNITED STATES NAVY, BETWEEN NEWFOUNDLAND AND IRELAND, AUGUST, 1856.

NOTE.—The soundings in this table are placed in the order in which they appear on the profile, without regard to dates.

South America. The southern portion of the American continent extends from Point Gallenas, in lat. 12° 30′, to Cape Horn, in lat. 56° 30′. The extent of coast that it offers to the Caribbean Sea and the Atlantic is estimated at 11,000 miles; and the coast washed by the Pacific, it is stated by the latest geographical authority, has an approximate continuity of 5800 miles. At the southern extremity there is a group of mountainous islands, separated from the main land by the Straits of Magellan, and forming the Archipelago of Terra del Fuego, or "Land of Fire;" so called from the number of fires which its discoverer, Magellan, saw along its coast at night, supposed to have been volcanic. This archipelago, with its barren islands and rocks, must, however, be considered as the termination of the continent. Immediately north lies the vast and almost uninhabited country of Patagonia; while on the east, at a distance of from 300 to 400 miles in the South Atlantic, lie the Falkland group of islands.

The vast region known geographically as Patagonia extends from the River Negro, lat. 39°, to the Straits of Magellan, lat. 53° S., a distance of about 970 miles in length, with a breadth varying from 200 to 420 miles. It comprises two distinct physical regions, differing in surface and climate—the one lying on the west side of the Andes, the other on the east, and called, respectively, Eastern and Western Patagonia. The former is claimed by the Argentine Republic to the Straits of Magellan, and the latter by Chili, down to Cape Horn. Both sections are as yet, however, inhabited by aboriginal races, with the exception of a Chilian settlement at Port Famine, and on the Straits of Magellan. This division of Patagonia is comprised in the Chilian province of Chiloe, which is composed of the archipelago of that name; that of Chonos, of the most southern islands, and that part of the continent which extends from Rio Negro, and as far south as Cape Horn. On the eastern division there are several ports, among which are, Gallegos, in 51° 38′; Santa Cruz, in 50° 7′; San Julian, in 49° 12′; Desire, in 47° 5′; Nuevo Golfo, in 43°; and San Antonio, in 41° south. The few tribes of aboriginal Indians that inhabit this inhospitable region subsist upon the products of their fishery. The principal object of Chili in colonizing Port Famine, on the Straits, was to keep in check these nomadic tribes, though the colony has also been used for penal purposes. Cape Horn is uninhabited.

The South American continent has on its Pacific coast no large rivers. On the Atlantic, however, are the Amazon, the Orinoco, and the Plata, and a number of others, which, though not so large as those named, are equal in size, if not superior, to even the largest rivers in Europe. The Amazon is the largest river on the globe. Its principal tributaries vary in length from 1000 to 1800 miles, while the central stream is 4000 miles long, and is navigable 2200 miles from the sea. Peru, Bolivia, and Chili are the great mineral sites of South America, and produce chiefly silver, but also some gold and other metals, especially copper, which is very abundant in Chili. The most distinguishing feature in the vegetation of South America is the prodigious forests, which cover about two-thirds of the whole surface. Fruits of almost every variety abound, and indigo, coffee, sugar-cane, maize, and the cocoa-tree are among the chief products. The cultivation of the tea-tree has been attempted in Brazil, though it is believed without success; but *yerba matte*, from which is prepared the customary beverage of one half of the peninsula, grows in the greatest abundance in Paraguay. Spain and Portugal were severally the original colonists of South America—the former founding the states of Venezuela, New Granada, Bolivia, Peru, Chili, the Argentine Republic, Uruguay, and Paraguay; and the latter the vast empire of Brazil.

The South American states all achieved their independence between the years 1810 and 1825. These states, together with the colonies and other regions comprised in South America, with their respective areas, population, capitals, etc., are exhibited in the following table, derived from the latest geographical authority; though, as regards the strict accuracy of the figures given, the same remark applies that is made with reference to similar tables respecting Mexico and the Central American states:

States, etc.	Area in Square Miles.	Population.	Population to Square Mile.	Capitals.	Population.
New Granada	521,948	2,343,054	4·29	Bogota	45,000
Venezuela	426,712	1,149,356	2·69	Caraccas	53,800

Total	6,762,949	16,314,350	2·41		....

In the population given in the third column, no account is taken of the uncivilized Indian races, which probably number between 1,000,000 and 1,200,000 souls. These are found chiefly in the great plains of the Orinoco, Amazon, and Parana. The relative rank of the South American states, as regards their commercial intercourse with the United States, may be inferred from the subjoined comparative statement, exhibiting the values of exports to each country from the United States, and of imports from each country into the United States, during a period of four years, from 1852 to 1855, inclusive; made up from United States Treasury reports for said years:

South American States.	1854.		1855.		1856.		1857.	
	Exports.	Imports.	Exports.	Imports.	Exports.	Imports.	Exports.	Imports.
Brazil	$4,230,241	$14,110,987	$4,201,273	$15,218,935	$5,094,908	$19,262,657	$5,545,207	$21,460,738

Southampton, a parliamentary and municipal borough, sea-port town, and county of England, in the southern part of the county Hants, occupying a peninsula between the mouths of the Test and Itchin rivers, at the head of Southampton water, 12 miles south-southwest from Winchester, on the southwestern railroad, 72 miles southwest from London. Latitude of Saint Michael's spire, 50° 54′ N., long. 1° 24′ 2″ W. Population in 1851, 35,305. The new docks on the east of the town, opened in 1842, have an area of 208 acres, and have admitted steamers of more than 700 tons burden. The West India, Mediterranean, and other mails, have their station here, and the town communicates by steamers with all the ports of South England, the Channel islands, Ireland, and by railroad with London, and all the centre of England. The port extends from near Portsmouth to Christchurch. Here are some manufactures of silks and carpets, but ship-building and general commerce are the chief sources of wealth. Southampton is now the point of departure of the steamers for Alexandria (*see ante*, p. 20), and a stopping-place for the steamers between Bremen and New York.

South Carolina, one of the Southern United States, is situated between 32° 2′ and 35° 10′ N. lat., and between 78° 24′ and 83° 30′ W. long. It is 200 miles long and 125 broad, containing 28,000 square miles. The population in 1790 was 240,000; in 1800, 345,591; in 1810, 415,115; in 1820, 502,741; in 1830, 581,458; in 1840, 594,398; and in 1850, 668,507.

Early History.—When the Spaniards, under Vasquez Ayllon (1520 and 1526), arrived on the coasts of what we now call Carolina, and more especially South Carolina, they heard here of a great Indian king and country, both called *Chicora* or *Chicoria*, and they applied that Indian name for some time to this country, without, however, giving to it very distinct limits. The country was also sometimes called after its discoverer, *Tierra del Licenciado Ayllon*, or, shorter, *Tierra de Ayllon*, often also corrupted to *Terra de Aullon*. Under this name the Spaniards comprehended sometimes a very great part of North America, sometimes not more than this province.

French Claims.—It is curious enough that the French also, when they (1563) arrived at the locality of Ayllon's activity, heard again of an Indian king and country of that name. In their ears it sounded, however, like *Chicola* or *Chiouale*. After the French navigation to these regions we hear the country sometimes designated by the French themselves with the name *La Floride Françoise*, and other nations also called it *French Florida*. The Spaniards, of course, always considered it as a part of their Spanish Florida. The French built on their Riviere May (St. Mateo or St. John's River) a fort, which they called Fort Caroline or Carolina. Some map-makers and geographers applied this name, as an appellation of a country or territory, to the whole region. So we see, for instance, on a map of North America by Cornelius a Judæis (1593), the whole French Florida called *Carolina*, in honor of Charles IX., king of France. It is curious that the same name was afterward given to the same locality in honor of an English king.

English Settlements.—The English, since their settlements at Roanoke, comprehended the whole territory of Carolina under their widely-extended name of Virginia, after 1583. This grant had, however, very slight consequences. The country was not settled, not taken possession of, not even surveyed or explored. In the year 1663 Charles II. made another grant of all the lands between the 36th and 37th degrees of north latitude to Edward, earl of Clarendon, and some other lords and gentlemen, and this tract was again called, in his honor, *Carolina*; so that we may say we have three kings as godfathers to this province—Charles IX. of France, Charles I. and Charles II. of England. By a second more ample charter of the 24th of March, 1667, Charles II. extended the boundaries of Carolina from north latitude 29° to 36° 30′, and from east to west "until the Pacific Ocean." The country was divided into two great counties—a northern one, called the county of Albemarle, and a southern one, called Clarendon county.

In this same year (1667) William Sayle, the appointed Governor of Carolina, explored and surveyed the whole coast of the province, entering all the rivers and making astronomical observations. He no doubt, also, procured a map of the country to be made, but unhappily this map is not preserved for us. Probably the results of this first good survey of the coasts of Carolina were not then made known to the world at large; for we find still, on the edition of Champlain's maps of the year 1677, along the coasts of Carolina, this inscription. "*Terre non encore bien découverte continente a la Florida*" (a land not yet well discovered is connected with Florida).

In the year 1729 the whole great province was divided into North and South Carolina, and as the dividing point on the coast was fixed a small inlet to the west of Cape Fear, called Little River Inlet. In the year 1733 the province of Georgia was detached as a separate government of the old Territory of Carolina, and the southern boundaries of this latter were fixed at the mouth of the Savannah River, and within these boundaries the name of Carolina has been prescribed ever since. According to what we stated, we may in a certain degree consider the names of Wingandacoa, Weapomeoc, Ould Virginia, Albemarle county, as old particular designations for North Carolina; and the name of Chicora, Terra de Ayllon, Florida Françoise, Clarendon county, as particular appellations applied to South Carolina.—J. G. Kohl. *See* North Carolina.

Physical Features, etc.—The sea-coast is bordered with a series of islands, between which and the shore there is a very convenient navigation. The main land is

naturally divided into the lower and upper country. The low country extends from eighty to one hundred miles from the sea-coast, and is covered with extensive forests of pine, called pine barrens, interspersed with marshes and swamps of a rich soil. The banks of the large rivers and the creeks of this region are bordered with a belt of excellent land, producing cotton and Indian corn in abundance. The marshes and swamps in this district make fine rice plantations. The staple productions of the State are cotton and rice, great quantities of which are exported. Rice is extensively cultivated where the land can be irrigated by the tide or the overflowing of the rivers. The sea-island cotton produced on the islands along the shores is of a superior quality, and is in great demand. Gold, iron, granite, and marble, are the principal minerals.

There were in this State in 1850, 4,072,651 acres of land improved, and 12,145,049 acres of unimproved land in farms. Cash value of farms, $82,431,684; and the value of implements and machinery was $4,136,351. The number of live stock was—horses, 97,171; asses and mules, 37,483; milch cows, 193,244; working oxen, 20,507; other cattle, 533,935; sheep, 285,551; swine, 1,065,503; aggregate value, $15,060,015.

Agricultural Products, etc.—Wheat, 1,066,277 bushels; rye, 43,790; Indian corn, 16,271,451; buckwheat, 283; oats, 2,322,155; barley, 4583; peas, 1,026,960; potatoes, 1,76,494; sweet potatoes, 4,337,469; rice, 159,930,613 pounds; value of products of the orchard, $35,108; produce of market gardens, $47,286; pounds of butter made, 2,981,850; of cheese, 4970; sugar, 671 hogsheads; maple-sugar, 200 pounds; molasses, 15,901 gallons; beeswax and honey, 216,281 pounds; wool, pounds produced, 487,233; cotton, 300,901; flax, 333; silk cocoons, 123; hops, 26 pounds; tobacco, 74,285; hay, tons of, 20,925; clover seeds, 376 bushels; other grass seeds, 30; flax-seed, 55 bushels; wine, 5880 gallons. Value of home-made manufactures, $909,525; and of slaughtered animals, $1,302,637.

The Great Pedee River, 450 miles long, rises in North Carolina, and runs through the eastern part of the State. It is navigable for sloops 130 miles. The Santee, formed by the junction of the Wateree and the Congaree, rises in North Carolina, and has a sloop navigation for about 130 miles. The Saluda is a branch of the Congaree. The Edisto is navigable for large boats 100 miles. The Savannah washes the whole southwest border of the State, and is a noble stream. There are several smaller rivers, among which are Cooper, Ashley, and Combahee.

Manufactures, etc.—There were in the State in 1850, 13 cotton factories, with a capital invested of $778,000, employing 371 males and 572 females, producing goods valued at $742,220; 6 establishments with a capital of $185,700, employing 155 persons, and making 7286 tons of castings, etc., valued at $87,683; 287 flouring and grist mills, 448 saw-mills, 107 tanneries, 41 printing-offices, 45 newspapers—7 daily, 4 tri-weekly, 2 semi-weekly, 24 weekly, 1 bi-monthly, 5 monthly, and 1 quarterly publication. Capital invested in manufactures, $6,060,565; value of manufactured articles, $6,200,861.

In June, 1856, there were 9 railroads, with 846 miles of road finished and in operation, and 374 miles in course of construction. There were 16 banks and 2 branches, with a cash capital of $16,073,580.

FOREIGN COMMERCE OF THE STATE OF SOUTH CAROLINA FROM OCTOBER 1, 1820, TO JULY 1, 1857, SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851.

* Nine months to June 30, and the fiscal year from that time begins July 1.

Principal Ports.—Charleston, lat. 32° 47′ N., long. 79° 48′ W., situated on a point of land between the Ashley and Cooper rivers, has a spacious harbor. At the entrance to the harbor there is a sand bar, of about eight miles in length, having several channels. Three of the channels can only be used by ships of large ton-

nage; one, the ships' channel, has a depth of water of twelve feet at ebb-tide, and from seventeen to twenty at flood-tide. Ships always take a pilot, on account of shifting sands, and are moored along side wharves in safety inside the harbor. It is the chief commercial emporium of the State, and the largest shipping port on the Atlantic below Baltimore. The chief exports are cotton and rice. It is connected with the interior by the South Carolina and the Northeastern railroads. The tonnage of Charleston, in 1856, was 59,128 tons.

Beaufort, on the west side of Port Royal River, an inlet of the Atlantic, and sixteen miles from the sea, has a good harbor, but on account of a bar at its mouth only small vessels can enter it. It has little or no commerce. The tonnage in 1856 was only 110 tons.—For further particulars as to South Carolina, see *Southern Quart. Rev.*, xviii. 66, xx. 273, 298, iv. 247 (Simms); De Bow's *Rev.*, viii. 24, xi. 123; *North American Rev.*, xiii. 143.

South Sea Bubble. This destructive speculation was commenced in 1710, and the company incorporated by statute in 1716. The bubble, which ruined thousands of families, exploded in 1720, and the directors' estates, to the value of £2,014,000 sterling, were seized in 1721. Mr. Knight, the cashier, absconded with £100,000; but he compounded the fraud for £10,000, and returned to England in 1743. Almost all the wealthy persons in the kingdom had become stock-jobbers and speculators in this unfortunate scheme. The artifices of the directors had raised the shares, originally of £100, to the enormous price of £1000.—*See* Charles Mackay's *History of Modern Manias; Bankers' Magazine*, N. Y.

South Sea Duties. The British act of the 9 Ann. c. 21, establishing the South Sea Company, conveyed to them the exclusive privilege of trading to the Pacific Ocean, and along the east coast of America, from the Orinoco to Cape Horn.

Sovereign (*the Coin*). The name of an ancient as well as a modern English gold coin. In Henry I.'s reign, a coin of this denomination was issued, of the value of twenty-two shillings, and one twenty-fourth part of the weight of a pound of gold. In 34 Henry VIII., sovereigns were coined of the value of twenty shillings, which afterward (4 and 6 Edward VI.) passed for twenty-four and thirty shillings. By 56 George III., sovereigns of the new gold coinage were directed to pass for twenty shillings, and they were issued from the Mint the same year (1816), and have since maintained the same value.

Sovereignty of the Seas. The claim of England is of very ancient date. Arthur was the first who assumed the sovereignty of the seas for Britain, and Alfred afterward supported this right. The sovereignty of England over the British seas was maintained by Selden, and measures were taken by government in consequence, 8 Charles I., in 1633. The Dutch, after the death of Charles I., made some attempts to obtain it, but were roughly treated by Blake and other admirals. Russia and other powers of the North armed, to avoid search, in 1780; again in 1800.—Haydn.

Soy, a species of sauce prepared in China and Japan from a small bean, the produce of the *Dolichos soja*. It is eaten with fish and other articles. It should be chosen of a good flavor, not too salt nor too sweet, of a good thick consistence, a brown color, and clear; when shaken in a glass, it should leave a coat on the surface, of a bright yellowish brown color; if it do not, it is of an inferior kind, and should be rejected. Japan soy is deemed superior to the Chinese. It is worth, in bond, from six to seven shillings sterling a gallon. It is believed to be extensively counterfeited. —Milburn's *Orient. Com.*

Spain, or **Espana** (*Iberia, Hispania*), a untry of southwestern Europe, occupying the greater part of the Iberian peninsula, and often termed colloquially "the Peninsula," extending between lat. 36° 1′ and 43° 45′ N., and long. 3° 20′ E., and 9° 21′ W., bounded north by the Bay of Biscay and by the Pyrenees, which separate it from France, east by the Mediterranean, south by the Mediterranean and the Strait of Gibraltar, and west by Portugal and the Atlantic Ocean.

Spain is rich in minerals, especially mercury, iron, copper, and lead. The celebrated gold and silver mines of the time of the Romans have long been abandoned, but mercury is extracted in great abundance from the mines of Almaden. Lead forms an important branch of mining industry. Coal is found chiefly in the Asturias; copper, tin, zinc, antimony, arsenic, and cobalt, are common, and rock-salt is abundant in the hills of Cardona. The principal rivers of Spain are, from north to south, the Ter, Llobregat, Ebro, Guadalaviar, Jucar, and Segura, flowing east to the Mediterranean. The Minho, Douro, Tagus, Guadiana, and Guadalquivir, flowing mostly through Portugal west and south to the Atlantic. Few of these are navigable, and those only for small boats near their mouths.

Spanish Colonies.—The principal are Cuba, Puerto Rico, and some smaller islands in America; the Philippine and Marrianne Islands in the Pacific, the Canary Islands in the Atlantic, Fernando Po and the Island of Annabon in the Gulf of Guinea, and Ceuta, Gomera, and Melilla in Barbary.—For a full account of the Colonies, see articles under these heads.

The Public Debt of Spain.—The following is an official return of the state of the public debt of Spain on the 30th of June, 1855:

	Reals.
Three per cent. stock, payable to bearer, and inscriptions transferable and non-transferable (internal)	2,081,011,544
Ditto given as guarantees for loans and contracts	543,012,000
Ditto deferred	1,597,189,456
Three per cents (foreign)	713,594,910
Ditto deferred	316,978,400
Consolidated bonds and other internal stock, bearing 4 per cent. interest	55,869,492
Five per cent. stock and inscriptions, transferable and non-transferable	134,178,119
Redeemable debt, 1st class	331,201,486
Certificates of current debt at 5 per cent. in paper (Certificaciones de deuda corriente al 5 por 100 á papel)	495,393,238
Non-consolidated bonds	90,847,622
Laminas Provisionales	56,867,583
Bonds payable to bearer of redeemable debt, 2d class	265,400,000
Provisional documents for interest on the deuda corriente à 5 por 100 á papel	129,552,659
Bonds of all kinds of the debt without interest (deuda sin interés)	387,328,678
Inscriptions of active debt, 5 per cent.	14,260,000
Inscriptions of English claims, 5 per cent.	90,000
Ditto in favor of French treasury	278,268,123
Ditto United States	12,000,000
Foreign passive debt	33,504,000
Inscriptions of old foreign 5 per cent. debt	79,852,000
Ditto foreign 3 per cents of 1831	1,786,133
Actions of national loan of 1821	3,774,000
Certificates of premium on the Lafflitto loan	2,301,300
Deferred debt of 1851, without interest	122,310,000
Bonds payable to bearer of foreign redeemable debt, 2d class	970,964 000
Capitals recognized to the owners of lay tithes	115,075,725
Certificates of ditto, and interest on the same	39,677,298
Proprietors of quitrents of the order of St. John of Jerusalem	91,400
Interests of the inscription in favor of the French treasury	183,760,874
Capitalizable interest at 3 per cent.	38,736,457
Interests of 4 and 5 per cent. debt, home and foreign	18,543,623
Interest in paper of the 5 per cent. current debt	407,040,748
Bonds issued for personal services (1st class).	23,978,124
State paper issued for railway undertakings (acciones de ferro carriles)	192,200,000
Loans (by decrees and laws) of 1835, 1841, 1850, 1851, and 1852	192,880,000
Treasury bills, preferable, with interest	12,251,884
Ditto, non-preferable	42,601,070
Ditto, preferable, without interest	149,870
Ditto, non-preferable, without interest	1,068,694
Total Reals, 1855	13,580,466,110

The same report states that the total amount of redeemable debt, including 1st and 2d class, purchased

since the law of 1851 to the end of June, 1855, was 934,935,271 reals, and cost the state 67,10',134 reals.

The climate of Spain varies exceedingly with elevation and position; it is warm on the coasts; the tablelands are exposed to great heat in summer, and extreme cold in winter. The soil is generally fertile, except in the elevated and arid districts of the central provinces; the chief crops are wheat, maize, barley, rice, hemp, and flax. The amount of corn is often insufficient for home consumption. The wines of Spain are much esteemed; the principal growths are those of Xeres (sherry), Rota, Malaga, Alicante, Malvasia, and Val de Penas; the other products are soda (from marine plants), honey, wax, and silk, the latter very abundant in the southeastern provinces. In the southern provinces the sugar-cane and cotton have been acclimatized, and there the orange and citron grow in great abundance. The best building timber grows in the northern coast; the cork-tree, the kermes oak, and the shumac-tree, yield valuable products. The horses of Andalusia are celebrated; the mules and asses are remarkable for beauty and size. Cattle are of good breeds. The race of sheep called the merino yields a great quantity of excellent wool; their exportation has always been prohibited, their pasturage is regulated by ancient laws, and their number is reckoned at five or six millions.

Commerce.—There is not at this time, nor has there ever been, a commercial treaty between the government of the United States and that of Spain. But two treaties of any kind have been negotiated between the two governments—one purporting to be "A treaty of friendship, limits, and navigation," signed October 27, 1795; the other, "A treaty of amity, settlement, and limits," February 22, 1821.

In regard to navigation, the first-mentioned treaty provided chiefly for a state of war, and prescribed the immunities and privileges to which the vessels of each should be entitled, in such a contingency, in the ports, harbors, bays, etc., of the other.

By article 1st, the contracting parties agree that there shall be a firm and inviolable peace and sincere friendship between his Catholic Majesty, his successors and subjects, and the United States and their citizens, without exception of persons or places.—*Art.* 7. The citizens and subjects, vessels and effects, of each of the parties, not to be liable to embargo or detention for any military expedition, or other public or private purpose, by either party.—*Art.* 13. In the event of a war between the contracting parties, the merchants residing in the dominions of either to be allowed one year from the declaration of war to remove their effects.—*Art.* 18. Ships of war of either party, when exercising right of search, to remain out of cannon-shot, and to board with two or three men only; and having seen passport, not to molest in any manner, nor force to quit her intended course, the vessel so visited. *Art.* 19. Consuls to be reciprocally established, and to be entitled to the privileges and powers enjoyed by those of the most favored nations.—*Art.* 22 (1st section). The two contracting parties to give in future to their mutual commerce all the extension and favor which the advantages of both countries may require.

The treaty of 1819, so far as it relates to navigation, confirms all the foregoing stipulations of the treaty of 1795; and as no limit was assigned to the duration of that treaty, those stipulations are still in force, and, with subsequent acts of legislation, regulate the intercourse, navigation, and commerce between the United States and its citizens, and the King of Spain, his successors and subjects, between whom it is agreed "there shall be a firm and inviolable peace and sincere friendship, without exception of persons or places." The commerce between the United States and Spain, though at all times employing but a limited capital, commenced at a period long anterior to the American Revolution. The British-American colonists were permitted, by act of Parliament, to carry on a direct trade in all articles, except tobacco and naval stores, with countries south of Cape Finisterre. This trade consisted principally in exporting from the colonies lumber, laths, and other produce (tobacco and naval stores excepted), and in bringing home return cargoes of wine, salt, fruits, and other productions of the Spanish peninsula.

After the peace of 1783, a more unrestricted trade was opened between the two countries; but, owing to the prohibition on tobacco (a policy adopted for the purpose of encouraging the growth of that article in the Spanish colonial possessions), and the high protective duties on most of the other leading staples of the United States, the trade could not have realized any hope of profitable investment, or given much encouragement to commercial enterprise. The wines, fruits, olive oil, salt, brandies, barilla, silks, and wools of Spain, would constitute a profitable and an easy exchange for the productions of the United States, particularly breadstuffs, tobacco, and cotton, if that country could be induced to relax a system of restrictive policy which has never realized the benefits it was designed to secure, and has virtually rendered Spain, to a great extent, commercially isolated from the other nations of the earth. Her legislation in regard to commercial intercourse with foreign countries would seem to be based upon the principle of possessing and securing within herself all the advantages of an extensive commerce, and all the means of luxury, wealth, and power—a principle which, however gratifying to national vanity it may be in theory, needs no other proof of its utter impracticability, if not of its inevitably pernicious consequences, than a reference to what is known of the history of Japan or China, or even to the commercial condition of Spain herself during the last half century. She has ever maintained and exercised the right to be the sole arbiter of her commercial regulations, and, as such, permits no foreign interference with her policy of excluding from her ports the produce of the industry and soil of other nations. Two features stand prominently forward in this exclusive and restrictive system: the first, the exclusion of commodities from any country, except her colonial empire, especially before its dismemberment and consequent diminution; and, secondly, by compelling the latter to consume no manufactured articles except those of Spain, with the view that all the precious metals should be sent to the mother country, where they would remain if no foreign merchandise was admitted. Notwithstanding these precautions, the precious metals were drained off to foreign countries, in exchange for the enormous contraband importations smuggled into Spain, by way of the Basque provinces, through Portugal; by way of the Mediterranean; and also even, as they were, and are to the present day, by way of Gibraltar. Besides, an extensive contraband trade with the Spanish settlements in Cuba and South America was carried on by the British-American colonies, thus draining off a large portion of the precious metals, which it was the policy of the mother country to monopolize, at a cost so fatal to her commercial prosperity. This contraband trade was, however, arrested, and after a short time totally suppressed, by the vigilance of the *guarda-costas* stationed by Spain along the coasts, and by the indiscriminate seizure of all British colonial vessels found near the shores of the Spanish colonies.

The trade with Spain of late years exhibits in a most striking manner the pernicious effect of a system of commercial intercourse which, however well it may have fulfilled its ends when Mexico, the West Indies, the South American republics, and the Spanish Polynesian Islands all poured their united treasures into the lap of Spain, and thus rendered her to a certain extent independent of other nations, has long since proved to be the most serious, if not the only, obstacle to her regaining the proud and prominent position she once held in the family of nations. The difference in the amount

of exports between the periods of 1834 and 1854 is attributable to the partial relaxation of the restrictive system within the past few years, particularly the modifications which the tariff has undergone since 1849; but the great disproportion between imports and exports, resulting in so large a balance against Spain, shows that the prohibitions and restrictions are as yet but partially abated.

Of the article of tobacco, about 6,000,000 lbs. is smuggled annually from Gibraltar into Spain, and about 4,000,000 lbs. is exported from the same depôt to Oran, Algiers, Malta, and other places. Spain, in the face of this contraband, still maintains her royal tobacco monopoly. Exclusive of the tobacco smuggled into Spain from Gibraltar, it is smuggled along the whole north and west coasts of Spain. The extension of the Spanish customs to the sea-coasts and ports of Biscay in 1844 has not diminished, but, it is asserted, has greatly increased, the contraband trade.—MACGREGOR, parts 13 and 14, p. 95.

Notwithstanding the apparently satisfactory results, the commerce of the United States with Spain, in American bottoms, is perceptibly declining. Various causes conspire to this result, among which may be regarded as the most prominent the enormous differential duties imposed on imports under all foreign flags, and the discriminating duties of port and navigation, amounting to 100 per cent. on American vessels in favor of national, and what is styled "privileged vessels;" or, in other words, the vessels of nearly all other foreign nations. Besides, American vessels are frequently exposed to local restrictions (doubtless unauthorized by the government) in the different ports, to which they must either quietly submit, or incur all the expense, delay, and trouble of protesting against the action of officials whose power in such cases is as unlimited as its exercise is arbitrary and oppressive. Vessels of the following nations are ascertained to be of this class: England, France, Holland, Portugal, Russia, Prussia, Sardinia, Belgium, Hamburg, Sweden and Norway, Tuscany, Bremen, Papal States, Denmark, Brazil, Ecuador, Lübeck, Hanover, Mecklenburg, Oldenburg, and Sicily.

This has been a subject of frequent complaint on the part of American captains, but thus far without obtaining relief. The United States consul at Malaga, under date of April 3, 1851, adverting to this subject, says: "Although subject to the Central Board at Madrid, [quarantine regulations] are almost entirely under the control of the local board of this city, * * * ordering vessels off to lazarettos, * * * in the face of clean bills of health certified by Spanish consuls, upon mere reports, without any official information to warrant such extraordinary measures."

The following table will show, approximately, to what extent the direct trade between the United States and Spain has fallen off within the past few years. Most of this trade is carried on through the port of Malaga.

TONNAGE OF AMERICAN VESSELS ENTERED AT THE PORT OF MALAGA IN THE FOLLOWING YEARS.

Years.	Tons.	Years.	Tons
1846	15,276	1850	16,600
1847	12,288	1851	11,918
1848	15,699	1852	12,610
1849	13,052	1853	11,375

The falling off in tonnage which the above table exhibits is, however, perfectly reconcilable with the comparative tables for 1854 and 1832, when we take into consideration the fact that at least one-third of the exports to the United States is carried by privileged vessels; and even national vessels, notwithstanding the discriminating duty of 10 per cent. to which they are subject in the ports of the United States, participate largely in this carrying trade, for the purpose of returning with cargoes of cotton for Malaga and Barcelona, or with codfish from Newfoundland.

The great articles of export from Spain consist (exclusive of silk manufactures) of raw products. Of these wine, olive oil, wool, fruits of various kinds, lead, quicksilver, brandy, cork-wood, salt, raw silk, wheat, etc., are the most important, and are almost all susceptible of an indefinite increase.

The great articles of import are colonial products, obtained principally from Cuba, Porto Rico, etc.; cottons and cotton wool; linens, and hemp and flax; woolens; salted fish; hardware, glass, and earthenware; timber, rice, hides, butter and cheese, etc. Subjoined is

AN ACCOUNT OF THE VALUES OF THE PRINCIPAL ARTICLES OF NATIVE PRODUCE EXPORTED FROM SPAIN IN 1849, SHOWING ALSO THE PROPORTIONAL VALUE OF EACH ARTICLE.

Articles in the Order of their importance.	Value in Reals Vellon	Amount per Cent. of Total Value.

The importance of the trade that Spain formerly carried on with her vast possessions in the New World was at all times much exaggerated; and she, in truth, was little better than an agent in the business, the greater part of the goods sent on Spanish bottoms to the colonies being, in reality, the property of foreign merchants. Spain, notwithstanding the emancipation of Mexico and South America, has still some very valuable colonies; and, if nothing else can, the astonishing progress made by Cuba and Porto Rico since the abolition of the prohibitive system, should satisfy her of its ruinous tendency.

New Organization of Ports.—By royal decree of February 28, 1854, a new organization is made of the customs service by land and sea, the principal features of which it may be interesting to the mercantile interests of the United States to have noted. As regards the sea, it divides the service into four classes. The first class comprises importation, exportation, re-exportation, coasting-trade, and all other commercial operations in the ports of Alicante, Almeria, Barcelona, Bilboa, Cadiz, Carthagena, Palma de Majorca, San Sebastian, Santander, Seville, Tarragona, and Vigo. In the second class, comprising the ports of Carril, Palo-

mas, and Rivadeo, the importation of cotton tissues is not to be permitted. In the ports of the third class, comprising those of seventeen provinces, only certain specified articles, principally raw materials, are to be imported and exported; and in those of the fourth class, comprising sixteen provinces and the Balearic Isles, only coasting-trade operations and exports are to be allowed. As regards the land, it is divided into three classes, and the regulations are framed solely with a view to prevent smuggling. They do not, however, possess sufficient interest for insertion here at length.

The principal ports are, Alicant, a sea-port in Valencia, lat. 38° 20′ 41″ N., long. 30′ W. The harbor is open and spacious, between Cape de la Huerta on the northeast, and Isla Plana on the south, distant from each other about ten miles. Ships of considerable burden moor from one-fourth to one mile from shore, in from 30 to 40 feet of water; they are exposed to all winds from the east-northeast to south by west; but the holding-ground is good, and there is no instance of a ship having been driven from her moorings in the past twenty years.

Barcelona, the principal town of Spain on the Mediterranean, in lat. 41° 22′ N., and long. 2° 10′ E. The harbor is naturally bad, and is formed by a mole or jetty. The depth of water within the mole is from 18 to 20 feet; but there is a bar between the mole and Moujui, and which has frequently not more than ten feet. Vessels inside the mole are safe. Large vessels have to anchor outside, and are much incommoded by the winds.

Bilbao, sometimes incorrectly written Bilboa, a sea-port in the Bay of Biscay.

Cadiz, the principal commercial city and sea-port of Spain, on its southwestern coast, on the rocky and elevated extremity of a narrow, low peninsula, or tongue of land, projecting from the Isla de Leon N.N.W. about 4½ nautical miles. It is surrounded on all sides except the south—where it joins the land—by the sea, and is very strongly fortified. Population in 1837, 58,525. It is well built, and has at a distance a very striking appearance. The tower or light-house of St. Sebastian stands on the western side of the city, being in lat. 36° 31′ 7″ N., long. 6° 18′ 52″ W. It is a most conspicuous object to vessels approaching from the Atlantic. The light, which is 172 feet high, is of great brilliancy, revolves once a minute, and in fair weather may be seen more than six leagues off.

Bay of Cadiz.—The entrance to this noble basin lies between the city and the town and promontory of Rota, bearing northwest by north, distant about 1½ leagues. The bay is of very great extent, affording in most places good anchorage. The port is on the eastern side of the city, where a large mole has been constructed.

By a royal order of January 3, 1852, it was decreed that all foreign vessels belonging to countries where Spanish vessels are placed on the same footing as national, with respect to port dues and charges, should enjoy a like privilege in the ports of Spain and adjacent islands; but, practically, this decree was not permitted to apply to vessels of the United States, and they continued subject to double the amount of such dues and charges paid by other foreign and the national vessels. The reason for the non-fulfillment of this provision, as respects this country, was the refusal of the government of the United States to receive vessels in its ports on equal terms from Cuba and Porto Rico; and the government of Spain refused to accede to such condition, as it desired to secure this benefit for its marine, from wheresoever her vessels might proceed. On the 16th of June, 1854, however, the American minister at Madrid was officially informed by the Spanish Minister of State that her Majesty the Queen had been pleased to command that American vessels "be considered in the peninsula and adjacent islands like national ones, as regards the duties of port and navigation, in reciprocity for what is practiced with the Spanish vessels proceeding from the same places in the United States, and with reference to the same duties." The official notification added, that corresponding orders had been given, "under date of the 14th inst., to the general direction of custom-houses and tariffs," to carry into effect the dispositions of this order.

The effect of the above-recited royal order will be to place American shipping on an equality, as respects the duties of port and navigation, with national and privileged vessels, and thus reciprocate the terms on which Spanish vessels have been admitted into the ports of the United States since 1852. Should this be followed up by a liberal modification, or an entire abolition, of the enormous discriminating duties levied on foreign imports in the ports of Spain, the commercial intercourse between the two countries would soon become a source of industrial development and national prosperity, equally beneficial and profitable to each. The quarantine regulations of Spain have always been complicated and vexatious. They were simplified, however, by a sanitary tariff, promulgated December, 1855, a translation of which is subjoined:

TARIFF OF SANITARY DUTIES EXACTED IN THE PORTS AND LAZARETTOS OF SPAIN.

Entrance Duties.—Coasting vessels of more than twenty tons burden will pay one quarter of a real per ton for the round voyage.

Vessels proceeding from the ports of the Mediterranean and other ports of Europe, including the coast of Africa to the parallel of the Canary Islands, will pay one half of a real per ton for the round voyage.

Vessels from other places will pay one real per ton each voyage.

Quarantine Duties.—Vessels of every class will pay one quarter of a real per ton each day they are subject to quarantine, whether in actual lazarettos or undergoing observation.

Lazaretto Duties.—The fee for each person in the lazaretto will be four reals per diem.

Merchandise subject to purification will pay as follows:

The clothing and baggage of each of the crew	5 reals
The clothing and baggage of each passenger	10 "
Hides of cows, per 100	6 "
Fine skins	6 "
Goat, sheep, lamb-skins, and the skins of other small animals, per 100	2 "
Feathers, goats'-hair, soft hair, wool, cotton, hemp, and flax, per quintal	1 "
Large live animals, such as horses and mules, each	8 "
Small animals, each	4 "

Certificates of Health shall be made out, and legally attested, free of charge.

Regulations.—Vessels in quarantine defray all the expenses attending the discharge of merchandise, its transfer to the sheds and work-houses, and its purification. They, in like manner, pay as an additional duty, the expenses attending the application of hygiene measures, which must be employed before the departure or arrival of the embarkations, as the regulations dispose, or as the condition of the vessel may require. During all the incidents of quarantine, every possible facility is to be afforded to vessels, no expense being permitted without the knowledge or consent of the captain, agent, or consignee. All persons who perform quarantine in the lazarettos defray all the necessary expenses, inasmuch as the four reals per diem which is exacted from each is only the fee for residence.

Where Spanish vessels are about to depart from a port of the United States with any goods, wares, or merchandise, for any destination other than some port or place in the islands of Cuba or Porto Rico, the bond and security required by the 3d section of the act of 30th June, 1834, are exacted in all such cases, before allowing clearance or departure of the vessels.

A Spanish vessel leaving a port of Spain for a port in Cuba, but, not finding there a satisfactory market,

proceeding, without breaking bulk or taking in any goods at said island, to a port in the United States, would not on entry be subjected to any other or higher duties of tonnage or imposts than she would be if direct from a port of Spain to the United States; the voyage, under the circumstances, being regarded as continuous.

COMMERCE OF SPAIN IN THE YEAR 1854.

		Entered.		Cleared.	
		Vessels.	Tons.	Vessels.	Tons.
1853	Loaded	6698	795,140	5787	629,681
	In ballast	2068	189,837	1041	158,130
	Total	8766	984,977	6828	787,811
1854	Loaded	6173	756 525	7376	828,807
	In ballast	2974	306,809	696	95,326
	Total	9447	1,063,334	8072	924,223

The marine service of Spain in 1855 consisted of four vessels of the line, nine frigates, eight corvettes, fifteen brigs of the first, and four of the second class; five schooners, six sloops, forty steamers, and three hundred and nineteen smaller craft, mounting in all 1250 ordinary, and 280 swivel guns.

The imports into and exports from Spain for the year 1856 are shown as follows:

	Value in Reals.
Imports of 1856	879,771,700
Imports of 1855	764,150,259
Increase in 1856	115,621,441
Exports in 1856	1,043,610,106
Exports in 1855	1,246,784,599
Decrease in 1856	203,174,493

From this exhibit we see that in the aggregate there was a decided decrease in the trade of Spain in the year 1856 over that of 1855.

Statement showing the American merchant vessels which arrived at Cadiz in five years, 1849 to 1853 inclusive:

Years.	Vessels.	Men.	Tons.
1849	63	801	24,310
1850	47	557	16,493
1851	46	614	18,553
1852	46	673	21,117
1853	30	379	11,667
Total	232	3024	92,140

American and other foreign vessels can only trade between Spain and other countries; they can not participate in any Spanish coasting, domestic, or internal trade.

The navigation and trade between the United States and Spain does not increase. The tariff of Spain excludes most of the staple articles of the United States, such as grain, breadstuffs, rice, tobacco, etc., the principal article of import from the United States being undressed oak staves for wine-casks. In order to promote navigation and trade between the two countries, it is necessary that high duties, prohibitions, and restrictive measures on both sides should cease.

COMPARATIVE STATEMENT OF THE COMMERCE OF THE UNITED STATES WITH SPAIN, INCLUDING THE CANARIES AND PHILIPPINE ISLANDS; EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH COUNTRY, DURING THE YEARS DESIGNATED.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Of the changes in the commercial policy of Spain the following particulars, furnished by the United States consul at Cadiz, will be found interesting:

"Ocronan 3, 1865.

"The Queen's decree of the 30th, and order thereon of the 31st of July of the present year, was issued, establishing a *Junta consultiva de aranceles*, or a board of consultation in relation to custom-house tariffs, regulations, and all matters relating to imports and exports, with extensive powers, and determining their attributions. The object of this board is declared to be to discuss and propose to the minister of the hacienda all reforms which they may conceive ought to be made in the custom-house tariffs, and to occupy themselves with and direct all the proceedings which may be found with respect to the understanding of the same, their application and modification; as also with respect to the reclamations of foreign powers, and those which ought to be made on the part of Spain, with respect to the agreements and treaties of navigation or commerce, and any other affair whatever relative to the mercantile legislation. This *Junta de aranceles* is to be a corporation independent in all points of any other office of the state; and as such is clothed with the same faculties, privileges, and pre-eminences which belong to the other directive centres of the ministry of the hacienda, of a permanent character. The junta is empowered, in the performance of its duties, to communicate directly with, and claim from, Spanish consuls in foreign countries, governors, and provernors of provinces, administrators of custom-houses, juntas of commerce, economical societies, etc., and any other authorities, offices, and corporations whatever, all *data* they may conceive necessary for the execution of the business committed to them. Copies of this decree and order are herewith, detailing at length the persons composing the junta, and the mode in which they are to proceed. This board is now organized, and is expected to make a report pending the next session of the Cortes. It is presumed that they will recommend the favoring of navigation under the *Spanish* flag; the admission of certain kinds of cotton manufactures, and other articles now prohibited; together with an augmentation of two millions of dollars in the custom-house revenue on imports; also the maintenance of the present monopolies of tobacco, salt, stamped paper, and the duties payable thereon."

Moneys, Weights, and Measures.—The weights and measures are the established ones of Castile; the *arroba* of solids being considered of 25 pounds, of 16 ounces to the pound; and of liquids, 32 *cuartillas*, except in the article of clive-oil, which will be deemed a solid. The *quintal* will be of 100 pounds, and the ton of 20 quintals. The yard will be of 36 inches. The money is the *real de vellon*, which is divided into 100 parts, called centimes.

Moneys.—The real vellon is valued at the custom-house of the United States at 5 cents; 20 real vellons =$1; the real of plate is double the real vellon=10 cents; 1 hard dollar=12½ dollar of exchange=10 reals of new plate=10⅝ of old plate=20 reals velion=170 quarters=361½ maravedis of old plate=680 reals vellon=$1 03½.

Gold Coinage.—The last date that we have noticed of the long-continued doubloon series of Peninsular coinage was 1824. The half doubloon of that year weighed 0·433 ounce, 865 fine; value, $7 75. The new gold coin is a piece of 100 reals, weighing 0·268 ounce, 896 fine, $4 96·3.

Silver Coinage.—The principal coin (not the largest) seems to be the piece of 4 reals, or pistareen, which before 1837 was of the weight 0·189 ounce; fineness, 810; value, 20·7 cents. The standards have been lately changed, and the new pistareen weighs 0·166 ounce, fineness, 899; value, 20·3 cents. There is also a large piece of 20 reals (dollar), worth 101·5 cents; and pieces of 10, 4, 2, and 1 real in proportion.—*United States Mint Report*, 1857.

Weights.—Gold and Silver Weight.—Gold and silver are weighed by the Castilian mark of 50 castellanos, 460 tomines, or 4800 grains.

Apothecaries' Weight.—The apothecaries' weight is the Castilian, but the ounce is divided into 8 drachmas, 24 escrupulos, 48 obolos, 144 caracteres, or 576 grains.

Commercial Weight.—One commercial pound is equal to 2 marks (Castilian), or 16 ounces. One commercial ounce=8 drachmas=16 adarmes=576 grains. One quintal of 4 arrobas, or 100 pounds,=101·44 pounds avoirdupois, or 46 kilograms. One arroba=25 pounds 7 ounces.

Measures.—Dry Measure.—Corn, salt, and other dry articles are measured by the cahiz. One cahiz=12 fanegas; one fanega=12 celemines. The celemine has various subdivisions, as ½, ⅓, ¼, etc. The fanega measures 4322¾ Spanish, or 3439 English cubic inches, and is equivalent to 1·55 English imperial bushels. Five fanegas are nearly equal to one quarter English.

Wine Measure.—One arroba of wine measures 4245 English imperial gallons. One arroba of oil, 3½ English gallons. One botta=30 arrobas of wine, or 38½ of oil. The botta contains 127½ English gallons, and the pipe 114¾ English gallons.

Long Measure.—One Spanish foot=12 pulgadas, or 144 lines, and is equivalent to 11·128 English inches, or 0·2826 of a French metre. One palmo, of 9 pulgadas, or 12 dedos,=8½ English inches. One vara, or 4 palmos,=33·384 English inches, or 0·847 of a metre. One braza=2 varas, or 6 feet. One passo=5 feet. One estadal=4 varas, or 12 feet. One cuerda=8¼ varas, or 25½ feet.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Specie (Fr. *espèce*), coin and bullion used as a circulating medium in distinction from paper money.—*See articles* BANKS, COINS, PRECIOUS METALS, GOLD, and SILVER.

Spectacles. An optical instrument, consisting of two lenses set in a frame, for assisting or correcting the defects of imperfect vision. The lenses are convex or concave, according to the nature of the defect to be remedied. In old age the pupil of the eye becomes flat, and the rays of light are consequently not refracted sufficiently in passing through it to meet on the retina and produce distinct vision. This defect is remedied by a convex lens, which produces a slight convergency of the rays before they enter the eye. Short-sighted people, on the contrary, require concave lenses; because, in their case, the indistinctness of vision proceeds from too great a curvature of the pupil, which causes the rays to meet in a point before they reach the retina—a defect which is remedied by giving the rays a slight divergency before they enter the eye. Spectacles were unknown to the ancients. They are generally supposed to have been invented in the 13th century, by Alexander de Spina, a monk of Florence, in Italy, about A.D. 1285.—*Gen. Hist.* They were invented by Roger Bacon, according to Dr. Plott, about 1280. Some affirm that the real inventor was Salvino; and Mr. Manni gives proofs in favor of Salvino in his *Treatise on Spectacles.*—HAYDN.

Spelter, a name frequently given to ZINC; which see.

Spermaceti (Ger. *Wallrath*; Fr. *Blanc de Baleine, Sperme de Baleine*; It. *Spermaceti*; Sp. *Esperma de Ballena*; Russ. *Spermazet*), a product obtained from the brain of the *physeter macrocephalus*, a species of whale inhabiting the Southern Ocean. The brain being dug out from the cavity of the head, the oil is separated from it by dripping. The residue is crude spermaceti, of which an ordinary-sized whale will yield twelve barrels. It then concretes into a white, crystallized, brittle, semi-transparent, unctuous substance, nearly inodorous and insipid. On being cut into small pieces it assumes a flaky aspect. It is very heavy, its specific gravity being 0·433. It is used in the manufacture of candles, in medicine, etc.

Spices (Ger. *Spezereyen*; Du. *Specerijen*; Fr. *Epiceries, Epices*; It. *Spezj, Spezierie*; Sp. *Especias, Especerias*; Port. *Especiaria*; Russ. *Prianie korenja*). Under this denomination are included all those vegetable productions which are fragrant to the smell and pungent to the palate; such as cloves, ginger, nutmegs, allspice, etc.

The ordinary spices which are used in housekeeping, and are sold by the grocer are *pepper* (white, black, and cayenne), *mustard, ginger, nutmegs, mace, pimento* or *allspice, cloves, cinnamon,* and *cassia.* All of these spices are more or less pungent to the taste and stimulating to the stomach, and are used as additions to food, not as food itself. For these qualities they depend upon an essential oil in most cases, varying in each particular case. Pepper, however, has a nitrogenized principle, similar in composition to thein and caffein, and called *piperin.*

Pepper is the produce of two allied plants (known as *Piper nigrum* and *longum*), and the part used is the berry, dried in the sun. *Black* and *white pepper* are both obtained from the berry of *Piper nigrum;* the former being the entire berry, ground, while the latter consists of the berry deprived of its outer covering, or husk, before it is reduced to powder. Long pepper is not ground, and is not much used in the present day. Pepper-corns, being these berries, are imported from Penang, Malabar, and Sumatra. The best are those

which are not too small, nor too much shrunk in drying, but which feel heavy in the hand, and sink in water. In looking at a section, the outer part, which is black, or reddish black, is easily distinguished from the inner or central, which is more or less white, and brittle, hard toward the exterior, and soft and powdery toward the centre. In separating these parts, as for the purpose of procuring the white pepper, an inner reddish covering remains attached to the internal white structure, and this being ground up with it, is faintly indicated in the pure white pepper-powder by small reddish specks. The active properties of this spice depend upon an *acrid resin*, an *essential oil*, and a substance before alluded to, called *piperin*. The outer cortical part contains the resin, in the inner coat lies the oil, and within the internal or white structure is the *piperin*.

Pepper, both black and white, is adulterated with a variety of articles—as, the flour of linseed, mustard, wheat, sago, and arrow-root. Pepper-dust, also, being the sweepings of the floors of warehouses, and known as P.D., is largely used in making up low-priced pepper. Powdered cayenne is likewise said to be used, but, according to Dr. Hassall, not to any extent. Chemistry and our natural senses are greatly at fault in detecting these adulterations; and the microscope is the chief means upon which reliance can be placed, and, as is proved, a very sufficient one.

Cayenne pepper is composed of the pods of several species of *capsicum*, which is an annual herbaceous plant, a native of America, cultivated in the West and East Indies, and to some extent in the United States. Each pod is made up of three parts, an outer skin, an inner parenchymatous substance, and a quantity of small seeds. All these are ground up to constitute the pepper sold as cayenne, but it is to the first that it chiefly owes its pungent taste. It contains a very active principle which is called *capsicin*, and of which a very minute quantity, even as little as half a grain, diffused throughout a room will set a whole party of people sneezing. This pepper is far more subject to adulterations than black and white pepper, and is in fact scarcely ever free from mixture either with red-lead, red-ochre, or common salt—four only out of ninety-eight samples examined by Dr. Hassall being perfectly genuine; thirteen presented red-lead, often in poisonous quantities, and in seven Venetian-red, red-ochre, or brick-dust, were found. Six of the samples contained salt in large quantities, with rice and coloring matter, and in the same number also appeared rice mixed with turmeric and cayenne, and colored with red-lead or some ferruginous earth. It is said that this pepper is often imported in a ground state, and therefore a good deal of this sophistication is due to foreign roguery. The mineral ingredients are easily detected by chemical means, as red-led, vermilion, etc.; but for the most of the other articles the aid of the microscope is again required. With a knowledge of the difficulty in detecting adulterations, it behooves us all to deal for our peppers only with those who are of high character and standing in the trade; but as our senses tell us pretty clearly the strength of the spice, and as all the adulterations of black and white pepper are tolerably innocent, no harm accrues, except to the purse, from the substitution of a weak spice for a strong one. In the case, however, of cayenne pepper, the presence of red-led, vermilion, or other mineral coloring matter is of serious importance, and should be cautiously avoided by a careful dealing with honest tradesmen.—*See* CAYENNE and PEPPER.

Mustard is obtained from the plants known as the black and white mustard plant (*Sinapis nigra* and *alba*). The former of these has smooth seed-vessels, and reddish or blackish-brown seeds, which are very pungent; while the latter has rough or hairy pods and yellow seeds, less pungent than those of the black mustard. The seeds of the black mustard are composed of cellulose matter, containing in addition a volatile and a fixed oil of mustard; also, two peculiar substances known as myronic acid and myrocene, all of which are deficient in white mustard seed. The fixed oil exists in the seed, but the volatile oil is formed in the same manner as the essential oil of bitter almonds, by the joint action of water, and a peculiar coagulable albuminous matter, called *myrocene*, upon a substance very imperfectly known, which is termed *myronic acid*. This acid has no smell, and is not volatile, but is bitter to the taste, and contains *sulphur* and *nitrogen*. Heat coagulates myrocene, which is necessary to the formation of the essential oil, and hence mustard should always be mixed with hot water to develop its pungent powers properly.

Adulteration in this article seems to be the rule, and a pretty invariable one; for in no single case did Dr. Hassall find pure mustard seed sold in London. The nature of the admixture was in nearly all cases the same, genuine mustard being more or less mixed with wheaten flour, and colored with turmeric. Even in the case of an article which was specially sent up from Newcastle-on-Tyne as a perfectly pure specimen, a very small quantity of turmeric was discovered, which the manufacturer afterward candidly admitted was added to the mustard for the purpose of heightening its color. This admission must be highly gratifying to the *Lancet* Commissioners, as the quantity was only two ounces in fifty-six pounds, or one part in 448. In purchasing mustard, there is no guide short of the microscope but the palate, as the full power is not developed until the flour is mixed with hot water. The adulterations are, however, only of importance as far as the money-value is concerned, as the turmeric is innocent enough of all other mischief. Most people can judge of the strength of this spice when it is used, and they may therefore readily take this as their guide in dealing with their grocer for future orders.

Ginger is cultivated in Asia, Africa, and the tropical parts of America, and is the root of the *Zingiber officinale*, a perennial plant, of which the stem reaches to the height of three or four feet. The roots are dug up at the end of the first year; they are well washed, and then they are stripped of their outer skin, or left as they are, constituting in this way the two primary divisions of ginger into *coated* and *uncoated;* in addition to which, it is sometimes imported from Jamaica in a *green* state, preserved in jars with sirup. The two first divisions are sold either in the state in which they are imported, or finely ground, and sifted with great care. Ginger owes its pungency to a volatile oil, with an acrid resin, which are contained in it, and mixed up with other vegetable substances, as gum, starch, and woody fibre. Ground ginger contains all the elementary principles of the root. It is adulterated with wheat flour, sago, potato flour, cayenne pepper, mustard husks, and turmeric powder, none of which are prejudicial to health, and the fraud is only on the pocket.

Nutmegs and *Mace* are both obtained from the nutmeg-tree, of which there are three species—*Myristica fragrans*, *M. fatua*, and *M. malabarica*. Together they are the fruit of the tree, which is similar in appearance to a pear-tree, and produces a fruit about the size of a peach, but shaped like a pear, and smooth externally. The outer fleshy part of this is the pericarp, and this when ripe separates into two longitudinal sections, within which lies the seed proper, or *nutmeg*, inclosed in two coats, besides the *mace*, which fills up the space between these and the pericarp. The tree known to botanists as *Myristica fragrans*, is cultivated in the Molucca Islands, as well as in Java, Sumatra, Singapore, Penang, the island of Bourbon, Bengal, Madagascar, and the West Indies; and these trees produce the *true nutmeg* of commerce, which is round, and of a strong aromatic flavor and smell. A second and inferior kind, called the *wild* or *false nutmeg*, is obtained from the *Myristica fatua* and *M. mala-*

barica, growing in a wild state; and they may be distinguished from the true nutmeg by being longer and paler than it. Mace is also *true* or *wild*, according as it is obtained from either kind of nutmeg-tree. As imported into this country, the true mace is of a golden or orange yellow, transparent and horny. False or wild mace is of a dark red color, and deficient in flavor and smell. The nutmeg, as well as the mace, contains a fixed, and also a volatile oil, as well as starch and woody matter.

Adulteration.—It might readily be supposed, as these spices are not powdered, but are sold as imported, that no adulteration could possibly be practiced; and it appears, in reality, that very little is attempted. The only fraud is found to consist in the abstraction of the volatile oil by distillation, which deprives the nutmeg and mace of their chief flavor and utility as spices. In order to preserve the nutmeg from insects, it is often soaked in lime water, or covered with powdered lime; but this does not seem to be a fraud, but rather a preservative. It therefore need not be guarded against, but the presence of the full complement of oil should, if possible, be insured. This can only be done in practice by attending to the flavor and smell, and comparing them with the recognized genuine article. The shape is a good guide to the true nutmeg, and purchasers should always select those of a round form, avoiding those which are like dates in appearance, or even at all elongated beyond a very slight departure from the true circle.

Pimento, or *Allspice*, also called Jamaica pepper, is the berry of a tree bearing the first name, and growing in the West Indies, from which it is imported in bags. There are two qualities of it, but only one is extensively used in this country.

Pimento, like most other spices, owes its qualities as a condiment to its essential oil, which is contained in considerable quantities in the berries mixed with gummy and resinous matter, astringent extract and fatty oil. This essential oil is readily obtained by distillation. The adulteration of this spice is so trifling as scarcely to require alluding to; and as the price of pimento at present in the London market is from 4½*d.* to 4¾*d.* per lb., with a duty of 5*s.* per cwt., the retailers make a fair profit in selling it at 8*d.* and need not have recourse to adulteration.—*See* PIMENTO.

Cloves are the flower-buds of the *Caryophillus aromaticus*, which is grown in the Moluccа Islands, Sumatra, the Mauritius, Bourbon, Cayenne, Martinique, and St. Vincent. They present a peculiar oblong appearance, too well known to need minute description, with a pungent and aromatic taste, which is highly agreeable to most people. Like the other spices, cloves contain an essential oil, besides resin, tannin, and woody fibre. The oil is extracted in considerable quantities, and sold separately for various purposes. The wholesale price is from 4½*d.* to 1*s.* 2*d.* per lb.; and the duty being 2*d.* per lb., together with the retailer's profit, bring them up to the retail price of 1*s.* for Bourbon and Cayenne, 1*s.* 4*d.* for superior Bourbon, and 2*s.* for Penang cloves.

Cinnamon and *Cassia* are the bark of two species of *Cinnamomum*; that producing the former bearing the specific name *Zeylanicum*. The cinnamon-tree is cultivated chiefly in Ceylon, but sparingly in Bombay, Malabar, and Java. The bark, as sold, is peeled from the three-year old branches, and dried in the sun; and its quality varies considerably, but its external characters are generally pretty nearly the same. Cassia, or the bark of the *Cinnamomum cassia*, is brought from China, Malabar, Bombay, and the Mauritius; it resembles the true cinnamon in flavor, though less delicate and not so sweet, and attended with a certain degree of bitterness. It is constantly substituted for cinnamon, and it is necessary, therefore, to endeavor to distinguish the one from the other by our ordinary senses, if possible.

The bark of cinnamon is not much thicker than drawing-paper, and breaks with an uneven margin, showing a coarse arrangement of its fibres. It also consists of several concentric layers of bark, one within the other. These are called *quills*, and are of a pale brown, with a sweet aromatic taste, unaccompanied by any bitterness or astringency.

Cassia bark is considerably thicker and coarser, and has a short fracture and smooth edge. It has generally only one, or at most two quills, within the external one; and the taste is a coarse imitation of cinnamon, with a strong tendency to leave an astringent bitter on the tongue. By these characters the bark of the one, when whole, may be distinguished from the other: but when powdered, the aid of the microscope is required to detect the imposition, which is extensively practiced; and, failing this, the character of the vendor is the only safeguard. Cassia buds are also imported.

The cinnamon of commerce is chiefly produced in the island of Ceylon, from the *Laurus cinnamomi* of botanists, the *Kooroondoo-gaha* of the Singhalese, a plant which appears to have flourished in that island from the earliest period. We learn from Scriptural history that this spice was employed by the Hebrews in their religious ceremonies; and there can be little doubt that their supplies were derived from the Arabian merchants who traded between the Red Sea and the East.

Mixed spice, as implied by the name, is a compound of the various ordinary spices, as ginger, pimento, cassia, etc. It is largely adulterated, and can not, therefore, be recommended, nor is its use at all required, inasmuch as the cook may in all cases use her own judgment to greater advantage.

Spikenard. This odoriferous plant belongs to the valerian order, and although its fragrance is generally considered unpleasant to European nostrils, it is so much admired by Eastern natives that some of the most esteemed Asiatic perfumes are composed of valerian and spikenard. The fragrance of spikenard is frequently mentioned in the Holy Volume. "While the king sitteth at his table, my spikenard sendeth forth the smell thereof." "There came a woman having an alabaster box of ointment of spikenard very precious." It is nevertheless unknown to English and French perfumers.—PIESSE'S *Art of Perfumery.*

Spinning. The art of spinning was ascribed by the ancients to Minerva, the goddess of wisdom, such was their veneration for it. Arcas, king of Arcadia, taught his subjects the art of spinning about 1500 B.C. Lucretia with her maids was found spinning when her husband Collatinus paid a visit to her from the camp. The wife of Tarquin was an excellent spinner; and a garment made by her, worn by Servius Tullius, was preserved in the Temple of Fortune. Augustus Cæsar usually wore no garments but such as were made by his wife, sister, or daughter. The spinning-wheel was invented at Brunswick about A.D. 1530. Till 1767, the spinning of cotton was performed by the hand spinning-wheel, when Hargrave, an ingenious mechanic, near Blackburn, made a spinning-jenny with eight spindles. Hargrave also erected the first carding-machine, with cylinders. Arkwright's machine for spinning by water was an extension of the principle of Hargrave's; but he also applied a large and small roller to expand the thread, and for this ingenious contrivance took out a patent in 1769. At first he worked his machinery by horses; but in 1771 he built a mill on the stream of the Derwent, at Cromford. In 1779, Crompton invented the mule, which is a further and wonderful improvement of this art.—PHILLIPS. *See* COTTON MANUFACTURE.

Spirit of Wine. *See* ALCOHOL.

Spirits. All inflammable liquors obtained by distillation—as brandy, rum, geneva, whisky, gin, etc.,—are comprised under this designation. See articles under these heads.

—*See* WINE.

Spithead, a celebrated roadstead, off the south coast of England, county of Hants, between Portsea island and the Isle of Wight. It communicates westward with the Solent and Southampton Water. It is so secure from all winds except the southeast, as to have been termed by sailors "the king's bedchamber," and it is a principal rendezvous of the British navy. Portsmouth and Ryde are on its opposite sides.

Splicing, among seamen, to join the two ends of a rope together, or to unite the end of a rope to any part thereof, by interweaving the strands in a regular manner. There are several methods of splicing, according to the services for which it is intended; all of which are distinguished by particular epithets. The term is also used in architecture.

Splinters, the pieces of a ship's side, masts, decks, etc., which, being knocked off by a shot, acquire great velocity, and frequently do more damage among the men than the shot itself.

Splinter-netting, sennit made into webs, and nailed upon the inner parts of a ship's sides, to lessen the effect of the splinters.

Sponge (Ger. *Schwamm;* Fr. *Eponge;* It. *Spugna;* Sp. *Esponja*), a soft, light, very porous, and compressible substance, readily imbibing water, and as readily giving it out again. It is found adhering to rocks, particularly in the Mediterranean Sea, about the islands of the Archipelago. It was formerly supposed to be a vegetable production, but is now classed among the zoophytes; and analyzed, it yields the same principles as animal substances in general. The inhabitants in several of the Greek islands have been trained from their infancy to dive for sponges. They adhere firmly to the bottom, and are not detached without a good deal of trouble. The extraordinary clearness of the water facilitates the operations of the divers. Smyrna is the great market for sponge. The price varies from 6 to 16 piastres per oke for ordinary and dirty, and from 80 to 100 piastres per oke for fine and picked specimens. Sponge is also fished for in the Red Sea.—URE'S *Dictionary;* SAVARY'S *Letters on Greece.* About 20 miles southeast from Napoli di Romania (Nauplia), in the gulf of that name, is the small town of Cranidi, the inhabitants of which are the principal sponge-fishers of the Archipelago and Levant. The fishery is carried on partly by spearing, and partly by diving; the latter securing the sponge free from injury, which is not the case with the former. The Cranidiots are most expert divers, and anecdotes approaching to the marvelous are told of their feats. After the sponge is fished up, when perfectly free from sand, and dry, it is so very light that large pieces of it are moved with the slightest breath of air. It is customary, however, to impregnate it with sand. This is done by stringing the sponges together, and laying them on the sand to allow the ripple of the sea to slush them with the finest particles. They are then placed in heaps under piles of stones which press them closely together, so that they become when dry hard and flat, and have to be beaten and sifted. But though this be done, and though they are sometimes further washed and sifted, they will, though apparently quite clean, weigh three or four times their original weight! It is, perhaps, needless to add that they are always sold by weight. The sponges found on the Florida coast are very good, and if the fishery was more extensively prosecuted would furnish us with our consumption.

Squill (Ger. *Meerzwiebel;* Fr. *Scille, Oignon marin;* It. *Scilla, Cipolla marina;* Sp. *Cebolla albarranna*), or, as it is sometimes denominated, the *Sea onion,* is a plant with a large bulbous root, which is the only part that is used. It grows spontaneously on sandy shores in Spain and the Levant; whence we are annually supplied with the roots. They should be chosen large, plump, fresh, and full of a clammy juice: some are of a reddish color, and others white; but no difference is observed in the qualities of the two sorts. The root is very nauseous, intensely bitter, and acrimonious; much handled, it ulcerates the skin. The bulbs are brought to market preserved fresh in sand. The acrimony of the roots, on which their virtue depends, is partially destroyed by drying and long keeping, and is completely destroyed by exposure to heat above 212°. Squill is one of the most powerful and useful remedies in the materia medica.—LEWIS'S *Materia Med.;* THOMSON'S *Dispensatory.*

Stade, a small city of Hanover, on the Schwinge, 22 miles west by north of Hamburg, lat. 53° 36′ 32″ N., long. 9° 28′ 34″ E. It has very little trade; and would be quite unworthy of notice in a work of this sort, except for the circumstance that a toll or duty, charged by the Hanoverian government on goods conveyed up the Elbe to Hamburg, whether for consumption or transit, used to be charged at the castle of Brunshausen, contiguous to this town. All vessels bound for Hamburg had to heave to (and those of some countries to anchor) in passing the guard-ship opposite to the castle, and send their papers, including manifests, bills of lading, cockets, etc., on shore, that the duty, which was in general about ¼ per cent. *ad valorem,* might be computed from them. This being done, the ship was allowed to proceed, and the duty was paid at Hamburg.—*See* ELBE. It is remarkable that an obstruction of this sort should have been tolerated for so long a period. The duties fell heavily on certain descriptions of goods, particularly on some manufactured articles; and were, at an average, decidedly higher than the duties charged in Hamburg. They are most objectionable, however, from their requiring many troublesome regulations to be complied with; the unintentional deviation from any one of which exposes the cargo to confiscation, and never fails to occasion a great deal of delay, trouble, and expense. As the principal part of the foreign trade of the Elbe is in our hands, we are, of course, principally affected by the Stade toll; and considering the source of the nuisance, it is not a little astonishing it should not have been abated long ago. The sum which the Hanoverian government derived from the duties is but trifling compared with the injury they inflicted on trade; it would, consequently, be good policy for the former to sell, and for the government to buy, an exemption from so vexatious a duty; and few things would do more to extend our trade with Hamburg than the completion of an arrangement of this sort. By an order from the Hanoverian government this duty has been abolished, and vessels are permitted to navigate the Elbe paying ordinary port dues.

Stained Glass. When certain metallic oxyds or chlorids, ground up with proper fluxes, are painted upon glass, their colors fuse into its surface at a moderate heat, and make durable pictures, which are frequently employed in ornamenting the windows of churches as well as of other public and private buildings. The colors of stained glass are all transparent, and are therefore to be viewed only by transmitted light. Many metallic pigments, which afford a fine effect when applied cold on canvas or paper, are so changed by vitreous fusion as to be quite inapplicable to painting in stained glass.—*See* GLASS.

Stamps, Stamp Acts. Stamps are impres-

sions made upon paper or parchment by the government or its officers for the purpose of revenue. They always denote the price of the particular stamp, or, in other words, the tax levied upon a particular instrument stamped, and sometimes they denote the nature of the instrument itself. If the instrument is written upon paper, the stamp is impressed in relief upon the paper itself; but to a parchment instrument the stamp is attached by paste and a small piece of lead, which itself forms part of the impression. These stamps are easily forged, and at various times forgeries of them upon a large scale have been discovered. The Stamp Act was one of the main causes of the American Revolution. In England all commercial paper must be stamped to give it validity. The State of Maryland passed a Stamp Act in 1845 as a source of revenue. By this act bills of exchange, promissory notes, bonds, mortgages, and lottery tickets, were to be stamped. The ordinary annual revenue of the State was from $70,000 to $80,000. The act was repealed in 1856, by the present British Stamp Act, the charges on bills of exchange, and notes, drafts, etc., ranging from 1d. to £2 5s.; on foreign bills, from 1 penny to 10s.; on wills, from 10s. to £270 or more.

Staple, "anciently written *estaple*, cometh," says Lork Coke, "of the French word *estape*, which signifies a mart or market." It appears to have been used to indicate those marts both in Great Britain and at Bruges, Antwerp, Calais, etc., on the continent, where the principal products of a country were sold. Probably, in the first instance, these were held at such places as possessed some convenience of situation for the purpose. Afterward they appear to have been confirmed, or others appointed for the purpose by the authorities of the country. All merchandise sold for the purpose of exportation was compelled either to be sold at the "staple," or afterward brought there before exportation. This was done with the double view of accommodating the foreign merchants and also enabling the duties on exportation to be more conveniently and certainly collected. Afterward the word staple was applied to the merchandise itself which was sold at the staple.—Bouvier's *Cyclopedia*.

Starch (Ger. *Amidam*; Fr. *Amidon*; It. *Amodi, Amito*; Sp. *Amidon, Almidon*; Russ. *Kruchmal*), a substance obtained from vegetables. It has a fine white color, and is usually concreted in longish masses; it has scarcely any smell, and very little taste. When kept dry, it continues for a long time uninjured, though exposed to the air. It is insoluble in cold water; but combines with boiling water—forming with it a kind of jelly. It exists chiefly in the white and brittle parts of vegetables, particularly in tuberose roots, and the seeds of the gramineous plants. It may be extracted by pounding these parts, and agitating them in cold water, when the *parenchyma* or fibrous parts will first subside; and these being removed, a fine white powder, diffused through the water, will gradually subside, which is the starch. Or the pounded or grated substance, as the roots of potatoes, acorns, or horse chestnuts, for instance, may be put into a hair sieve, and the starch washed through with cold water, leaving the grosser matters behind. Farinaceous seeds may be ground and treated in a similar manner. Oily seeds require to have the oil expressed from them before the farina is extracted.—Thomson's *Chem.*

Imports of Starch into the United States for the Year ending June 30, 1857.

Whence Imported.	Pounds.	Value.
Bremen	477	$34
Holland	44,375	1611
England	14,655	1009

Cuba	1,891	136
Mexico	3,151	233
China	1,570	47
France and Canada	590	28
Total	118,813	$6596

Stay, a strong rope from the mast head, leading forward to support it from falling aft. It takes the name of the mast, as the fore-stay, main-topmast stay, etc. *To stay*, means to tack. To be *in stays*, is to be in the act of tacking. To *miss stays*, signifies to fail in attempting to tack.

Steam Navigation. The statistics in regard to the steam navigation of the maritime nations of the world will be found under the heads of those countries. This article, therefore, will be limited, and be comprised under the following heads: I. Invention of the Steam-engine. II. Introduction and Statistics of Ocean Steam Navigation.

I. *Invention of the Steam-engine.*—The steam-engine is the most important power that the ingenuity of man has yet devised. The first idea of it was suggested by the Marquis of Worcester, in his Century of Inventions, as "a way to drive up water by fire." It does not, however, appear that this inventor ever derived any benefit or could interest the public in favor of his discovery. The following list includes the chronology of the most important inventions and improvements of the steam-engine.

	A.D.
Papin's digester invented	1681
Capts. Savery's engine constructed for raising water	1698
Papin's engine exhibited to the British Royal Society	1699
Atmospheric engine by Savery and Newcomen	1713
First idea of steam navigation set forth in a patent obtained by Hull	1736
Watt's invention of condensation steam	1765
Watt's first patent	1769
Watt's engines built on a large scale, and his patent renewed by Parliament	1775
Thomas Paine proposed the application of steam in the United States	1778
Engine made to give a rotary	1778
Watt's expansion engine	1778
Double acting engines proposed by Dr. Flock	1779
Watt's double engine constructed and patented	1781
Marquess Jouffroy constructed an engine on the Saone	1781
Fitch's experiments in steam navigation on the Delaware	1782–84
Oliver Evans's experiments	1785–86
Ramsey experiments in Virginia	1787
W. Symington made a passage on the Clyde Canal	1789
Chancellor Livingston built a steamer on the Hudson	1797
First experiment on the Thames	1801
Trevethrick's high pressure locomotive engine (see Railroads) first used	1802
Oliver Evans's experiments in locomotive engines in Pennsylvania	1804
Manufactories warmed by steam	1806
Fulton started a steamboat on the Hudson River, built by himself, named *The Clermont*; engine by Boulton and Watt; passage to Albany in thirty-six hours. First Record of practical Steam Navigation in the World	1807
The steamboats next in order in the world were, *The Car of Neptune*, New York	1808
The Paragon "	1811
The Richmond "	1812
Steam power first used on railroads by Blenkinsop	1811
Steam vessels commenced plying on the Clyde (First in Europe)	1812
Five steam vessels in Scotland	1813
Steam used in printing London *Times*	1814
First steam vessel on the Thames, brought from Glasgow	1815
First steamer *built* in England	1815
Steamer *Savannah*, of 350 tons, made the first ocean voyage from New York to Liverpool, in twenty-two days	1819
First steamer in Ireland	1820
Captain Johnson obtained £10,000 for making the first steam voyage to India in the *Enterprise*, which sailed from Falmouth August 16	1825
Locomotive steam-carriages on railways at Liverpool, October	1829
Locomotives first used in the United States on the Mohawk and Hudson Railroad	1831
On the Baltimore and Ohio Railroad	1832
The *Great Western* arrived from Bristol at New York, and the *Sirius* from Cork, Ireland, being their first voyages	1838
First steamer on the Cunard Line arrived at Boston, fourteen days eight hours, July 18	1840

—*See* Haydn's *Dictionary of Dates*; *see* Fulton.

II. *Introduction and Statistics of Ocean Steam Navigation.*—The first steamer that ever crossed the Atlantic was the *Savannah*, Captain Moses Rogers—a vessel that was built in New York, in 1818, by Fitchet & Crocket. The engine was built by Stephen Vail and Daniel Dod,

of New Jersey. It was a paddle-wheel steamer, of 350 tons burden and 90 horse power, and sailed from New York March 29, 1819, to Savannah, Georgia, where she was owned. She next went to Charleston to take the President, James Monroe, to Savannah, and from there, on the 25th of May, 1819, started for Liverpool, where she arrived safely in 22 days. She was a full-rigged ship, a fast sailer; had steam up fourteen days of the voyage, and by steam alone could make eight knots an hour. Steamboats coming into general use on rivers, lakes, and coasting voyages soon after, it seems a little singular that no further attempts were made for nineteen years to cross the ocean by steam. The success of this successful voyage seems to have been overlooked; the great philosopher, Dionysius Lardner, having proved—to his own satisfaction, at least—that steam vessels never could cross the Atlantic!

Finally, in Bristol, England—the very port that sent out John and Sebastian Cabot to make the first actual discovery of this continent—a line of steamers was projected, and the first vessel, the *Sirius*, arrived in New York on the 23d of April, 1838. The New York papers of that date say, "Myriads of persons crowded the Battery to have a glimpse of the first steam vessel which had crossed the Atlantic from the British Isles, and arrived safely in port." The London *Times* had spoken of the project doubtfully. "There is really no mistake," said the *Times*, "in this long-talked-of project of navigating the Atlantic Ocean by steam. There is no doubt of an intention to make the attempt, and to give the experiment, as such, a fair trial. The *Sirius* is absolutely getting under weigh for America." Now, after a lapse of 20 years, there are 15 lines of steamers, numbering 46 ships, trading between this country and Europe; and 37 of these steamers run out of New York. The earliest vessels—the *Sirius*, the *Great Western*, *Royal William*, *City of Liverpool*, *British Queen*, and the *President*—were none of them long in the trade. The line established by the enterprising Samuel Cunard, and to this day bearing his name, was started in 1840, and was the first permanently successful line of transatlantic steamers ever set afloat. The first Cunard steamer (the *Britannia*) arrived at Boston July 18, 1840.

Of the transatlantic steamers eight have been lost. The *President*, the *City of Glasgow*, and the *Pacific* sailed, and, with all on board, "were never heard of more." The *Arctic* was sunk in a collision with the French steamer *Vesta*, on the banks of Newfoundland, and but few lives were saved. The *Columbia*, the *Humboldt*, the *Franklin*, and the *City of Philadelphia* were all wrecked, but no lives were lost. Since the *Sirius* sailed from England to New York, in 1838, not far from 500,000 persons have crossed the Atlantic by steam—reckoning both passengers and crews, and the voyages both ways—and of this number about 1200 have been lost. This, in the doctrine of chances, is about one-third of 1 per cent., or one voyage in 300. With greater care, with the lessons of experience, and the aid of practical science, the percentage of loss will in future undoubtedly be far less.

In comparing the screw with paddle-wheel steamers, the latter have always been considered the swiftest vessels, and have generally made the best time. Screw steamers have many advantages over those with paddle-wheels. As war vessels they are more secure, the propelling power, as well as the most of the machinery, being below the water-line, and out of the reach of shot. The engine and machinery are less expensive, take less fuel, occupy far less space, and consequently afford more room for passengers and freight. They are not usually as rapid, nor are they as great favorites with the traveling public as paddle-wheel steamers. The motion of screw steamers is more unpleasant than those with paddle-wheels; there being nothing on the sides to balance and "trim" them, they have a lurching, rolling motion.

The ordinary time made by the Cunard and Collins paddle-wheel steamers between Liverpool and New York has been from 9 to 12 days. The monster steamer *Himalaya*—a British screw steamer of over 5000 tons burden—was sent under steam from Halifax to Southampton in about 9 days. Three other screw vessels—the *Emeu*, *Lebanon*, and *Alps*—steamed from Havre New York, respectively, in 11 days 17 hours, 13 21 hours, and 13 days 12 hours. These passages not far behind the usual speed of paddle-wheel steamers.

The following is the record of the various lines transatlantic steamers, and the average time going both east and west, during the year 1856. can not be taken as positive proof of the comparative speed of the different lines, for sometimes or two unfortunate trips will greatly increase the general average. The Boston branch of the Cunard longer voyages than the New York line, in consequence of the delay occasioned by putting into Halifax.

—PLINY MILES'S *Report on Ocean Steam Navigation*.

Great Britain.—To exhibit the extent of the employment of steam vessels in the British trade to the Mediterranean, India, and China, we give a summary of the steamers owned by the Peninsular and Oriental Company:

	Screw.	Paddle-wheel.	Total.
Number	21	19	40
Tonnage	30,622	22,715	53,737

The following tabular statement gives a full exhibit of the ocean mail service of Great Britain, now carried on almost exclusively by steamships:

Lines.	Number of Steamers.	Horse Power.	Tonnage.	Number of Men.	Service commenced.	How often	Annual Compensation.
Liverpool and Isle of Man	4	790	2,083	91	1833	2 a week	$4,250
England and Ireland	4	1,284	2,408	115	1850	2 a day	125,000
Scotland and Shetland	2	300	850	42	1840	1 a week	6,000
England, Spain, and Gibraltar	4	973	2,782	200	1852	3 a month	102,500
Mediterranean, India, and China	35	12,850	46,653	2577	1853	2 a month	1,121,500
England and the United States	9	6,418	18,400	922	1850	1 a week	866,700
North America (Colonial)	2	500	1,151	66	1854	1 a month	73,500
West Indies, Mexico, and South America	20	6,308	29,454	1667	1851	3 a month	1,350,000
England, France, and Belgium	6	640	1,765	96	1854	1 a day	77,500
Channel Islands	5	797	1,852	107	1848	3 a week	20,000
West Coast of South America	7	2,396	5,719	378	1852	2 a month	125,000
Scotland and Orkney	1	60	250	16	1856	1 a day	6,500
West Coast of Africa	7	850	5,051	320	1852	1 a month	106,250
South America, Mauritius, and Calcutta	5	2,000	8,000	575	1856	1 a month	205,000
England and Australia	7	3,290	13,410	671	1857	1 a month	925,000
Total	121	42,251	140,139	8137	....	....	$5,114,700*

* There are some lines not here noticed, which swell the sum to $5,333,985.

1. The mail routes from Great Britain to Australia are shown as follows:

The route from Great Britain to her Australian colonies, via the Cape of Good Hope, includes the following distances and lengths of passage:

	Miles.	Days.
Southampton to the Cape	6,100	30
Cape to Adelaide	6,100	28
Adelaide to Sydney	1,080	6
Sydney to New Zealand	1,200	6
Total	15,080	69

2. The Suez and Singapore route is made up as follows:

	Miles.
Southampton to Gibraltar	1,150
Gibraltar to Alexandria	1,890
Alexandria to Ceylon	3,150
Ceylon to Singapore	1,700
Singapore to Sydney	4,800
Sydney to New Zealand	1,200
Total	14,490

3. The distances by way of Panama are:

	Miles.
Southampton to St. Thomas	3,020
St. Thomas to Panama	1,100
Panama to Tahiti	4,490
Tahiti to New Zealand	2,290
New Zealand to Sydney	1,200
Total	12,600

The comparative distances show a decided advantage by the Panama route, and prove that the course of trade from Great Britain to her colonies must eventually tend that way.

The ocean mail steamers of Great Britain run 2,532,231 miles per year, at a total cost to the Admiralty of £1,062,797, or $5,333,985. The ocean mail steamers of the United States run 735,792 miles per year, at a total charge on the Post-office Department of $1,329,733. The British steamers run three and a half times as many miles as ours do, and receive for it a sum more than four times as large. The average price paid to their principal companies, as the West India Royal Mail, the Cunard, the Australian, and the Peninsular and Oriental, including its Mediterranean coasting service, is 9*s.* 7*d.*, or $2 39 per mile; while the average price paid by us, or for the Collins, Havre, Bremen, Aspinwall, and Panama, San Francisco and Oregon, is $1 80½ per mile. The highest sum paid per mile by the British government is 11*s.* 4½*d.*, or $2 83½, to the Cunard Company, $2 75 to the Australian, and $2 46 to the West India; and the lowest, 6*s.* 1½*d.*, or $1 53½ to the Peninsular and Oriental, much of whose service is coasting. This is saying nothing of the Pacific and the African coasting lines. The highest sum which we pay is to the Collins line, $4 10½ per mile; and the lowest to the Havre, $1 00½ per mile; while the sums paid to all of the other companies range but little above the last figures. The lowest rate per mile paid to any of the lines under the contract was to the Pacific Mail, $1 70. It must not be forgotten that the low rates per mile of the Havre and Bremen result from those lines taking the postages since their contracts expired—a sum by no means adjusted to the service done. They had ships that they could not let lie idle. Under their regular contracts the pay per mile of the Bremen line was $2 08, and of the Havre $1 76½. While the British government pays to four of her principal transmarine services an average of $2 83 per mile, we pay to five of ours an average of $1 80½ only, or but about two-thirds as much as she does. While our total annual expenditure for foreign mails is $1,329,733, a sum by $20,267 less than that paid to the single service of the West India Royal Mail Company, that of Great Britain is $5,333,985. And while our total income from transmarine postages is $1,035,740, a sum but little short of that paid in subsidy, taking the present Bremen and Havre services at the estimates of last year for sea and inland postages combined, the income from the whole transmarine service of Great Britain, including ocean and inland postage, was, when the last report was made in 1853, £551,573, or $2,957,865; but little above half the sum paid in subsidy, and including the French, Belgian, and Dutch routes, where the postal yield was much greater than from the ocean lines. The estimates which we present below have been made with great care from distances and subsidies furnished us by the reliable First Assistant Postmaster-general, Hon. Horatio King, from the last report of the late Postmaster-general, and from the report of the British Postmaster-general, Lord Canning, before noticed. Every item is consequently authentic.

American Mail Steamers.

Lines.	Trips.	Distances.	Subsidy.	Gross Postage.	Total Miles.	Pay per Mile.
Collins	20	3,100	$385,000	$415,867	124,000	$3 10½
Bremen	13	3,700	128,937	128,937	96,000	1 34
Havre	13	3,270	88,484	88,484	85,020	1 00½
Aspinwall	24	3,900	290,000	139,616	153,600	1 88½

Total average per mile, $2 10½. Average of four principal lines, $2 39.

* The Peninsular and Oriental Company run twice per month between Southampton and Alexandria, and between Suez and Calcutta and Hong Kong; twice per month between Marseilles and Malta; between Singapore and Sydney every two months; and three times per month between Southampton and Gibraltar, touching at Vigo, Oporto, Lisbon, and Cadiz.

It would hardly be expected that the lines of this country should run at cheaper rates than those of Great Britain, as the prime cost of ships and their repairs, fuel, wages, insurance, etc., are much cheaper there, and as they have more paying freights, in their manufactured goods. It only explains to us, what has al-

ways seemed a mystery, that while the regular companies in England were making money, nearly all of those in the United States not only had not made money, but were embarrassed more or less, and were selling their stock at 60 to 80 cents on the dollar.

The history of commercial nations admonishes us that no trading people can long maintain their ascendency without using all of the most approved means of the age for prosecuting trade. Portugal was at one time the most powerful commercial nation of the globe; and at another Holland was the mistress of the seas. But while the latter is now only a fourth-rate commercial power, the former has sunk into obscurity, and is nearly forgotten of men. At that time England and France had but a limited foreign trade, and scarcely any commercial reputation. France could more easily maintain her existence without a foreign trade than could England; and yet her matured manufactures and her products of the soil became so valuable that she sought a foreign market. England, on the contrary, had not territory enough to remain at home and yet be a great power. She matured an immense manufacturing system, and needed a market, as well as the raw material, and food for her operatives. She began to stretch her arms to the outer world, and had made very considerable strides in foreign commerce side by side with France and the German States, and in the face of the steady young opposition of the American States.

It is interesting to trace this rapid progress of steam since its first application to purposes of mail transport in 1833. An intelligent writer says, "The rise and progress of the ocean steam mail service of Great Britain is second in interest to no chapter in the maritime history of the world;" and while we acknowledge a grateful pride in the triumphs of our transatlantic brethren, we must blush with shame at our dereliction in this great, and civilizing, and enriching service of modern times. The steam marine of the United States, postal, mercantile, and naval, is to-day so insignificant in extent that we do not feel entirely certain that it is a sufficient nucleus for the growth of a respectable maritime power. The few ships that we possess are among the fleetest and the most comfortable that traverse the ocean, and have excited the admiration of the world wherever they have been seen. But their number is so small, their service so limited, their field of operation so contracted, that our large commerce and travel are dependent, in most parts of the world, on British steam mail lines for correspondence and transport, or on the slow, irregular, and uncertain communications of sailing vessels. The question here naturally suggests itself: Have we progressed in ocean steam navigation in a ratio commensurate with the improvements of the age, or of our own improvement in every thing else? And has the government of the country afforded to the people the facilities of enterprise and commercial competition which are clearly necessary to enable them to enter the contest on equal terms with other commercial countries?

List of American Ocean Steamers.—The mail service has eight lines, and 21 steamers in commission, of 48,027 registered tonnage. Much of this tonnage belongs to supply-ships, as for instance those of the Pacific Mail Steamship Company.

Collins Line.—Three steamers, 9727 tons: *Adriatic*, 4144 tons; *Atlantic*, 2849 tons; *Baltic*, 2733 tons.

Havre Line.—Two steamers, 4518 tons: *Arago*, 2240 tons; *Fulton*, 2808 tons.

Vanderbilt Bremen Line.—Three steamers, 6523 tons: *North Star*, 1867 tons; *Ariel*, 1296 tons; *Vanderbilt*, 3360 tons.

United States Mail Steamship Company.—Six steamers, 8544 tons: *Illinois*, 2128 tons; *Empire City*, 1751 tons; *Philadelphia*, 1238 tons; *Granada*, 1058 tons; *Moses Taylor*, 1200 tons; *Star of the West*, chartered, 1172 tons.

Pacific Mail Steamship Company.—Thirteen steamers, 15,421 tons: *Golden Gate*, 2067 tons; *Golden Age*, 2280 tons; *J. L. Stephens*, 2189 tons; *Sonora*, 1610 tons; *St. Louis*, 1691 tons; *Panama*, 1067 tons; *California*, 1085 tons; *Oregon*, 1069 tons; *Columbia*, 777 tons; *Republic*, 850 tons; *Northerner*, 1010 tons; *Fremont*, 576 tons; *Tokopo*, 189 tons.

Charleston, Savannah, Key West, and Havana.—One steamer; the *Isabel*, 1115 tons.

New Orleans and Mexico.—One steamer; the *Tennessee*, 1149 tons.

The Coasting Service has eight lines, and 23 steamers, of 24,071 tons registered tonnage.

New York, Havana, and New Orleans.—Two: The *Black Warrior*, 1556 tons; *Cahawba*, 1643 tons=3199 tons.

New York, Havana, and Mobile.—One: The *Quaker City*, 1428 tons.

New York and Savannah.—Four: *Alabama*, 1261 tons; *Florida*, 1261 tons; *Augusta*, 1310 tons; *Star of the South* (propeller), 900 tons=4732 tons.

New York and Charleston.—Four: *Columbia*, 1347 tons; *Nashville*, 1220 tons; *James Adger*, 1151 tons; *Marion*, 962 tons=4680 tons.

New York and Virginia.—Two: *Roanoke*, 1071 tons; *Jamestown*, 1300 tons=2371 tons.

Philadelphia and Savannah.—Two: *Keystone State* and *State of Georgia*, each about 1300 tons=2600 tons.

Boston and Baltimore.—Two: *Joseph Whitney*, 800 tons; Unknown, 800 tons=1600 tons.

New Orleans and Texas.—The *Charles Morgan, Texas, Mexico*, and *Atlantic*, averaging 600 tons each=2400 tons.

New Orleans and Key West.—The *General Rusk*, 600 tons, and the *Calhoun*, 400 tons=1000 tons.

There are also several propellers running: between New York and Charleston, New York and Portland, and between Philadelphia and the South. They are all, however, small, and irregular in their trade.

Steamers lying up, 18. Registered tonnage, 24,845 tons.

STATEMENT SHOWING THE NUMBER OF STEAM VESSELS BUILT IN THE SEVERAL STATES AND TERRITORIES OF THE UNITED STATES FROM 1823 TO 1857, INCLUSIVE.—(YEAR ENDING JUNE 30.)

Years.	Steamers.	Years.	Steamers.
1823	15	1841	78
1824	26	1842	137
1825	35	1843	70
1826	45	1844	163
1827	38	1845	163
1828	33	1846	225
1829	43	1847	198
1830	37	1848	175
1831	34	1849	208
1832	100	1850	179
1833	65	1851	233
1834	68	1852	259
1835	80	1853	271
1836	124	1854	281
1837	135	1855	253
1838	90	1856	221
1839	125	1857	263
1840	64		

From this exhibit it is apparent that, in point of numbers, there has been no increase in the steam-vessels built since the year 1851. If, however, we take into consideration the increased size of the vessels built, or the aggregate tonnage, there has been a healthy increase corresponding to the growth of the country.

STATEMENT SHOWING THE NUMBER OF STEAM VESSELS BUILT IN EACH DISTRICT OF THE UNITED STATES DURING THE YEAR ENDING JUNE 30, 1857.

From the sixth annual report of the board of supervising inspectors of steamers, made to the Secretary of the Treasury, we glean the following interesting statistics:

During the five years from 1848 to 1852, inclusive, prior to the establishment of the Board of Supervisors, there were 50 steamboat explosions, causing a loss of 1155 lives, and 475 persons wounded. By other disasters during the same period, 416 lives were lost, making a total loss of 1571 lives in the five years. During the four years from 1854 to 1857, inclusive, subsequent to the passage of the steamboat law, there have been seven explosions, and 132 lives lost. By other disasters, collisions, fire, sinking, etc., there have been lost during the same time 214 lives, making a total loss for the five years of 346.

By an examination of these statements we find that for five years prior to the passage of the steamboat act we have accounts of the loss of 1571 lives, and for the five years since said passage the total loss of life on the Western rivers is 346, leaving a difference of 1225 lives.

The total number of steamers inspected during the year in the United States was 1122, with an aggregate tonnage of 464,370 tons. The number of pilots is 2584, and number of engineers 2854. The total number of passengers carried by licensed steamers was 3,610,307.

STATEMENT SHOWING THE TONNAGE EMPLOYED IN STEAM NAVIGATION IN THE UNITED STATES FROM THE YEAR 1823 TO THE YEAR 1857, INCLUSIVE.

Years	Tonnage.	Years.	Tonnage.
1823	24,819	1841	175,048

1839	204,038	1857	705,784
1840	201,339		

To show the advantage which steam communication gives to a growing trade, it may be stated that "from 1840 to 1850 the total imports of Great Britain from Brazil made no increase. In 1853 they had advanced 150 per cent. on 1848; and in 1855 they had advanced over 1848—or the average of the ten years noticed—about 300 per cent. This, however, it must be recollected, was in coffee, for re-exportation; a trade which was lost to our merchants and to our shipping. Her total exports to Brazil from 1840 to 1850 were stationary at about two and a half million pounds sterling annually. In 1851—the first year after steam by the Royal Mail Company—they advanced 40 per cent.; and in 1854 they had advanced 102 per cent. on 1850. Thus her exports have doubled in five years, from a stationary point before the establishment of steam mail facilities; whereas ours have been thirteen years in making the same increase. The total trade between Brazil and Great Britain has increased in an unprecedented ratio. The combined British imports and exports up to 1850 averaged £3,645,833 annually; but in 1855 these had reached £8,162,455. Thus *the British trade increased 225 per cent. in five years after the first line of steamers was established to Brazil.*"—*Brazil and the Brazilians.*

The many instances of our dereliction in the establishment of steam mail facilities, and the failure to establish locomotive accommodations for our merchants and other business classes, call loudly for a change in our affairs, and the establishment of a national steam policy in the place of the accidental and irregular support hitherto given to foreign steam enterprise.

The conclusions which Mr. Rainey arrived at in his late work on Ocean Steam Navigation are set forth in a clear summary, which we give as follows:

1. That steam mails upon the ocean control the commerce and diplomacy of the world; that they are essential to our commercial and producing country; that we have not established the ocean mail facilities commensurate with our national ability and the demands of our commerce; and that we to-day are largely dependent on, and tributary to our greatest commercial rival, Great Britain, for the postal facilities which should be purely national, American, and under our own exclusive control.

2. That fast ocean mails are exceedingly desirable for our commerce, our defenses, our diplomacy, the management of our squadrons, our national standing, and that they are demanded by our people at large.

3. That fast steamers alone can furnish rapid transport to the mails; that these steamers can not rely on freights; that sailing vessels will ever carry staple freights at a much lower figure, and sufficiently quickly; that while steam is eminently successful in the coasting trade, it can not possibly be so in the transatlantic freighting business; and that the rapid transit of the mails, and the slower and more deliberate transport of freight, is the law of nature.

4. That high, adequate mail speed is extremely costly, in the prime construction of vessels, their repairs, and their more numerous employes; that the quantity of fuel consumed is enormous, and ruinous to unaided private enterprise; and that this is clearly proven both by theory and indisputable facts, as well as by the concurrent testimony of the ablest writers on ocean steam navigation.

5. That ocean mail steamers can not live on their own receipts; that neither the latest nor the anticipated improvements in steam shipping promise any change in this fact; that self-support is not likely to be attained by increasing the size of steamers; that the propelling power in fast steamers occupies all of the available space not devoted to passengers and express freight; and that steamers must be fast to do successful mail and profitable passenger service.

6. That sailing vessels can not successfully transport the mails; that the propeller can not transport them as rapidly or more cheaply than side-wheel vessels; that with any considerable economy of fuel and other running expenses, it is but little faster than the sailing vessel; that to patronize these slow vessels with the mails, the government would unjustly discriminate against sailing vessels in the transport of freights; that we can not in any sense depend on the vessels of the navy for the transport of the mails; that individual enterprise can not support fast steamers; and that not even American private enterprise can under any conditions furnish a sufficiently rapid steam mail and passenger marine: then it must be conceded,

I. That it is the duty of the government to its people to establish and maintain an extensive, well-organized, and rapid steam mail marine, for the benefit of production, commerce, diplomacy, defenses, the public character, and the general interests of all classes; that our people appreciate the importance of commerce, and are willing to pay for liberal postal facilities; that our trade has greatly suffered for the want of ocean mails; that we have been forced to neglect many profitable branches of industry, and many large fields of effort; and that there is positively no means of gaining and maintaining commercial ascendency except through an ocean steam mail system.

II. That the government can discharge the clear and unquestionable duty of establishing foreign mail facilities only by paying liberal prices for the transport of the mails for a long term of years, by creating and sustaining an ocean postal system, by legislating upon it systematically, and by abandoning our slavish dependence upon Great Britain.

III. That the British ocean mail system attains greater perfection and extent every year; that instead of becoming self-supporting, it costs the treasury more and more every year; that English statesmen regard its benefits as far outweighing the losses to the Treasury; that so far from abandoning, they are regularly and systematically increasing it; that it was never regarded by the whole British public with more favor than at the present time; that it is evidently one of the most enduring institutions of the country; that it necessitates a similar American system; that without it our people are denied the right and privilege of competition; and that we are thus far by no means adequately prepared for that competition, or for our own development.

* Building another steamer of 2500 tons for the Brazil line.
† These vessels average about 250 horse-power each. Their tonnage is large, probably 1200 tons each.

There are several other lines of ocean steamers in Europe; but it is almost impossible to ascertain any thing definite about them. The list above embraces all of the most important companies of the world. The lines are continually changing, while the vessels are passing into new bands almost every week.—*See articles* TONNAGE and the UNITED STATES.

Steel (Fr. *Acier;* Ger. *Stahl;* It. *Acciajo;* Lat. *Chalybs;* Russ. *Stal;* Sp. *Acero;* Swed. *Stål*), is iron combined with a small portion of carbon, and has been for that reason called carbureted iron. The proportion of carbon has not been ascertained with much precision. It is supposed to amount at an average to $\frac{1}{140}$ part. Steel is so hard as to be unmalleable while cold; or at least it acquires that property by being immersed, while ignited, in a cold liquid; for this immersion, though it has no effect upon iron, adds greatly to the hardness of steel. It is brittle, resists the file, cuts glass, affords sparks with flint, and retains the magnetic virtue for any length of time. It loses this hardness by being ignited, and cooled very slowly. It is malleable when red hot, but scarcely so when raised to a white heat. It may be hammered out into much thinner plates than iron. It is more sonorous; and its specific gravity when hammered is greater than that of iron—varying from 7·78 to 7·84. Steel is usually divided into three sorts, according to the method in which it is prepared; as *natural steel*, *steel of cementation*, and *cast steel*. The latter is the most valuable of all, as its texture is the most compact, and it admits of the finest polish. It is used for razors, surgeons' instruments, and similar purposes. Steel is chiefly employed in the manufacture of swords, knives, and cutting instruments of all sorts used in the arts; for which it is peculiarly adapted by its hardness, and the fineness of the edge which may be given to it.—*See* IRON.

Steelyard and Steelyard Company. A most ancient instrument, the same that is translated balance in the Pentateuch. The *Statera Romana*, or Roman steelyard, is mentioned in 515 B.C. The Steelyard Company was a company of London merchants who had the steelyard assigned to them by Henry III. A.D. 1232. They were all Flemings and Germans, and the only exporters, for many years after, of the staple commodities of England.—HAYDN.

Steer, to keep the ship on a given direction. This is done by moving the rudder by the tiller, which last is moved from that side to which the ship's head is required to be moved.

Steerage, an apartment before the great cabin, from which it is separated by a partition or bulk-head. In merchant ships it is generally the habitation of the inferior officers and crew; but in ships of war it serves

only as a hall or ante-chamber to the great or captain's cabin.—*Steerage* is also used to express the effort of the helm.—*Steerage-way* implies a sufficient degree of motion communicated to a ship for her to become susceptible of the effects of the helm in governing her course.

Stem, a circular piece of timber into which the two sides of a ship are united at the fore end; the lower end of it is scarfed to the keel, and the bowsprit rests upon its upper end; the ends of the walls and planks of the sides and bottom are let into a groove or channel cut in the middle of its surface from top to bottom. The outside of the stem is usually marked with a scale of feet answering to a perpendicular from the keel. The use of this scale is to ascertain the draught of water.—*From stem to stern*, from one end of the ship to the other.

Steppe (from the Russian *step*, a desert; also a dry plain). The steppes of Russia, which are not unlike the *landes* of Guienne in France, and the heaths of northern Germany, are in part susceptible of cultivation, and they afford pasturage for the numerous herds of the nomadic tribes. In the extensive steppes of Astrakhan, between the Volga and the Ural, the Calmucs and the Nogay Tartars rove with their cattle. They produce several sorts of flowers, herbs, and are frequented by wild goats and birds.

Sterling, an old pound weight of geographical significance, named Easterling, divided into twelve ounces, was in use among the Anglo-Saxons some centuries before the Norman Conquest. The same weight, called the Tower and the Moneyers' pound, was styled by early French writers the Roman and the Rochelle pound; also known among the Germans as the Cologne pound. A simple system of *exchange*, by which a pound of silver money, in tale, was made to equal a pound in grose weight, had been arranged by Charles the Great, in France, toward the end of the 8th century. In Britain, under the first William of Normandy, an ordinance declared "the weights and measures throughout the kingdom shall remain as our worthy predecessors have established." An act of Henry the Third, in 1266, explains the primitive initials of these ancient British, Gallic, and German standards, to all which one common derivation is imputed. "By consent of the whole realm the measure of the king was made, that is to say, an English penny of silver, called a sterling, round and without any clipping, shall weigh thirty-two wheat corns, taken from the middle of the ear. And twenty pence of silver do make one ounce; and twelve ounces of silver do make one pound; and eight pounds of silver do make a gallon of wine; and eight gallons of wine do make a London bushel, which is the eighth part of a quarter." This general arrangement for money weights and measures was that of the Eastern nations, by which Europe had been overrun. The term "Easterling" of the Norman French was transmuted on the English tongue, first to "Easterling," and finally to "Sterling." Another pound weight, also divided into twelve ounces, had been brought from Cairo, in Egypt, to Troyes of Champagne, in France, during the Crusades. Carried into England by foreign goldsmiths, Lombard merchants, possibly from Venice, about the year 1496, it gradually superseded the old Easterling weights, and found access into the British Mint by decision of Henry the Eighth. Queen Elizabeth ordered the ounce of silver in England to be cut into sixty pennies, so that the penny, forming the twentieth of an ounce, thenceforth became the sixtieth part. From the termination of Queen Elizabeth's reign, the coinage of English silver has generally retained *a purity* of 925 thousandths, called the "Sterling standard."—*See* POUND and PENNY. See also *Bankers' Magazine*, N. Y., 1856, '57.

Stettin, a city of Prussia, on the left bank of the Oder, about 36 miles from its mouth, in lat. 53° 23′ 20″ N., long. 14° 33′ E. It is well built, strongly fortified, and had in 1846 a population of 42,000. Stettin is the seat of an extensive and growing commerce; and is now, indeed, the principal port of importation in Prussia. She owes this distinction mainly to her situation. The Oder, which flows through the centre of the Prussian dominions, is navigable as far as Ratibor, near the extreme southern boundary of Prussian Silesia; and is united, by means of canals, with the Vistula, the Elbe, the Spree, etc. Stettin is, consequently, the principal emporium of some very extensive and flourishing countries; and is not only the port of Frankfort-on-the-Oder, Breslau, etc., but also of Berlin. A railway from the latter to Stettin has been completed. Hence at the proper seasons its wharves are crowded with lighters that bring down the produce of the different countries traversed by the river, and bring back colonial products, and other articles of foreign growth and manufacture. Vessels of considerable burden, or those drawing about seven or eight feet water, load and unload, by means of lighters, at the mouth of the river, at Swinemunde, the outport of Stettin, on the east coast of the isle of Usedom, in lat. 53° 55′ N., long. 14° 15′ 15″ E. Formerly there were not more then seven feet water over the bar adjacent to Swinemunde; but the harbor of the latter has recently been so much improved, by the construction of piers and breakwaters, dredging, etc., that it is now the best on the Prussian coast, and admits vessels drawing from 18 to 19 feet water. A light-house has been erected at the extremity of the eastern pier. Stettin is a free port; that is, a port into and from which all sorts of goods may be imported and re-exported free of duty. Goods brought through the Sound and imported at Stettin, and entered for home consumption in the Prussian states, were formerly charged with 2½ per cent. less duty than if they had been imported through any other channel. This was intended to reimburse the merchant for the Sound duties, and to encourage importation by this direct route in preference to that carried on through Hamburg and Embden; but now that the Sound dues are abolished there no longer exists the necessity for the bounty. There is at Stettin a great wool fair in the month of June each year.

The intercourse with the United States is solely dependent on the regulations of the Zoll-Verein. There are no privileges in favor of any nation which are denied to the United States, nor any restrictions imposed upon the commerce of any other nations. The moneys, weights, and measures, etc., etc., in the ports of this consular district are the same as established by the law of the mother country. Commission, 2 per cent. Freight—no rates can be named for want of business. Insurance done in England or the United States. Bills at three months. There are no direct exchanges with the United States.

Steward, in *Naval affairs*, is an officer in a ship of war, appointed by the purser to distribute the different species of provisions to the officers and crew. The same officer is employed for steamships and all classes of vessels for similar purposes.

Stockholm, the capital city of Sweden, situated at the junction of the Lake Maelar with an inlet of the Baltic, in lat. 59° 20′ 31″ N., long. 17° 54′ E.; a well-built, handsome city. Population in 1851, 93,070. The entrance to the harbor is intricate and dangerous, and should not be attempted without a pilot; but the harbor itself is capacious and excellent, the largest vessels lying in safety close to the quays. Stockholm possesses from a third to a half of the foreign trade of Sweden; but this is confined within comparatively narrow limits. The government has long been accustomed to endeavor to promote industry by excluding foreign products; latterly, however, this system has been considerably relaxed, with great advantage to the trade of the country, and the well-being of the people. Iron, timber, and deals form the great articles of export. Swedish iron is of very superior quality, and is

rather extensively used in Great Britain; the imports of it amounting in ordinary years to about 16,000 tons exclusive of 600 tons of steel. In addition to the above leading articles, Stockholm exports pitch, tar, copper, etc. The timber is inferior to that from the southern ports of the Baltic. The imports principally consist of colonial products, cotton, dye-stuffs, salt, British manufactured goods, hides, fish, wine, brandy, wool, fruit, etc. In seasons of scarcity corn is imported, but it is generally an article of export.

Pilotage.—Vessels bound for Stockholm take a pilot at the small island of Oja. Lands-hort light-house is erected on the southern extremity of this island, in lat. 58° 44′ 30″ N., long. 17° 52′ 15″ E. It is painted white, and is furnished with a fixed light, elevated 158 feet above the level of the sea, which may be seen under favorable circumstances five leagues off. The signal for a pilot is a flag at the fore top-mast head, or firing a gun.

The following table exhibits the commercial movements at the port of Stockholm during the year 1851, compared with the two preceding years:

Years.	Vessels entered	Tonnage.	Vessels cleared	Tonnage.	Total Vessels.	Total Tonnage
1849	669	70,728	790	79,118	1459	149,846
1850	711	71,892	783	77,478	1494	149,370
1851	851	94,218	905	95,236	1756	189,454

The following table shows the countries from which the vessels comprised in the foregoing table for 1851 cleared, and to which they sailed:

Countries.	No. of Vessels.	Tonnage.
Finland	572	44,528
Great Britain	191	36,714
Russia	178	19,790
Prussia	165	12,122
France	72	11,634
Portugal	59	10,712
Denmark	150	9,016
Hanse Towns	126	8,434
Norway	93	8,414
Brazil	27	6,526
United States	17	5,016

The following comparative table shows the values of imports and exports into and from the port of Stockholm during the years designated:

Years.	Imports. Francs.	Exports. Francs.	Total Trade. Francs
1849	21,578,000	17,342,000	38,920,000
1850	20,464,000	14,054,000	34,516, 00
1851	23,809,000	14,014,000	37,823,000

VALUE AND DESCRIPTION OF MERCHANDISE IMPORTED INTO, AND EXPORTED FROM, THE PORT OF STOCKHOLM IN 1851.

IMPORTS.

Articles.	Francs.
Cereals	3,221,000
Sugar	3,481,000
Coffee	1,759,000
Fish	7,303,000
Wines and spirits	1,173,000
Tallow	1,223,000
Raw silk	1,019,000
Tissues	2,145,000

EXPORTS.

Iron and steel	10,450,000
Copper	1,824,000
Pitch and tar	311,000
Timber and lumber	187,000

The following table exhibits the countries which participated in the general commercial movements of 1851, and the value of imports and exports assigned to each:

Year 1851. Countries.	Imports. Francs.	Exports. Francs.	Total. Francs.
Norway	1,097,000	31,000	1,128,000
Denmark	875,000	1,538,000	2,413,000
Russia	2,023,000	243,000	3,166,000
Finland	1,037,000	1,211,000	2,248,000
Prussia	960,000	2,374,000	3,334,000
Hanse Towns	6,306,000	1,307,000	7,613,000
Great Britain	2,260,000	2,897,000	5,157,000
Netherlands	586,000	281,000	867,000
France	785,000	747,000	1,532,000
Portugal	431,000	707,000	1,138,000
Brazil	4,026,000	299,000	4,325,000
United States	302,000	1,306,000	1,608,000
East Indies	1,431,000	199,000	1,631 000

Besides the countries included in the preceding table, Stockholm extends its commercial transactions to Spain, Italy, Austria, Malta and Gibraltar, Mecklenburg, Hanover, Oldenburg, Belgium, the Cape of Good Hope, and the Antilles.

It may be remarked that during this year the general commerce of Sweden exhibited an advancing tendency. This was owing, in a great measure, to the liberal policy which characterized the commercial legislation of England, dating from January 1, 1850—a policy the wisdom of which could not be more appositely illustrated than by the fact that while the total trade of Sweden with all foreign nations during this year reached as high as 55,000,000 rix dalers,* the trade with England alone covered 14,543,000 rix dalers, or more than one-fourth of the whole.

In 1852 official returns show a slight falling off in the general trade of Stockholm. It will be seen from the annexed table, from Swedish official sources, that the entire trade, imports and exports united, represents in value $6,559,027, or about $487,070 less than the total trade of 1851. This diminution affected imports, especially grains, fish, and brandies, to the extent of 1,523,494 francs, while coffee and sugar increased in value 838,816 francs; and in the export trade it was felt in the falling off the preceding year of 1,014,770 francs, chiefly on iron, steel, and copper, while the exportation of timber and pitch increased over that of 1851. In 1852 a new article of commerce entered into the export trade of Sweden. The metal *nickel* figures for the first time in the returns for this year to the amount of 101,520 francs, or $18,88272, chiefly sent to the Hanse Towns. The navigation of the port of Stockholm during 1852 presented a total tonnage of 167,686 tons: viz., entered, 81,874 tons; cleared, 85,812 tons. This is a falling off from 1851 of 21,768 tons.

Exports.—It is unnecessary to present a detailed statement of exports, inasmuch as iron, steel, and copper constitute the articles of chief value exported from the port of Stockholm. Other exports consist principally of timber (boards), pitch, and tar. These amounted in value, in 1852, to $107,533, to which is to be added for miscellaneous, not enumerated, $230,048. The total value of iron, steel, and copper exported in 1852 was: iron and steel, $1,747,515; copper, $327,213. Value of iron and steel exported from Stockholm to the United States in 1852, $8102. Great Britain, the Hanse Towns, and Denmark occupy the first rank in the order in which they are given as exporters from Stockholm. Prussia, Finland, Portugal, France, and the United States come next.

STATEMENT EXHIBITING THE GENERAL FOREIGN TRADE OF STOCKHOLM, SHOWING THE QUANTITIES AND VALUES OF IMPORTS AND EXPORTS, RESPECTIVELY, DURING THE YEAR 1853.

IMPORTS.

Description of Merchandise.	Value in Francs.
Coffee	2,901,000
Sugar	2,419,000
Cereals	1,760,000
Fish	1,040,000
Wines and spirits	888,000
Tallow	1,189,000
Tissues	1,853,000
Raw silk	892,000

EXPORTS.

Iron and steel	10,403,000
Copper	1,849,000
Wood and lumber	241,000
Pitch and tar	314,000

During the year 1853 there was a great scarcity of vessels to carry off the freight to foreign markets. The number that entered the port of Stockholm was 589, with an aggregate of 76,226 tons; and the number cleared was 927, with an aggregate of 81,916 tons. The total number entered and cleared was 1516 vessels; aggregate tonnage, 158,142 tons. The number of vessels was greater, but the tonnage was less by 9500 tons than in 1852.

* The rix daler is equivalent to 89½ cents.

Money.—Accounts are kept here, in Gottenburg, and generally throughout Sweden, in paper money, consisting of rix dollars *banco*, one rix dollar being equal to 48 skillings, and one skilling to 12 rundstycks. The exchange with London is at about 12 rix dollars banco per £, so that the rix dollar is worth about 1*s.* 8*d.* sterling. Rix dollars banco may be exchanged for specie rix dollars at the rate of 2¾ the former for one of the latter. But there are very few coins, except of copper, in circulation, the currency consisting almost wholly of notes varying from 5 skillings to 500 rix dollars banco.

Weights and Measures.—The victuali or commercial weights are punds, lippunds, and skippunds; 20 punds being equal to 1 lispund, and 20 lispunds=1 skippund. 100 lbs. Swedish commercial weight=93¾ lbs. avoirdupois=42½ kilograms=87¾ lbs. of Hamburg.

The iron weights are three-fifths of the victuali, or commercial weights; 20 marks=1 mark pund; 20 mark punds=1 mark skippund; and 7½ skippunds=1 ton English. Hence 100 punds Swedish iron weight=75 lbs. avoirdupois, and 100 lbs. avoirdupois=133⅓ lbs. Swedish iron weight.

In corn measure, 4 quarts=1 spann; 2 spann=1 tun, or barrel; 1 tun=1⅕ Winchester bushels; a last of rye from Riga=18 tuns; a last of rye from Liebau =19½ tuns; a last of rye from Stettin=22½ tuns; a last of rye from Stralsund=24 tuns. The tun of 32 kappor contains 4½ Winchester bushels.

In liquid measure, 2 stup=1 kanna; 15 kannor=1 anker; 2 ankers=1 eimer; 2 eimers=1 ahm; 1½ ahm =1 oxhoft; 2 oxhoft=1 pipe. The pipe=124¼ English wine gallons; and, consequently, the ahm=41$\frac{5}{12}$ English wine gallons, and 100 kannor=69⅓ English gallons.

The Swedish foot=11·684 English inches; the ell, or alna,=2 feet; the fathom=3 ells; the rod=8 ells.

In estimating by lasts, 1 last of pitch, ashes, etc.,= 12 barrels; 1 last of tar, oil, etc.,=13 barrels; 1 last of hemp, flax, tallow, etc.,=6 skippunds; 1 ton of Liverpool common salt=7 tons Swedish.

Port Charges at Stockholm.—The total port charges for a vessel of 500 tons (250 lasts) amount to about $277, including all expenses, in and out. For an unprivileged vessel this amount is nearly doubled.

Port Charges at Gothenburg.—Tonnage, pilotage, and all other dues and port charges on a vessel of 300 tons, amount at this port to about $167.—*Com. Relat. U. S.*

Stockings, as every one knows, are coverings for the legs. They are formed of only one thread entwined, so as to form a species of tissue, extremely elastic, and readily adapting itself to the figure of the part it is employed to cover. This tissue can not be called cloth, for it has neither warp nor woof, but it approaches closely to it; and for the purpose to which it is applied it is very superior. Silk stockings were first worn by Henry II. of France, in 1547. In 1560 Queen Elizabeth was presented with a pair of black silk stockings by her silk-woman, Mrs. Montague, and she never wore cloth ones any more.—Howell. He adds, "Henry VIII. wore ordinary cloth hose, except there came from Spain by great chance a pair of silk stockings; for Spain very early abounded with silk." Edward VI. was presented with a pair of Spanish silk stockings by his merchant, Sir Thomas Gresham; and the present was then much taken notice of.—Howell. Others relate that William Rider, a London apprentice, seeing at the house of an Italian merchant a pair of knit worsted stockings from Mantua, ingeniously made a pair like them, which he presented to the Earl of Pembroke, the first of the kind made in England, in 1561.

It is well known that the Romans and other ancient nations had no particular clothing for the legs. During the Middle Ages, however, hose or *leggins*, made of cloth, began to be used; and at a later period the art of knitting stockings was discovered. Unluckily, nothing certain is known as to the individual by whom, the place where, or when this invention was made.

It would appear from this circumstantial account that the art of knitting stockings, or at least that the first specimens of knit stockings, had been introduced into England from Spain about the middle of the 16th century; and such seems to have been the general opinion, till an allusion to the practice of knitting, in the pretended poems of Rowley, forged by Chatterton, made the subject be more carefully investigated. The result of this investigation showed clearly that the practice of knitting was well known in England, and had been referred to in acts of Parliament a good many years previously to the period mentioned by Howell. But it had then, most probably, been applied only to the manufacture of woolen stockings; and the general use of cloth hose shows that even these had not been numerous. There is no evidence to show whether the art is native to England or has been imported.—*See* Beckmann's *Inventions, article* Stockings.

It is singular that the stocking-frame, which, even in its rudest form, is a very complex and ingenious machine, that could not have been discovered accidentally, but must have been the result of deep combination and profound sagacity, should have been discovered so early as 1589—before, in fact, the business of knitting was generally introduced. The inventor of this admirable machine was Mr. William Lee, of Woodborough, in Nottinghamshire. He attempted to set up an establishment at Calverton, near Nottingham, for the manufacture of stockings, but met with no success. In this situation he applied to the queen for assistance; but, instead of meeting with that remuneration to which his genius and inventions so well entitled him, he was discouraged and discountenanced! It need not, therefore, excite surprise that Lee accepted the invitation of Henry IV. of France, who, having heard of the invention, promised him a magnificent reward if he would carry it to France. Henry kept his word, and Lee introduced the stocking-frame at Rouen with distinguished success; but after the assassination of the king, the concern got into difficulties, and Lee died in poverty at Paris. A knowledge of the machine was brought back from France to England by some of the workmen who had emigrated with Lee, and who established themselves in Nottinghamshire, which still continues to be the principal seat of the manufacture.—*See* Beckmann's *Inventions*, vol. iv.; and *Letters on the Utility and Policy of Machines*, London, 1780.

Imports of Hosiery and Articles made on Frames into the United States for the Year ending June 30, 1857.

Whence Imported.	Cotton Hosiery.	Silk Hosiery.	Woolen Hosiery.
Hamburg.....	$364,091	$23,024	$37,155

Stock-jobber. It was about the year 1688 that the word stock-jobber was first heard in London. In the short space of four years a crowd of companies, every one of which held out to subscribers the hope of immense gains, sprang into existence; the Insurance Company, the Paper Company, the Lute-string Company, the Pearl-fishery Company, the Glass-bottle Company, the Alum Company, the Blythe Coal Company, the Sword-blade Company. There was a Tapestry Company, which would soon furnish pretty hangings for all the parlors of the middle class, and for all the bed-chambers of the higher. There was a Copper Company, which proposed to explore the mines of England, and held out a hope that they would prove not less valuable than those of Potosi. There was a Diving Company, which undertook to bring up precious effects from shipwrecked vessels, and which announced that it had laid in a stock of wonderful machines resembling complete suits of armor. In front of the helmet was a huge glass eye like that of a cyclop; and

out of the crest went a pipe through which the air was to be admitted.

The process was exhibited on the Thames. Fine gentlemen and fine ladies were invited to the show, were hospitably regaled, and were delighted by seeing the divers in their panoply descend into the river and return laden with old iron and ships' tackle. There was a Greenland Fishing Company, which could not fail to drive the Dutch whalers and herring busses out of the Northern Ocean. There was a Tanning Company, which promised to furnish leather superior to the best that was brought from Turkey or Russia. There was a society which undertook the office of giving gentlemen a liberal education on low terms, and which assumed the sounding name of the Royal Academies Company. In a pompous advertisement it was announced that the Directors of the Royal Academies Company had engaged the best masters in every branch of knowledge, and were about to issue twenty thousand tickets at twenty shillings each.

There was to be a lottery; two thousand prizes were to be drawn; and the fortunate holders of the prize were to be taught, at the charge of the Company, Latin, Greek, Hebrew, French, Spanish, conic sections, trigonometry, heraldry, japanning, fortification, bookkeeping, and the art of playing on the theorobo. Some of these companies took large mansions, and printed their advertisements in gilded letters. Others, less ostentatious, were content with ink, and met at coffeehouses in the neighborhood of the Royal Exchange. Jonathan's and Garraway's were in a constant ferment with brokers, buyers, sellers, meetings of directors, meetings of proprietors. Time-bargains soon came into fashion. Extensive combinations were formed, and monstrous fables were circulated, for the purpose of raising or depressing the price of shares.—MACAULAY.

Stocks. The public funding system originated in Venice in the 12th century, and was introduced into Florence in the year 1340. The English funding system may be said to have had its rise in 1672–'94. In the United States the term *stocks* includes United States funded loans and State loans, and the stocks or shares in various corporations, such as railroad companies, banks, funded debts of cities, etc.

In England the term *stocks* is applied mainly to government funded debt—such as consols, Bank of England stock, etc.; and the term *shares* is used when applied to the capital or joint stock of railroad, banking, and mining companies.—*See article* FUNDS.

The difficulties in which individuals are involved by their real wants, but oftener by their unruly passions, are the source of their debts. The debts of [European] nations have not a different origin. When the ordinary resources of a country were insufficient to carry into effect the private views or *impolitic wars* of the despots who ruled, or the ministers who directed it, they simply resorted to the expedient of borrowing; but when the sums loaned were inadequate to the increased expenditure, they had recourse to all sorts of *schemes, deceptions,* and *contrivances,* the better to delude the lenders, and allure their avarice. Such is the origin of the British funding system. Among states, debt may be considered a national disease; and, like other diseases in our day, has made the tour of Europe, and, we may add, of many of the new nations of America.

One set of British writers maintain that "debt and wealth are synonymous;" that "increase of debt is a [illegible] of riches;" that no happiness can exist without a national debt. The domestic [*i.e.*, the national] debt, says one of the highest authorities (Colquhoun), "*supposes* protection and *happiness*, by forming a real advantage to the rich over the poor. It has added to the capital increase of public and private buildings, and to the trade, commerce, and navigation of the country." Another, more audacious than the last, declares that "a part of the industry, a part of the [illegible], a part of the land, *belong* to the stockholders; and that by thirty millions of expenditure being in the hands of the stockholders or *dissipators*, consumption is highly stimulated." The extinction of the national debt of Great Britain, in the opinion of these economical writers, would, of course, bring misfortune and evil. "It would," says Colquhoun, "be attended with greater inconveniences than at present are experienced."

Another class of British writers, with more truth, with greater force of argument, and with more evidence of facts, contend that "poverty, misery, and the national debt, are also synonymous and identical terms;" that "taxation incurred to pay its annual interest (swallowing up thirty millions out of sixty millions of revenue, to satisfy the fund-holders), oppresses the people, destroys industry, and is equal to the curse of heaven on the agriculture, commerce, and manufactures of the nation." (McCulloch): "To maintain that this enormous taxation enriches the nation, because it abstracts a portion of its riches, is both a plain contradiction and an absurdity; taxation being always an engine of destruction to all the productive classes." "To attribute to the debt the increase of business, improvements, etc., during the late war, is an error of the most miserable kind. It is to be attributed not to the increase of debt, but to the monopoly of commerce, to the discoveries of Arkwright and Watt, and to various other causes. The nation did not improve because of the debt, but in spite of it; as it gave birth to the nefarious practice of stock-jobbing, begetting a spirit of gambling, destructive of public morals, disgraceful to the nation, and hostile to the pursuit of sober industry." "No wages, no part of the lands, belongs to the stockholders or *dissipators*; nor was any specified property pledged for the greatest part of the debt contracted. The lenders had not at the time any property mortgaged to them; consequently, they can not have at present more specified rights than they possessed when they loaned their money. To maintain the contrary is a dangerous and arbitrary assumption." "They advanced money when its value was depreciated on an average of *fifteen per cent.* They never entertained the idea of receiving payment at par, when the loans were contracted at exceedingly low prices." "It would be both folly and injustice to compel the nation to pay one hundred ounces of gold to the fund-holders, when they loaned less than eighty." "It is equally unjust to exempt this sort of property from the alteration in value to which every other kind of property in the kingdom is subject; and, consequently, the reduction of the debt—that millstone which destroys the industry and vigor of the people, *doubles* taxes, and spreads pauperism, crime, and wretchedness throughout the country—*can* be effected without any violation of the public faith." "The nation must not suffer on account of the errors of party or ministerial men. The happiness of twenty-four millions of British subjects ought not to be postponed for the sake of an insignificant portion—two hundred and eighty thousand stockholders."

Before we enter more fully on the subject, we have thus drawn a brief summary of the leading arguments and opinions of the contending parties for and against the existence of the present British national debt. It is not difficult to anticipate the American side of the argument; but on the opposite side what can we expect, where the infection of gambling is so strong that Pope, who knew his countrymen well, declared—

> "*Statesman* and *patriot* ply alike *the stocks;*
> *Peeress* and butter share alike the box;
> And *judges* job, and *bishops* bite the town,
> And *mighty dukes* pack cards for half a crown."

In the 12th century, Richard I. pawned the revenues of the crown for the payment of moneys borrowed to defray the expenses of the fanatical conquest of the Holy Land. Henry III. pawned the crown jewels and regal ornaments and robes of state. Edward I. borrowed money to pay the debts of his father, in order

to get his soul "out of purgatory," as the record states. Richard II. was deposed for extorting £1,100,000 sterling, under pretext of borrowing, which was never repaid. This was one of the chief causes of the York and Lancaster wars. In 1846, Edward III. ordered a sum of money to be lent to him. Henry IV. *obliged* the rich men of the kingdom to lend him money upon the growing taxes. Henry VIII. escaped the punishment he so justly merited for defrauding his creditors. He compelled Parliament to pass two acts, offering him "all the money he had received in loans;" thus discharging him of all obligations he had come under, and all suits that might arise thereupon. In money matters in Elizabeth's time, the people insisted upon the payment of the sums advanced to her predecessors —a demand she was wise enough to comply with. Burleigh counseled her to lay the foundation of public credit. The commonwealth contracted a large debt: at Cromwell's death it amounted to £2,474,290. Charles, by closing the exchequer in 1672, *defrauded* the creditors of the state of the sum of £2,800,000; but an arrangement took place, by which the sum of £664,226 was left at an interest of £19,027 18*s.* 6*d.* *This was the origin of the present national debt, and its whole amount before the English Revolution.*

In former times, says a British writer, loans were generally contracted for short periods. It was, moreover, an established practice that the funds assigned for the repayment should be sufficient to pay the principal and interest, and that within a certain number of years. The British system, in practice, is quite the reverse. Their ministers are satisfied if they provide for the payment of the interest, without a thought on providing for the discharge of the principal; or if they do, it is in conformity to the maxim of Linguet and Terney, "to cancel the capital by a general bankruptcy, in order to bring the state home." This maxim of Terney and Linguet was practically adopted in France some centuries ago. Brisson, in his history, enumerates FIVE national bankruptcies; but in the financial history of that country may be found a great many more. The new system originated in the republics of Venice and Genoa; and being imported by William III., has been carried by the British to the highest perfection.

After the Irish Revolution, to supply deficiencies, William had recourse to the *long annuities* which were created in 1692. £881,493 were raised on annuities of 99 years, bearing interest at 10 per cent. until 1700, and at 7 per cent. after that year, with benefit of survivorship for the lives of the nominees of those who contributed. The *short annuities* began in 1693. Eight millions was borrowed by this expedient; every subscriber receiving 14 per cent. for sixteen years, besides a lottery ticket. At this moment the scheme of the Bank of England was contrived by Patterson. The bank loaned William £1,200,000, at 8 per cent. interest; thus at the very outset taking advantage of the public distress, and setting a usurious example to their successors, who, like true Shylocks, have ever since profited by the example. Chancellor Montague about this period, to aid his sovereign, invented the scheme of issuing exchequer bills. Their issue has been at intervals ever since. The most exorbitant premiums were given for money, and the public debt was greatly increased. Public credit sunk so low, that out of five millions granted to carry on a war only two and a half, in Davenant's opinion, ever reached the exchequer. One of the constituent parts of *the funding system* is the reduction of interest from the higher to the lower denomination. This expedient, which has played so conspicuous a part in our day, was originally resorted to in 1699, when the higher interests were reduced to 5 per cent. It was the destiny of King William's reign to create, improve, and to complete *all the essential parts of the funding system* as in practice at this day. William left a national debt at the close of his reign of £16,894,702. This sum formed the nucleus of the present national debt. (These facts are chiefly collected from British parliamentary history.)

The history of the Stock Exchange a century ago is its history at the present day. "The centre of jobbing," says a writer of that time, "is the kingdom of 'Change Alley." The enormous profits made by the association, the malpractices of the greater part of its members, and the insolence of the richer ones, excited the just alarm of a steady and reflecting nation unaccustomed to such manœuvres, and the public writers began to attack their increasing power. "The villainy of stock-jobbing is called a mystery or machine of trade," says one of these writers. "This destructive hydra, this new corporation of hell," exclaims another; while one of them gives directions, in order to besiege and bring to surrender "that infamous place, 'Change Alley," "to storm it," etc. Another writer declares that "the general cry against stock-jobbing has been so long, and it has been so justly complained of as a public nuisance, that these people are hardened in crime; all their art is a mere system of cheat and delusion; their characters are as dirty as their employments; and the best thing that can be said of them is, that there *happen* to be two honest men among them." "Their employment becomes a crime. This set of men are more dangerous than all national enemies abroad." "Exchange Alley is, in fact, as dangerous to the public safety as a magazine of gunpowder to a populous city."

However, all these invectives did not obstruct the progress of the establishment; on the contrary, it became more powerful, and increased in proportion as the government was more extravagant and careless of the public money. It became, in short, an indispensable engine of the government itself; but the latter was compelled, by public opinion against the detested operations of the Exchange, and in order to keep up appearances, to pass several acts against the very operations and the very gambling it was so deeply, though secretly, fomenting. Avarice, idleness, and the hope of becoming rich in a short time without industry, eluded and evaded all the laws of British wisdom, and sometimes disregarded even the common law of the land. By a variety of measures has the power of this corporation reached its present height. Its members have not only become the exclusive masters of the British money market, but have acquired the immense power of secretly controlling and regulating the funds and money market of all Europe, and, we may add, all America. No financial operation whatever can be safely undertaken in any of those markets without consulting and obtaining the approbation of the Committee of the Stock Exchange. The agents of the Bank of England have surpassed their principals. A mere decision of a committee, composed of individuals unknown beyond their own immediate circle, is more powerful, and will produce more effect in regard to any loan or financial measure than all the laws of the sovereigns of Europe put together. However, the importance of the Stock Exchange has somewhat declined since the failure of its gigantic operations on this side of the Atlantic; and since the immense losses sustained by the British public on that occasion, it has been less attended; the number of its members being reduced at one time as low as 400.

Funding System.—The first operation of the funding system, after the peace of 1815, in consequence of the rise of public securities, was to reduce the interest on exchequer bills (1817) from 5¼ to 3½ per cent.; and while only three millions were added to the debt, above twenty-three millions were canceled. The interest of a portion of the public funds was transferred from a lower to a higher denomination; the 3 per cent. stock was converted into 3½ per cent., thereby effecting a reduction of the debt, by inducing the holders of the former stock to buy in the latter at a higher price. Thus the small sum of £3000 was created, while more

than nineteen millions of the national debt were redeemed in 1818. The next measure was the reduction of the five per cents into fours. The bank at that time had thirteen millions in their vaults; and they increased the circulation by throwing a large amount of paper into market, and by lowering the rate of interest from 5 to 4 per cent. By the union of government and banking powers, the enormous sum of £140,250,828 of 5 per cents was readily converted into £147,263,328 of 4 per cents, at an annual saving of interest of £1,222,000 at a small increase of capital only. In 1824, 4 per cents to the amount of £76,806,882 were changed into an equal amount of stock bearing an interest of 3½ per cent. This operation, besides effecting an annual saving of £381,034, had the advantage of making no addition to the capital of the debt. In 1827, £8,500,000 of debt were created, while £2,866,528 were redeemed. In 1828 the sinking fund was destroyed. On the 11th of July, it was enacted that for the future "the amount of the sinking fund be the actual surplus of the revenue over the expenditures." (Came into operation 5th July, 1829.) At that time there were no surpluses, but a large deficiency of revenue.

But although one of the three elements of the funding system was thus lost, the action of that system was not on that account discontinued. A prospective operation was contrived in May, 1830, to transfer into 3½ per cents the fours created at the reduction of the fives in 1822. One of the conditions was, that the new stock should not be subject to redemption at any time before January 5, 1849; and an option was offered to the holders to receive £70 of the new fives, or £100 of the 3½ per cents, for every £100 of 4 per cent annuities. This operation was called prospective, because the advantage of the plan is, that when the stipulated term shall have expired so much relief may be obtained by the nation from every payment of £70 employed in canceling 5 per cents as by the payment of £100 when applied to the discharge of 3½ per cents, both being redeemable at par: annual saving of this step, £700,000. In 1829, £4,900,000 were created, and £6,000,000 reduced; £154,000,000 were created in 1830, and £168,000,000 reduced; but what was the result? The committee of 1828 state, that "in a few years [says the 4th report] which preceded the virtual abandonment of the system, one hundred and twenty millions had been *added* to the capital of the national debt, while the purchases of the commissioners had fallen so far short of that sum that the unredeemed capital of the unfunded debt was *greater* at the commencement of 1823 than it had been in 1818, by the sum of twenty-five millions." In 1819 twelve millions, and in 1820 thirteen millions, were unwarrantably taken from the sinking fund. The actual reduction during the peace is, according to the Finance Committee, who declare "that the total reduction effected from 1816 to 1828 in the national debt was *only three millions and a half.*"

The writer from whom we have abridged the preceding facts concludes: "It appears that this enormous debt (which he states at eight hundred and sixty-four millions) has been chiefly raised by means of the Bank and the Stock Exchange, aided by *the delusion of the sinking fund;* and that it has been principally expended in wars, most of them undertaken against the true interests of the nation, whose topographical situation renders her independent of continental broils and quarrels. Its amount has been immensely increased in time of war, while the reductions effected in time of peace have been exceedingly limited. In the first period, of twelve years peace, ten millions were reduced; in the second, which lasted ten years, only four and a half millions; and in the last and longest, near thirty years, the amount of reduction has been so trifling that it seems almost incredible. When we consider the very inconsiderable reduction effected during so long an interval of peace, the most alarming forebodings arise for the future. The British Legislature, the economists, and the reflecting men so numerous in England, have in this subject an unbounded field for the most serious reflection." These wars were conducted through the agency of *paper money* and the funding system. Pope has very happily hit *the expedients* of the British ministry in the following lines:

> "Bless'd paper credit! last and best supply,
> That lends corruption lighter wings to fly;
> Gold imp'd by thee can compass hardest things,
> Can pocket states—can fetch or carry kings;
> A *single leaf* shall waft *an army* o'er,
> Or ship off senates to some distant shore."

—Compiled from Hamilton, Bailey, Febrer, Parliamentary authorities, and on the authority of manuscript tables obtained from the office of the British Controller in London.

Stoppage in Transitu is the seizure by the seller of goods sold on credit, during the course of their passage (transitus) to the buyer. This principle is said to have been established about 1690 in the Court of Chancery (2 Vern, 203); and it has since been acknowledged in the courts of common law. The transitus is defined to be the passage of the goods to the place agreed upon by the buyer and seller, or the place at which they are to come into the possession of the buyer. This definition does not mean that the term transitus implies continual motion; goods are in transitu while they are at rest, if they are still on the road to the place to which they have been sent. This doctrine of stoppage in transitu entitles a seller, in case of the insolvency or bankruptcy of the buyer, to stop the goods before they come into the buyer's possession. The right of stoppage in transitu is not confined to cases of buying and selling. A factor either at home or abroad, if he consigns goods to his principal by the order of the principal, and has got the goods in his own name or on his own credit, has the same right of stoppage in transitu as if he were the seller of the goods. Questions of stoppage in transitu sometimes involve difficult points of law. The right of stoppage implies that the goods are in the possession of the seller or factor when he exercises this right. Accordingly, the law of stoppage involves the law of possession of movable things. —Bohn's *Cyclopedia;* Abbott *on Shipping;* Cross *on Lien and Stoppage in Transitus;* Smith's *Leading Cases;* Russell's *Treatise on the Laws relating to Factors and Brokers.*

If the buyer has in good faith and for value sold the goods, and indorsed and delivered the bill of lading, this second purchaser holds the goods free from the first seller's right to stop them. But if the goods and bill are transferred only as a security for a debt due from the first purchaser to the transferee, the original seller may stop the goods, and hold them subject to this security, and need pay only the specific advances made on their credit or on that very bill of lading, and not a general indebtedness of the first purchaser to the second. The question has been much agitated whether the right of stoppage in transitu was a right to rescind the sale for non-payment, or only an extension of the common-law lien of the buyer on the thing sold for his price. And it seems now quite well settled, both in England and in this country, that it is the latter; that is, an extension of the lien. Important consequences might flow from this distinction. If the seller, by stopping the goods in transitu, rescinds the sale, he has no further claim for the price, nor any part of it; nor can the buyer, or any one representing him, pay the price and recover the goods against the will of the seller. If, however, he only exercises his right of lien, he holds the goods as the *property* of the buyer; and they may be redeemed by him or his representatives by paying the price for which they are a security; and if not redeemed, they become absolutely the seller's, in the same way as a pledge might become his; and if he fails

to obtain from them the full price due, he has a claim for the balance upon the buyer. All of this is not positively determined by adjudication, but it would seem to be deducible from the principle that the act of stoppage in transitu is only the exercise of a lien on the goods for their price.—PARSONS's *Mercantile Law*, p. 63; *see also* KENT's *Comm.*, vol. ii.

Storax. *See* BALSAM.

Stores, Military and Naval, include arms, ammunition, etc.—*See* NAVAL STORES.

Stores, in *Commercial navigation*, the supplies of different articles provided for the subsistence and accommodation of the ship's crew and passengers.

Stranding, in *Navigation*, the running of a ship on shore, or on the beach.

It is important to define accurately what shall be deemed a stranding. But this is no easy matter; and much diversity of opinion has been entertained with respect to it. It would, however, appear that merely striking against a rock, bank, or shore, is not a stranding; and that, to constitute it, the ship must be upon the rock, etc., for some time (how long?). Mr. Justice Park has the following observations on this subject: "It is not every touching or striking upon a fixed body in the sea or river that will constitute a stranding. Thus Lord Ellenborough held that, in order to establish a stranding, the ship must be *stationary;* for that merely striking on a rock, and *remaining there a short time* (as in the case then at the bar, about a minute and a half), and then passing on, though the vessel may have received some injury, is not a stranding. Lord Ellenborough's language is important. *Ex vi termini* stranding means lying on the shore, or something analogous to that. To use a vulgar phrase, which has been applied to this subject, if it be *touch and go* with the ship, there is no stranding. It can not be enough that the ship lie for a few moments on her beam ends. Every striking must necessarily produce a retardation of the ship's motion. If by the force of the elements she is run aground, and becomes stationary, it is immaterial whether this be on piles, on the muddy bank of a river, or on rocks on the seashore; but a mere *striking* will not do, *wherever* that may happen. I can not look to the consequences without considering the *causa causans*. There has been a curiosity in the cases about stranding not creditable to the law. A little common sense may dispose of them more satisfactorily."

This is the clearest and most satisfactory statement we have met with on this subject; still, however, it is very vague. Lord Ellenborough and Mr. Justice Park hold that, to constitute a stranding, the ship must be *stationary;* but they also hold that if she merely remain upon a rock, etc., for a *short time*, she is not to be considered as having been stationary. Hence every thing turns upon what shall be considered as a short time. And we can not help thinking that it would be better, in order to put to rest all doubts upon the subject, to decide either that every striking against a rock, the shore, etc., by which damage is done to the ship, should be considered a stranding; or that no striking against a rock, etc., should be considered as such, provided the ship be got off within a *specified time*. Perhaps a *tide* would be the most proper period that could be fixed. The English insurance companies exclude the words, "*or the ship be stranded*," from the memorandum.—*See* INSURANCE [MARINE], ABANDONMENT, and AVERAGE.

If the ship be voluntarily stranded, to escape danger from tempest or chase of an enemy, the damages from that act are to be borne by a general average, if the ship be afterward recovered and perform her voyage. But if the ship be wholly lost or destroyed by the act of running her ashore, it has been a question much discussed, and different opinions maintained, whether the cargo saved was bound to contribute to bear the loss of the ship. In the United States the general conclusion seems to be that the loss is not to be borne by general average of cargo; while the decisions in Europe go to establish the opposite.—KENT's *Comm.*, vol. iii. p. 306. It is understood that the mere stranding a ship is not of itself to be deemed a total loss, yet it may be attended with circumstances that will justify an abandonment, even though the hull of the ship should not be materially damaged; if, for instance, the cost of removal would exceed the worth of the ship.—*See* KENT's *Comm.*, vol. iii. p. 402.

Sturgeon Fishery. The sturgeon is a large, valuable, and well-known fish, of which there are several species: viz., the sturgeon, properly so called, or *Accipenser sturo;* the beluga, or *Accipenser huso;* the sevruga, or *Accipenser stellatus*, etc. The sturgeon is plentiful in the North American rivers, and on the southern shores of the Baltic; and is met with in the Mediterranean, etc. But it is found in the greatest abundance on the northern shores of the Caspian, and in the rivers Wolga and Ural; and there its fishery employs a great number of hands, and is an important object of national industry. Owing to the length and strictness of the Lents in the Greek Church, the consumption of fish in Russia is immense; and from its central position, and the facilities afforded for their conveyance by the Wolga, the products of the Caspian fishery, and those of its tributary streams, are easily distributed over a vast extent of country. Besides the pickled carcasses of the fish, caviar is prepared from the roes; and isinglass, of the best quality, from the sounds. The caviar made by the Ural Cossacks is reckoned superior to any other; and both it and isinglass are exported in considerable quantities. The belugas are sometimes of a very large size, weighing from 1000 to 1500 lbs., and yield a good deal of oil. The seal-fishery is also pretty extensively prosecuted in the Caspian. The reader will find a detailed account of the mode in which the fisheries are carried on in the Caspian, and in the rivers Wolga and Ural, in TOOKE's *Russia*.—*See* FISHERIES.

Sub-treasury. The sub-treasury system is one peculiar to the general government of the United States; whereby the separate and safe-keeping of the public funds is intrusted to special officers appointed for this purpose. From the year 1789 to the year 1846 the public funds were entrusted as deposits in numerous banking institutions throughout the Union. The failures of many of these during the years 1837–1842 led to the establishment, on the 6th August, 1846, of the Independent Treasury, or Sub-treasury. By this law of Congress, the "rooms prepared and provided in the new treasury building at the seat of government (Washington), for the use of the Treasurer of the United States, his assistants and clerks, and occupied by them, and also the fire-proof vaults and safes erected in said rooms for the keeping of the public moneys in the possession and under the immediate control of said treasurer, and such other apartments as are provided for in this act as places of deposit of the public money, are hereby constituted and declared to be the Treasury of the United States." The sub-treasuries for the reception of the public funds are at Boston, New York, Philadelphia, and other cities; generally in the buildings used and known as the custom-houses. The assistant treasurers receive the following salaries: Boston, $2500; New York, $4000; Philadelphia, Charleston, New Orleans, St. Louis, $2500 each. After the 1st January, 1847, all duties, taxes, sales of public lands, postage, and all other revenue, were made payable in gold or silver coin only; and all disbursements by or for account of the Treasury were by law made payable in the same medium.

Succory. *See* CHICORY.

Suez Canal. If we compare the mean distances between the ports of Europe and India, by the Cape of Good Hope on the one hand, and by the intended channel between the two seas on the other, we shall find an

enormous difference in favor of this latter route. This difference will be still greater if we remember that a straight line on the chart of navigation is far from being the shortest distance from one port to another, and the seaman can only reach the point for which he is steering by following a certain number of successive courses, approaching as near as possible the arc of a great circle. Thus, far from making directly for the Cape of Good Hope, vessels leaving Europe or the Atlantic ports of North America, *en route* for India, must steer for the Canaries or Azores, in order to find the trade-winds of the northern hemisphere, to make the coast of Brazil, and sight Cape Frio, or put into harbor at Rio Janeiro. This is generally the route for the Cape of Good Hope, more justly, perhaps, called the Cape of Storms. They then cross the Aguihas Bank, reach Bourbon or Mauritius, and from thence steer for India, following the routes allowed by the monsoons. Vessels in the Mediterranean again have to contend with still greater disadvantages. It often takes them fifteen days to reach the Straits of Gibraltar, westerly winds generally prevailing in this quarter, where we also find a rapid flow of the ocean waters into the Mediterranean. Thus the voyage to India takes at least five months, or five months and a half, the voyages home being rather more direct, without being sensibly shorter. Ships then run nearer to the African shore, by reason of the trade-winds of the southern hemisphere; the place of call in this case being St. Helena.

If we now examine the facilities for navigation in the three seas near the Canal of Suez, namely, the Mediterranean, the Red Sea, and the Gulf of Oman, we find:

That in the Mediterranean the winds blow from the north during the greater part of the year, change southeast in the spring, and return to the north, passing by the west and northwest.

That nearly the same takes place in the Red Sea, where the north, which is the prevailing wind, heaps the waters in the direction of Babelmandel, so that during a calm we observe a current setting northward, evidently arising from the elevated waters in the south endeavoring to recover their level. Southerly winds generally succeed a calm.

The Gulf of Oman has two monsoons—the northeast monsoon, which generally continues during the winter, and southwest monsoon, which lasts during the summer, and is frequently stormy. The change from one monsoon to the other is there, as elsewhere, accompanied by a series of storms and gales.

The considerable reduction of the distance of European ports from those of India would not be the only advantage to trade from adopting the canal between the two seas; for not only would vessels reach their point of destination much sooner, but they would find places of anchorage throughout the entire route, and also, what is of more importance still, they would meet with good markets. The navigator, after having followed the usual easy routes of the Mediterranean, would dispose of part of his cargo in the Canal of Suez, or at Djedda, would purchase ivory at Massarva, Souaken, or Derbera, which he would exchange in India for opium to take to China in exchange for silk and tea. He would complete his home cargo in colonial merchandise from Manilla, the Isles of Sunda and Ceylon; in cotton of India and Egypt; in coffee of Abyssinia or Yemen; the gum of Soudon or Hedjaz; the corn of Lower Egypt, or rice of Damietta; and these numerous operations, which now require years, would be accomplished rapidly and without danger with small capital and small vessels. In short, by reducing the time necessary for the operations of commerce, we reduce the general expense.

All nations would take advantage of the importance of the trade with India, China, and the islands of the ocean. Trade with the Red Sea, although less considerable, deserves attention; but as there is scarcely any carried on at present, it is very little known, and could only acquire importance by the opening of a canal between the two seas. The Red Sea, which is so near to us in a straight line, becomes far distant when we have to double the Cape. Babelmandel is as far from us as Pondicherry, and Souaken as far as Batavia; Suez, farther still, by this route becomes as near as Beyrout by the canal; In short, the two routes, measured from the Straits of Gibraltar to Souaken, are in the proportion of one to five.

Very few European vessels are now met with in the Red Sea. Every year we see a few belonging to the Parsees of Bombay, and manned by Lascars. The internal trade of this sea is now carried on by Arabian barks, called *dows*, or *boutres*, constructed at Suez, Djeddo, Kossair, Souaken, or Mocha, with wood from India to Singapore. These vessels are of a very small tonnage, are very sharp, and have a handsome sheer; a heavy poop, which hinders their working, and lowers it at the stern; they carry one mast, rigging a square sail; this sail and yard are struck to the foot when they lay to; about thirty men are required to hoist it again, and this operation can not be performed in less than half an hour. The tacking of these ships is as difficult as it is dangerous. The dows only sail in the daytime; they get under way about seven o'clock in the morning, sail till about four in sight of the coast, then anchor by a grappling-iron, or run aground on the sand.—*London Nautical Magazine.* See also *Southern Quarterly Review*, ix. 57.

Messrs. Conrad, A. Renaud, Megrilli J. M'Lean, and Lieusson, the members of the international commission for cutting a canal through the Isthmus of Suez, have terminated their investigations in Egypt, and given in to the viceroy a brief preliminary report. They found insuperable obstacles to directing the canal on Alexandria, and unexpected facilities for establishing a port in the Gulf of Pelusium. They are therefore unanimously of opinion that a direct canal from Suez toward the Gulf of Pelusium is the only solution of the problem of the junction of the Red Sea and the Mediterranean. "The execution thereof is easy, the success certain, the results immense for the commerce of the world." The expense of the canal and of the works connected with it will not, it is added, exceed 200,000,000 francs.

Sugar (Fr. *Sucre*; Ger. *Zucker*; It. *Zucchero*; Russ. *Sachar*; Sp. *Azucar*; Arab. *Sukhir*; Malay, *Soola*; Sans. *Surkarā*), a sweet granulated substance, too well known to require any particular description. It is every where in extensive use, and in this country ranks rather among the indispensable necessaries of life than among luxuries. In point of commercial importance, it is second to very few articles. It is chiefly prepared from the expressed juice of the *Arundo saccharifera*, or sugar-cane; but it is also procured from an immense variety of other plants, as maple, beet-root, hiren, parsnep, etc.

Species of Sugar.—The sugar met with in commerce is usually of four sorts; brown, or muscovado sugar; clayed sugar; refined, or loaf sugar; and sugar-candy. The difference between one sort of sugar and another depends altogether on the different modes in which they are prepared.

Brown, or Muscovado Sugar.—The plants or canes being crushed in a mill, the juice, having passed through a strainer, is collected in the clarifier, where it is first exposed to the action of a gentle fire, after being "tempered" (mixed with alkali), for the purpose of facilitating the separation of the liquor from its impurities. It is then conveyed into the large evaporating copper, and successively into two others, each of smaller size: the superintending boiler freeing it during the process from the scum and feculent matters which rise to the surface. The sirup then reaches the last copper vessel, called the "striking tache," where it is boiled till sufficiently concentrated to be capable of granulating in the cooler, whence it is transferred with the least

possible delay, to prevent charring. Here it soon ceases to be a liquid; and when fully crystallized, is put into hogsheads (called "potting"), placed on their ends in the curing-house, with several apertures in their bottoms, through which the molasses drain into a cistern below. In this state they remain till properly cured, when the casks are filled up and prepared for shipment.

Clayed sugar is prepared by taking the juice, as in the case of muscovado sugar, when boiled to a proper consistency, and pouring it into conical pots with the apex downward. These pots have a hole at the lower extremity, through which the molasses and sirup are allowed to drain. After this drain has continued for some time, a stratum of moistened clay is spread over the surface of the pots; the moisture of which, percolating through the mass, is found to contribute powerfully to its purification.

Refined sugar may be prepared from muscovado or clayed sugar by redissolving the sugar in water, and, after boiling it with some purifying substances, pouring it, as before, into conical pots, which are again covered with moistened clay. A repetition of this process produces *double refined* sugar. But a variety of improved processes are now resorted to.

Sugar-candy.—Solutions of brown or clayed sugar, boiled until they become thick, and then removed into a hot room, form, upon sticks or strings put into the vessels for that purpose, into crystals or candy.

Historical Notice.—The history of sugar is involved in a good deal of obscurity. It was very imperfectly known by the Greeks and Romans. Theophrastus, who lived about 320 years before the Christian era, the first writer whose works have come down to us by whom it is mentioned, calls it a sort of "honey extracted from canes or reeds." Strabo states, on the authority of Nearchus, Alexander's admiral, that "reeds in India yield honey without bees." And Seneca, who was put to death A.C. 65, alludes to sugar in a way which shows how little was then known respecting it (Epist. 84): *Aiunt*, says he, *inveniri apud Indos mel in arundinum foliis, quod aut ros illius cœli, aut ipsius arundinis humor dulcis et pinguior gignat.* Of the ancients, Dioscorides and Pliny have given the most precise description of sugar. The former says, it is "a sort of concreted honey, found upon canes, in India and Arabia Felix; it is in consistence like salt, and is, like it, brittle between the teeth." And Pliny describes it as "honey collected from canes, like a gum, white and brittle between the teeth; the largest is of the size of a hazel-nut: it is used in medicine only."—*Saccharum et Arabia fert, sed laudatius India; est autem mel in arundinibus collectum, gummium modo candidum, dentibus fragile, amplissimum nucis avellanæ magnitudine, ad medicinæ tantum usum.*—Lib. xii. c. 8. It is evident, from these statements, that the knowledge of the Greeks and Romans with respect to the mode of obtaining sugar was singularly imperfect. They appear to have thought that it was found adhering to the cane, or that it issued from it in the state of juice, and then concreted like gum. Indeed, Lucan expressly alludes to Indians near the Ganges—

Quique bibunt tenerâ dulces ab arundine succos.
—Lib. iii. l. 237.

But these statements are evidently without foundation. Sugar can not be obtained from the cane without the aid of art. It is never found native. Instead of flowing from the plant, it must be forcibly expressed, and then subjected to a variety of processes. It is not, however, quite so clear, as has been generally supposed, that the Romans were wholly unacquainted with the mode of procuring sugar. The remarkable line of Statius,

Et quas percoquit Ebusia cannas—Sylv. lib. i. v. 15,

has been conjectured, apparently on good grounds, to refer to the boiling of the juice of the cane. But the passage has been differently read, and is too enigmatical to be much depended on. Dr. Moseley conjectures, apparently with much probability, that the sugar described by Pliny and Dioscorides, as being made use of at Rome, was sugar-candy obtained from China. This, indeed, is the only sort of sugar to which their description will at all apply. And it would seem that the mode of preparing sugar-candy has been understood and practiced in China from a very remote antiquity; and that large quantities of it have been in all ages exported to India, whence, it is most probable, small quantities found their way to Rome.—*Treatise on Sugar.* This, as well as Dr. Moseley's *Treatise on Coffee*, is a very learned and able work. Europe seems to be indebted to the Saracens not only for the first considerable supplies of sugar, but for the earliest example of its manufacture. Having, in the course of the 9th century, conquered Rhodes, Cyprus, Sicily, and Crete, they introduced into them the sugar-cane, with the cultivation and preparation of which they were familiar. It is mentioned by the Venetian historians that their countrymen imported, in the 12th century, sugar from Sicily at a cheaper rate than they could import it from Egypt.—*Essai de l'Histoire du Commerce de Venise*, p. 100. The crusades tended to spread a taste for sugar throughout the Western World; but there can be no doubt that it was cultivated, as now stated, in modern Europe antecedently to the era of the crusades; and that it was also previously imported by the Venetians, Amalphitans, and others, who carried on a commercial intercourse from a very remote epoch with Alexandria and other cities in the Levant. It was certainly imported into Venice in 996.

The art of refining sugar, and making what is called loaf-sugar, is said by Dr. Moseley to be a modern European invention, the discovery of a Venetian about the end of the 15th, or the beginning of the 16th century.—MOSELEY, p. 66. But this is doubtful, for Le Grand D'Aussy has shown that white, or, as he calls it, refined sugar (*sucre blanc ou raffiné*), had been introduced into and used in France for more than a century and a half previously to the date assigned for the discovery of the process of refining in Venice. But white sugar is not necessarily, as Le Grand D'Aussy seems to suppose, refined: it may be merely clayed, like Havana sugar, which is as white as refined sugar. Loaf or lump sugar is unknown in the East, sugar-candy being the only species of refined sugar that is made use of in India, China, etc. The manufacture of sugar-candy is carried on in Hindostan, but the process is extremely rude and imperfect. In China, however, it is manufactured in a very superior manner, and large quantities are exported. When of the best description, it is in large white crystals, and is a very beautiful article. Two sorts of sugar-candy are met with at Canton, viz., Chinchew and Canton; the former being the produce of the province of Fokien, and the latter, as its name implies, of that of Canton. The Chinchew is by far the best, and is about 50 per cent. dearer than the other. Chinese sugar-candy is extensively consumed by Europeans at the different settlements throughout the East. The exports of sugar-candy from Canton in 1846 for British India and Australia amounted to 38,584 piculs, or 2296 tons. Within the last four or five years raw sugar has begun to be rather largely exported from China to England, the shipments for the latter in 1846 having amounted to 18,520 tons. But the speculation did not turn out well; and it is doubtful whether the sugar of China will be able to withstand the competition of that of Brazil and Cuba.—*Vie Privée des François*, ii. 198, ed. 1815. This sugar was imported from Egypt principally by Italians; and the probability is, that the latter were the first Europeans who practiced the art, which, however, would appear to have originated in the East. The cane had, as already seen, been introduced into Sicily, and its culture practiced previously to the middle of the 12th cen-

tury. It also was carried to Spain and cultivated by the Saracens soon after they obtained a footing in that country. The first plantations were at Valencia; but they were afterward extended to Granada and Murcia. Mr. Thomas Willoughby, who traveled over the greater part of Spain in 1664, has given an interesting account of the state of the Spanish sugar plantations, and of the mode of manufacturing the sugar. Plants of the sugar-cane were carried by the Spaniards and Portuguese to the Canary Islands and Madeira, in the early part of the 15th century; and it has been asserted by many that these islands furnished the first plants of the sugar-cane that ever grew in America.

Barbadoes is the oldest settlement of the English in the West Indies. They took possession of it in 1627, and so early as 1646 began to export sugar thence to England. The trade of Barbadoes attained its maximum in 1676, furnishing, it is said, employment, at that period, for 400 sail of vessels, averaging 150 tons burden; but this statement is most probably exaggerated.

Jamaica was discovered by Columbus in his second voyage, and was first occupied by the Spaniards. It was wrested from them by an expedition sent against it by Cromwell in 1656; and has since continued in the possession of the English, forming by far the most valuable of their West Indian colonies. At the time when it was conquered, there were only three small sugar plantations upon it. But, in consequence of the influx of English settlers from Barbadoes and the mother country, fresh plantations were speedily formed, and continued rapidly to increase.

The sugar-cane is said to have been first cultivated in San Domingo, or Hayti, in 1506. It succeeded better there than in any other of the West Indian islands. Peter Martyr, in a work published in 1530, states that in 1518 there were 28 sugar-works in San Domingo, established by the Spaniards. "It is marvelous," says he, "to consider how all things increase and prosper in the island. There are now 28 sugar-presses, wherewith great plenty of sugar is made. The canes or reeds wherein the sugar groweth are bigger and higher than in any other place, and are as big as a man's wrist, and higher than the stature of a man by the half. This is more wonderful, that whereas in Valencia, in Spain, where a great quantity of sugar is made yearly, whensoever they apply themselves to the great increase thereof, yet doth every root bring forth not past 5 or 6, or at most 7 of these reeds; whereas in San Domingo one root beareth 20, and oftentimes 30."

Sugar from San Domingo formed, for a lengthened period, the principal part of the European supplies. Previously to its devastation in 1790, no fewer than 65,000 tons of sugar were exported from the French portion of the island.

Introduction and Cultivation of the Sugar-cane in America.—Sugar-cane occurs in a wild state on many of the islands of the Pacific, but in no part of the American Continent, notwithstanding a contrary opinion has been expressed. Its cultivation and the manufacture of sugar were introduced into Europe from the East by the Saracens, soon after their conquests in the 9th century. It is stated by the Venetian historians, that their countrymen imported sugar from Sicily, in the 12th century, at a cheaper rate than they could obtain it from Egypt, where it was then extensively made. The first plantations in Spain were at Valencia, but they were extended to Granada, Murcia, Portugal, Madeira, and the Canary Islands, as early as the beginning of the 15th century. From Gomera, one of these islands, the sugar-cane was introduced into the West Indies by Columbus, in his second voyage to America, in 1493. It was cultivated to some extent in San Domingo in 1506, where it succeeded better than in any of the other islands. In 1518 there were twenty-eight plantations in that colony, established by the Spaniards, where an abundance of sugar was made, which for a long period formed the principal part of the European supplies. Barbadoes, the oldest English settlement in the West Indies, began to export sugar in 1646, and in the year 1670 the trade required four hundred vessels, averaging 150 tons burden.

The introduction of sugar-cane into Florida, Texas, California, and Louisiana, probably dates back to their earliest settlement by the Spaniards or French. It was not cultivated in the latter, however, as a staple product before the year 1751, when it was introduced by several negroes, by the Jesuits, from San Domingo. They commenced a small plantation on the banks of the Mississippi, just above the old city of New Orleans. The year following, others cultivated the plant, and made some rude attempts at the manufacture of sugar. In 1758 M. Dubreuil established a sugar estate on a large scale, and erected the first sugar-mill in Louisiana, in what is now the lower part of New Orleans. His success was followed by other plantations, and in the year 1765 there was sugar enough manufactured for home consumption; and in 1770 it had become one of the staple products of the colony. Soon after the Revolution, a large number of enterprising adventurers emigrated from the United States to Lower Louisiana, where, among other objects of industry, they engaged in the cultivation of cane, and by the year 1803 there were no less than eighty-one sugar estates on the Delta alone. Since that period, while the production of cane sugar has been annually increasing at the South, the manufacture of maple-sugar has been extending in the North and West.

The common sugar-cane is a perennial plant, very sensitive to cold, and is therefore restricted in its cultivation to regions bordering on the tropics, where there is little or no frost. In the Eastern hemisphere its production is principally confined to situations favorable to its growth, being between the fortieth parallel of north latitude and a corresponding degree south. On the Atlantic side of the Western Continent it will not thrive beyond the thirty-third degree of north latitude and the thirty-fifth parallel south. On the Pacific side it will perfect its growth some five degrees farther north or south. From the flexibility of this plant, it is highly probable that it is gradually becoming more hardy, and will eventually endure an exposure, and yield a profitable return, much farther north, along the borders of the Mississippi and some of its tributaries, than it has hitherto been produced. In most parts of Louisiana the canes yield three crops from one planting. The first season it is denominated "plant cane," and each of the subsequent growths "ratoons." But sometimes, as on the prairies of Attakapas and Opelousas, and the higher northern range of its cultivation, it requires to be replanted every year. Within the tropics, as in the West Indies and elsewhere, the ratoons continue to yield abundantly for twelve, fifteen, and even twenty-four years, from the same roots.

The cultivation of this plant is principally confined to the West Indies, Venezuela, Brazil, Mauritius, British India, China, Japan, the Sunda, Philippine, and Sandwich islands, and to the southern districts of the United States. The varieties most cultivated in the latter are the striped blue, and yellow ribbon, or Java; the red ribbon, or violet, from Java; the Creole crystalline, or Malabar; the Otaheite, the purple, the yellow, the purple-banded, and the gra[illegible] canes. The quantity of sugar produced on an acre varies from 500 to 3000 lbs., averaging, perhaps, from 800 to 1000 lbs.

Hitherto the amount of sugar and molasses consumed in the United States has exceeded the quantity produced, consequently there has been no direct occasion for their exportation. In the year 1815 it was estimated that the sugar made on the banks of the Mississippi alone amounted to 10,000,000 lbs. In 1818 the entire crop of Louisiana was only 25,000,000 lbs.; in 1850 it had reached the enormous quantity of 226,001,000 lbs., besides about 12,000,000 gallons of

molasses. According to the census of 1840, the amount of cane and maple sugar was 155,100,800 lbs., of which 119,047,720 lbs. were raised in Louisiana. By the census of 1850 the cane sugar made in this country was 247,581,000 lbs., besides 9,700,666 gallons of molasses; maple-sugar, 34,249,886 lbs., amounting to 281,830,886 lbs., showing an increase in ten years of 126,730,077 lbs.—*United States Patent Office Report*, 1850.

Adulteration.—Sugar is an article which is especially liable to adulteration; and its high price during the last few years, coupled with the high duty, has given a powerful stimulus to this nefarious practice. Perhaps we might not be far from the mark were we to estimate the quantity of foreign matters intentionally mixed up with sugar, and sold as such in England, previously to the late reduction of duties, at 10,000 or 12,000 tons a year! Sago and potato flour are the articles which have been most extensively used for this purpose. When mixed with sugar they give it a whiter and finer appearance, and, unless the dose be overdone, increase its price about *4s.* a cwt. It is extremely difficult to deal with an abuse of this sort. No doubt the fall in the price of sugar following the placing of the trade on a proper footing, and the reduction of the duty, have lessened the temptation to adulterate. But they have not wholly removed it, the materials employed to adulterate being decidedly cheaper than sugar, however supplied. In this, as in most cases of the sort, the best security against adulteration is to deal only with grocers of the highest character.

Failure of the Sugar-cane in Louisiana.—The culture of sugar-cane in Louisiana has been subject, from the period of its introduction in 1751 up to the present time, to certain unfavorable vicissitudes to which it is not liable in more southern climes. The past has been more marked, perhaps, than any preceding season, both in respect to the amount produced and to the diseases and condition or degeneracy of the cane. The spring of 1854 is represented to have been so extraordinarily dry that most of the cuttings put into the ground perished, even after they had vegetated. Indeed, some few sections only of the sugar-growing parishes were favored even with occasional vernal showers, and the crops in these sections gave better promise than those in other parts of the State. But yet in these the yield was not abundant, as the summer and fall proved otherwise unfavorable to the growth and maturity of the cane; and many planters, who had crops of fair appearance, found, upon grinding and boiling, that the actual yield of sugar to the acre was unusually small. The plant-cane, upon which the cultivators mainly depend, seems to have been a general failure throughout the State; and the small crop made was mostly saved from the stubbles or ratoons. The securing of the crop was also very unfavorable to the planter. At the commencement of the grinding there appeared to be little or no crystallizable sugar in the juice. The cane was not ripe, and the cold and unusually wet winter, which consequently required a large amount of fuel for boiling, was a great drawback; so much so that many of the planters lost a good portion of their crops by not being prepared for these exigencies, while others, rather than grind their immature cane, preferred to let it stand in the fields, even at the risk of losing a part, and did not commence boiling before the 20th of December.

The deterioration, or falling off of the crop, has been attributed to presumed causes, one of which is that based upon the theory of Mr. Knight, of Herefordshire, in England, in the latter part of the last century, namely, that plants propagated by cuttings, or slips, deteriorate and become extinct, unless regenerated from time to time by the production of fresh stocks directly from the seeds. Mr. Knight, it would seem, based his hypothesis upon the fact that certain varieties of the apple in his neighborhood were believed to be running through their natural course, and named as instances the "Golden Pippin" and the "Nonpareil." But the particular cases thus cited failed to sustain his assumption, for the Golden Pippin is believed still to thrive well at Madeira, on many parts of the Continent of Europe, and in England, as well as the Nonpareil, just as they did in the days of Queen Anne.

The cultivated sugar-cane very rarely produces seeds, although this is said sometimes to occur even in the Southern States of this Union; but it has not been shown that the seeds have vegetated when sown; yet there is, no doubt, some country in which the course of nature is followed in this respect. Moreover, it has been averred that there is no region in which the cultivators attempt to resort to this mode of propagation, their dependence being always and entirely upon the cuttings. The theory, therefore, of the insufficiency of this means of propagating the sugar-cane, is without the least foundation, unless it can be shown that a general tendency to decay and extinction is manifested in it throughout the globe—a fact that has not been assumed, and that certainly does not exist.

That the propagation of plants, by their seeds, is the natural method, seems like an infallible proposition; and to the inquiry it naturally suggests respecting their design, if not for this use, it may be difficult to find a conclusive reply. But the vegetable kingdom presents to the mind of the observer so many apparent anomalies, that the student who refuses to progress farther until each in succession is made plain to his understanding, is not likely to proceed far in this most interesting and profitable pursuit.

It is an unfortunate, though very prevalent error, to attribute the diseases of plants to other than the real causes, since by doing so we deprive ourselves of the ability to apply the remedy appropriate to each case. A deficiency or excess of rain, heat or cold, the electric state of the atmosphere, and, what is still more likely, an unfavorable condition of the soil, doubtless more or less induce the diseases or debility of plants; and these may be either local or general. In the case of the sugar-cane of Louisiana, for instance, although it is highly desirable to introduce cuttings of new, and, if possible, better varieties, than are now cultivated in that State, there is a probable cause of deterioration to which the attention of planters has not been effectually directed. It is known that the continued production of a single species of plant upon almost any soil will eventually exhaust that soil of those elements especially required as the pabulum of that plant, if those elements be not carefully ascertained and systematically returned. Is not this probably the case with respect to the sugar-fields of Louisiana? Chemical analyses have shown that nearly one half of the inorganic matter contained in the cane itself is phosphate of lime, and nearly a fourth silica. The bare statement of this fact must assuredly suggest to every mind a prominent cause of the evil. In the continued culture of sugar upon the same lands, as of every thing else, a judicious system of rotation, with a liberal supply of guano, or other animal and phosphated manure, in connection with a due supply of well decomposed vegetable matter, is essential; and, as has been intimated, the latter must be of the kinds specially indicated.

That there has been a degeneracy in the cane, caused by exhaustion of the soil, and injudicious rotation, is obvious, from the fact that the same lands which have been under cultivation for a long period have yielded more than three times the amount of sugar to the acre in some years than in others, the productiveness having been in those cases in which the soil was in its primitive fertility, or when enriched by guano or other appropriate manures. For instance, the British and French West India Islands, some sixty or seventy years ago, yielded from 3000 to 6000 pounds of sugar to the acre. At present they do not yield a third of this amount without manure. The product in Louisiana,

formerly, often reached as high as 3000 or 4000 pounds; and in some cases even to 6000 pounds; but for the last few years it has often ranged as low as from 500 to 1000 pounds to the acre. According to Commodore Perry, in his "Expedition to Japan," before the introduction of guano into Mauritius, the product of sugar on that island was from 2000 to 2500 pounds to the acre; but the increase since the application of this fertilizer has been so extraordinary as to be scarcely credible. In ordinary seasons the product has been from 6000 to 7000 pounds, and under peculiarly favorable circumstances it has even reached 8000 pounds to the acre.

The amount of raw sugar as a gross produce to the acre, in several countries of the globe, from good authorities, is as follows:

Mauritius	6000 pounds.
Brazil	5000 "
Cuba	4000 "
Isle of Bourbon	3300 "
Guadaloupe	2000 "
Vera Cruz	1900 "
Martinique	1700 "
Bengal	1600 "
St. Domingo	1100 "
Louisiana	1000 "

In order to show the fluctuations of the sugar-crop in Louisiana, we have compiled from our records the annexed statement of the sugar product of Louisiana for the past twenty-three years, showing the amount of each year's crop in hogsheads and pounds, with the gross average value per hogshead and total, the proportions taken by Atlantic ports and Western States, and the date of the first receipt of each crop. By this statement it will be seen that the total product of Louisiana from 1834 to 1856 inclusive, a period of twenty-three years, was 3,972,716 hogsheads, valued at $204,131,228, and that of this quantity the Atlantic ports took 1,317,883 hogsheads, and the Western States 1,974,103 hogsheads. The crops from 1828 (which is as far back as our estimates extend) to 1833 summed up 281,000 hogsheads; which would make the total product in a period of twenty-seven years 4,253,716 hogsheads, or 4,477,668,000 pounds. We would here remark that up to 1848 the product in hogsheads is estimated, and 1000 pounds taken as the average weight per hogshead, but for the crop since that date we have taken the figures of Mr. P. A. Champonier, as we find them in his annual statements.

Years.	Total Crop.		Average Price per Hogshead.	Total Value.	Exports from New Orleans.		First Receipts of New Crop
					Exported to Atlantic Ports.	Exported to Western States.	
	Hogsheads.	Pounds.			Hogsheads.	Hogsheads.

In seeking a remedy for the evil here complained of in Louisiana, the minds of many have very naturally been turned to the project of replenishing the canefields of that State by the importation of a fresh supply of cuttings, of such varieties as may be found best suited to the soil and climate. Resort to this means of restoration should be promptly made on a liberal and extensive scale, so that the experiment may be thorough, and, if possible, effectual in its results. An intelligent agent should be selected for the purpose, well acquainted with the character of the cane, and the nature of the soils and climates in which it grows, as well as with the best modes of packing and transporting it to distant parts, either by land or sea; and, what would add much to his qualifications, one who is also acquainted practically with the culture of the plant and the manufacture of sugar.

Among the points on this continent from which the cuttings could be obtained might be instanced the valley of Aragua, in Venezuela, British Guiana, or some favorable locality on the coast of Brazil. On or near the Eastern continent, perhaps British India or the islands of Maritius and Java might prove suitable positions for the procurement of the varieties desired. The agent thus employed should be accurately informed or instructed with reference to the soil, climate, and elevation above the sea, of the sugar districts of these countries, as well as to the age and healthiness of the canes from which the cuttings are to be taken, the parts of the plants from which they are to be obtained, and the proper seasons of procuring them and delivering them at some accessible point in the United States near where they are intended to grow.

The varieties of cane which have hitherto been most cultivated in Louisiana are the Striped-blue Ribbon; the Green Ribbon; the Yellow Ribbon, or Java; the Red Ribbon, or Violet; the Reddish Violet; the Red striped; the Creole; Crystalline, or Malabar; the Otaheite; the Purple; the Yellow; the Purple-banded; the Gray; the Grayish White.

The *Red-striped* cane, which was originally brought from the Dutch colony of Java, and the *Violet* or *Reddish Violet*, which is only a variation from the former, are believed to be the only two varieties that will generally prosper under the climate of the sugar districts of the Southern States. All the other descriptions are too sensitive to cold, except in the warmer parts of the delta of the Mississippi, Florida, and Texas. When planted in new ground, it gives a certain amount of white canes, or those the outside of which is of a grayish white. When cultivated in old soil, however, it furnishes a good yield of violet-red cane. Again, on new ground, a part, say, from one-tenth to one-fifteenth, of the striped cane becomes white, or a dirty grayish white. There are also to be found more or less red stripes on some portions of the stalk, or on the joints; but all the rest of the stalk is entirely gray. On old ground, on the contrary, the red-striped gives red or violet red canes in about the same proportion as above. The tendency of this cane to degenerate rapidly is re-

markable in every part of America. The other varieties are not so liable to deteriorate. After once degenerating, these canes never recover their original color. —*Patent Office Report*, 1855.

Sources whence the Supply of Sugar is derived.—The West Indies, United States, Java, Brazil, Bengal, Mauritius, Siam, the Isle de Bourbon, and the Philippines, are the principal sources whence the supplies required for the European and American markets are derived. The quantities exported in 1857 from these countries, exclusive of molasses, may be estimated as follows:

	Tons.	Tons.
British Colonies.		
West Indies	180,000	
Mauritius	75,000	
British India	75,000	
		330,000
Spanish Colonies.		
Cuba	350,000	
Porto Rico	50,000	
Philippines	25,000	
		425,000
Dutch Colonies.		
Java	75,000	
Guiana	25,000	
		100,000
French Colonies.		
Martinique, Guadaloupe, Isle de Bourbon, etc.		80,000
Danish and Swedish Colonies.		
St. Thomas, St. Cruz, etc.		10,000
Brazil		95,000
United States		100,000
China, Siam, and all other parts		40,000
Production of beet-root sugar in the world		200,000
Production of sorghum and maple-sugars, principally in the United States		200,000
Aggregate tons		1,580,000

Consumption of Sugar in the World.—In the aggregate we shall not, perhaps, be far wrong in estimating the consumption of exported colonial and tropical sugar for the year 1857 as follows:

	Tons.	Tons.
The United Kingdom		420,000
France		165,000
The Netherlands, Belgium, Germany, Prussia, Austria, Hungary, and Austrian Italy, per Dutch ports, deducting re-exports to Russia and other countries	125,000	
Per Hanse Towns	40,000	
Per Antwerp	15,000	
Per Rostock, Stettin, Königsberg, and other ports on the Baltic, excluding the imports from Holland and the Hanse Towns	15,000	
Trieste, Venice, Fiume, etc.	55,000	
		250,000
Spain		50,000
Portugal		10,000
Russia		70,000
Denmark and Sweden		25,000
Italy, Sicily, Malta, Turkey, Greece, and the Levant generally		60,000
United States		435,000
Canada, Australia, Cape of Good Hope, etc.		95,000
Total tons		1,580,000

In the estimate for the United States, the production of cane sugar is included.

STATEMENT OF THE TOTAL QUANTITY OF RAW AND REFINED SUGAR ENTERED FOR HOME CONSUMPTION IN GREAT BRITAIN IN EACH OF THE FIVE YEARS ENDING 1856.

Year ending	Tons.	Tons.
July 5, 1852	368,875	increase, 55,072
" 1853	365,239	decrease, 3,636
" 1854	384,102	increase, 18,863
June 30, 1855	420,208	increase, 42,101
" 1856	372,626	decrease, 53,577

The imports have, in a partial degree, corresponded with the fluctuations in consumption, and these tables show, notwithstanding the large quantities received from the Continent toward the close of last year, and the earlier arrivals from the colonies in the present, that the imports in the year ending the 30th June last were nearly 20,000 tons less than in the preceding twelve months.

STATEMENT OF THE TOTAL QUANTITY OF RAW AND REFINED SUGAR IMPORTED INTO GREAT BRITAIN IN EACH OF THE FIVE YEARS ENDING 1856.

Year ending	Tons.	Tons.
July 5, 1852	396,261	increase, 28,796
" 1853	354,138	decrease, 42,123
" 1854	393,438	increase, 39,300
June 30, 1855	428,879	increase, 35,441
" 1856	409,226	decrease, 19,653

AVERAGE PRICES OF BROWN SUGAR IN THE MONTHS OF JANUARY, MARCH, MAY, JULY, SEPTEMBER, AND NOVEMBER IN THE PORT OF HAVANA DURING THE FOLLOWING TEN YEARS—WITH THE YEARLY AVERAGE VALUE—PRICES IN REALS

Years.	Jan.	March.	May.	July.	Sept.	Nov.	Aver.
1846	6 1/10	5 3/8	5 3/8	5 1/4	6 1/4	6 1/4	5·86
1847	5 9/10	6 1/4	6 3/8	6 1/8	6 1/4	6 3/8	6·18
1848	5 3/8	5 3/4	8 3/8	8 3/8	4 1/4	5 1/4	4·50
1849	5	5	5 1/2	5 1/2	6 1/4	5 1/4	5·61
1850	5	5 3/8	5 1/10	5 1/10	6 1/2	7	5·77
1851	6 1/4	5 3/8	5 3/10	5 1/2	5 1/4	4 9/10	5·37
1852	4 1/2	4 1/2	5 1/10	5 1/2	5 3/4	5 1/4	5·10
1853	5 1/2	5 5/8	5 1/4	5 3/8	5 5/8	5 3/8	5·61
1854	5 5/8	5 3/8	5 1/4	4 9/10	5 3/4	5 7/10	5·37
1855	5 1/4	5 3/8	5 1/2	6 1/2	7 1/2	8	6·65
Average	5·62	5·40	5·30	5·41	5·81	6	5·60

Consumption in the United States.—The consumption of sugar in the United States has been very variable, and the increase of consumption in the last half-dozen years—since the price has been low—is very great. This will be seen in the following tables. We shall first show the importation of foreign sugar. In this account we have subtracted from the quantity imported the amount *re-exported*, so that the statement below gives the prime quantity imported and used in the country for the years given.

FOREIGN SUGAR IMPORTED AND CONSUMED.

Years.	Pounds.	Years.	Pounds.
1837	96,141,352	1848	244,139,753
1840	110,041,297	1850	194,433,629
1842	160,863,475	1853	448,400,644
1845	99,752,969	1855	440,000,000

It will be seen from this that since 1845, a period of ten years, the *importation* of sugar has quadrupled.

It will also be seen that from 1837 to 1839, and from 1850 to 1853, in each period, the importation of sugar doubled. There can be no doubt, from the exhibition of the above figures, that the reduction of prices has had great influence on the importation of sugar. Let us now turn from the foreign to the domestic supply; and first the production of Louisiana and Texas.

The *New Orleans Price Current* furnishes the number of hogsheads raised in the United States for a series of years. Reducing it to pounds, at 1000 lbs. to the hogshead, we have the following result since 1837:

Years.	Pounds.	Years.	Pounds.
1837	65,000,000	1848	220,000,000
1840	87,000,000	1850	211,303,000
1842	140,000,000	1853	449,324,000
1845	186,650,000	1855	231,427,000

We find from the table that the *production* of cane sugar has doubled in the last ten years, and quadrupled in fifteen. In addition to this, the common *maple*-sugar averages about thirty millions of pounds per annum.

Now, taking the aggregate of sugar imported, and that made in the country, we have the following supply, estimated in pounds, for successive years:

TOTAL SUGAR SUPPLY.

Years.	Pounds.	Years.	Pounds.
1837	191,141,352	1848	494,129,753
1840	227,041,297	1850	435,736,629
1842	330,863,475	1853	927,424,644
1845	316,402,969	1855	871,427,000

It may safely be assumed that the average consumption of sugar in the United States is now equal to nine hundred millions of pounds per annum. Deducting from the population of the United States three millions of slaves, who probably use very little sugar, we have the consumption of sugar equal to about 40 lbs.

average for each person. But this consumption of sugar has actually trebled in ten years! This is certainly a very extraordinary fact, and indicates a great change in the habits of living among the people of the United States. That it is a real, absolute change in the habits of life, can not be doubted. Let us show its magnitude by comparing the increase of population with the increase of sugar:

Years.	Increase Population.	Increase Sugar.
1840 to 1845	16 per cent.	50 per cent.
1845 to 1850	16 "	84 "
1850 to 1855	10 "	100 "
1840 to 1855	48 "	300 "

We then see that the consumption of sugar far outruns the increase of population. In 1840 the consumption of sugar was but 16 lbs. per individual. In 1855 it is 40 lbs.

In the period of twelve years, from 1843 to 1854 inclusive, there has been a steady diminution in the *price* of sugar, but not enough to account for the change we see here. The change of prices in New Orleans sugar has been as follows:

1843 to 1846	$58 per hogshead.
1847 to 1850	47 "
1851 to 1854	46 "

The price of sugar to the consumer in the West has diminished much more rapidly than this. The increase of steamboats and the rapid decline of freights has produced a great reduction in the price of tropical products in the West; which has been steadily going on for thirty years. The *effect* of this, together with the increase of population at the West, has produced an extraordinary increase in the consumption of sugar, and especially in the valley of the Ohio. This increase in the Western States is quite remarkable. We find, by a statement in the New Orleans *Price Current*, that in twenty years, from 1834 to 1854, the export of sugar from New Orleans to the Western States amounted to one million eight hundred thousand hogsheads, or about ninety thousand hogsheads per annum; but when we examine the detail, we find the average annual increase to be very rapid. Taking the aggregate of each five years, we have the following result:

1835 to 1839, inclusive	181,500	hogsheads.
1839 to 1844 "	278,500	"
1845 to 1849 "	493,000	"
1850 to 1854 "	806,000	"
1839 to 1844	53	per cent.
1845 to 1849	80	"
1850 to 1854	70	"

The present consumption of Louisiana sugar in the Western States, to which it is carried by steamboats, amounts to an average of 160,000 hogsheads per annum. This is mainly *distributed* through the three great distributing points of the West—Cincinnati, Louisville, and St. Louis.

Another remarkable fact in the commerce in sugar is the increase of American refined sugar. At the present time the amount of refined sugars imported is not half what it was twenty years since; while the amount of sugar exported is four times as much.

Bounty on Exportation of refined Sugar.—Sugar refined in the United States, the growth and production of any other country, is entitled to an allowance of drawback equal to the amount of duties paid on the raw article, on due exportation thereof to any foreign port or place, subject only to the provisions that no drawback shall be allowed on any exportation when such drawback shall not amount to twelve dollars or more. To entitle the exporter to the benefit of said allowance of drawback, such exporter, at least six hours previous to the putting or lading any of the said refined sugar on board any vessel or other conveyance for exportation, shall lodge with the collector of the customs, for the district from which such importation is to be made, an entry setting forth his intention to export the same, and describing the marks, numbers, and packages, and designating the place where deposited, and the name of the vessel or other conveyance in or by which, and the port or place to which, the same is intended to be exported. This entry must be according to form, and, upon presentation, be verified by the oath or affirmation of the owner or agent, or other proper officer of the manufactory in which such sugar may have been refined. If any of such sugar, after it shall have been shipped for exportation, shall be unshipped for any purpose whatever, either within the limits of the United States or within four leagues of the coast thereof, or shall be relanded within the United States from on board the vessel wherein the same shall have been laden for exportation, unless the voyage shall not be proceeded on, or shall be altered from necessity or distress, to save the ship and goods from perishing, which shall be immediately made known to the collector of the nearest district; then the sugar so unshipped, together with the vessel, her boats and equipment, shall be forfeited, and may be seized by any officer of the customs or inspection.

SUGAR TRADE OF THE UNITED STATES.

IMPORTS INTO, EXPORTS FROM, AND CONSUMPTION OF FOREIGN SUGAR IN THE UNITED STATES FOR THE FIVE YEARS ENDING THE 30TH OF JUNE, 1855.—(FROM TREASURY REPORTS.)

Years.	Imports.	Exports.	Consumption
	Pounds.	Pounds.	Pounds.
1851	385,000,000	6,000,000	379,000,000
1852	457,000,000	9,000,000	448,000,000
1853	464,000,000	18,000,000	446,000,000
1854	455,000,000	52,000,000	403,000,000
1855	473,000,000	33,000,000	440,000,000

PRODUCT OF SUGAR IN THE UNITED STATES—EXPORT AND CONSUMPTION THEREOF.—(FROM CHAMPONIER'S AND TREASURY REPORTS.)

Years.	Products.	Exports.	Consumption
	Pounds.	Pounds.	Pounds.
1851	257,000,000	2,000,000	255,000,000
1852	379,000,000	6,000,000	373,000,000
1853	503,000,000	10,000,000	493,000,000
1854	393,000,000	11,000,000	382,000,000
1855	263,000,000	(no data)	263,000,000

SUGAR CROP IN TEXAS, 1855.

Counties.	Number of Hogsheads.
Brazoria	6790
Matagorda	959
Wharton	320
Fort Bend	920
Total	8989

Thus Texas produced in the year 1855 a much better crop than the preceding one, say 9,887,900 pounds against 7,513,000 pounds during the previous season.

The comparative consumption of sugar in Europe and America is a subject of interest. Mr. M'Culloch, the political economist, estimated the consumption of sugar in Great Britain at 24 lbs. per individual, and says this is much more than is consumed in France or any part of the continent. At present the consumption in the United States is 40 lbs. per individual; and thus we see it is much greater than in Europe, or probably any part of the world. This fact is conclusive, if no other could be had, that the people of the United States live more comfortably, and even luxuriously, than any other people in the world, because they have more real income to expend in subsistence and its comforts. High prices tend to diminish consumption. But, on the other hand, the capacity to consume was never so great as at present, owing to the general prosperity. A rapid increase of population will also have a tendency to prevent much reduction in the importation of sugar.

RECEIPTS OF FOREIGN SUGAR IN THE UNITED STATES.

	Tons.
Consumption of foreign in 1856, as above	255,292
Consumption of foreign in 1855	192,607
Increase in 1856	62,685
Consumption of foreign in 1856	255,292
Add crop of 1855-'56, of Louisiana, Texas, Florida, etc., the bulk of which came to market in 1856, and assuming the stock 1st January each year to be equal	123,468
Would make the total consumption of cane sugar in the United States in 1856	378,760
Total consumption of domestic and foreign in 1855	377,752
Increase in 1856	1,008
Consumption of foreign in 1857, as above	241,765
Consumption of foreign in 1856	255,292
Decrease in 1857	13,527
Consumption of foreign in 1857	241,765
Add crop of 1856-'57 of Louisiana, Texas, Florida, etc., the bulk of which came to market in 1857, and assuming the stock 1st January each year to be equal	39,000
Would make the total consumption of cane sugar in the United States in 1857	280,765
Total consumption of foreign and domestic in 1856	378,760
Decrease in 1857	97,995

"The foregoing statistics present in a clear and concise view the extent of this branch of our commerce for the past year. It will be seen that the total receipts of foreign unrefined sugar into the United States, during the year ending December 31, 1857, were 269,180 tons, against receipts in 1856 of 275,662 tons, and in 1855 of 205,064 tons; and the quantity of this description taken for consumption in 1857 was 241,765 tons, against 255,292 tons in 1856, and 192,607 tons in 1855, being a decrease in the consumption of foreign in 1857, as compared with 1856, of 13,527 tons, or 5$\frac{3}{10}$ per cent.; while the total consumption of foreign and domestic in 1857 was 280,765 tons, against a total consumption in 1856 of 378,760 tons; in 1855, 377,752 tons; in 1854, 385,298 tons; in 1853, 372,989 tons; in 1852, 315,217 tons; and in 1851, 288,485 tons—making a decrease in the total deliveries for consumption in 1857, as compared with 1856, of 97,995 tons, or 25$\frac{7}{10}$ per cent. If we discard entirely the Melado, etc., the deficiency in the consumption of 1857 will be considerably greater, as it would then stand—Consumption of foreign, 220,644 tons, against a consumption of foreign in 1856 of 255,292 tons, decrease 13$\frac{7}{10}$ per cent.; or, total consumption of foreign and domestic cane sugar in 1857, 259,644 tons, against a total consumption in 1856 of 378,760 tons, being the large decrease of 31$\frac{4.0}{100}$ per cent.

"We reduce our estimate of the quantity of sugar made from molasses during the past year; the high and very unusual prices which prevailed during the largest part of it made the business an unprofitable one. After the heavy decline in the price of molasses, which took place in October, manufacturing was resumed with considerable vigor, but not to a sufficient extent to repair the previous large deficiency. An intelligent observer estimates the quantity of sugar made from molasses in 1857 at 10,300 tons, yielded from 46,000 hhds. molasses, against 11,875 tons, from 53,000 hhds. in 1856; 11,160 tons, from 50,000 hhds. in 1855; and 14,923 tons, from 66,500 hhds. in 1854; if we add to this the product of the maple-tree the past year, say 35,000 tons, and the estimated consumption of California and Oregon, 6000 tons, would make the total consumption of raw sugar in the United States in 1857, 332,065 tons, against a total consumption in 1856 of 412,135 tons—making the decrease in the consumption of all kinds, say 19$\frac{4.2}{100}$ per cent. The quantity of foreign sugar consumed in 1857 by the several ports (not including the coastwise receipts, they being embraced in the calculation at the original port of entry), was—New York, 142,187 tons; Boston, 28,111; Philadelphia, 21,157; Baltimore, 18,869; New Orleans, 20,448; and other ports, 10,993: total, 241,765 tons.

"A somewhat novel feature in this trade has been the large importation during the past year of the article known as melado, etc., the receipts into the country having reached equal to about 70,000 hhds.—say 23,400 tons sugar (deducting 50 per cent. from weight, to make them equal to ordinary grades sugar, which, it will be observed, we have done throughout the statement in all cases of receipts, stocks, and exports). We understand, however, that the importation of this article has proved far from lucrative, and the proba-

bilities are that the commerce in these goods for the year now entered upon will be comparatively small.

"Mercantile enterprise seems to have ransacked the 'uttermost parts of the earth' to procure supplies of this article, so essential to the comfort of the human family; and not only the 'highways,' but the 'by-ways' of commerce have been diligently explored, and scarce a field left ungleaned; hence we have seen within the twelve-month cargoes and invoices landed here from parts of the globe hitherto scarcely known as sugar-producing countries.

"The very extraordinary prices that sugar has commanded during the past two or three years, but especially the first half of last year, has been the means of transferring this article from the catalogue of the necessaries to that of the luxuries of life, and the consumption, as we have seen, has been greatly curtailed. If we add to this the partial, and in many parts of the country the entire failure of the fruit crops (very large quantities of sugar being usually consumed, when fruits are abundant, in the manufacture of conserves, jellies, etc.), together with the intense and almost unparalleled money panic, and rigid economic contraction, which supervened from early autumn till now, the great diminution in the consumption is readily accounted for. Bread, and a few other articles of daily use, are very difficult to economize in, at almost any valuation; but the case is different with sugar—it assumes the character of a luxury, or necessity, according to its cost.

"A by no means insignificant cause aiding the reduction of the consumption of cane sugar in this country the past year, may be traced to the unusual, and, we believe, unprecedented yield of sugar made from the maple-tree. The season was one of the most favorable remembered, extending over a period of nine weeks (three to four weeks being the usual length), and the farmers, stimulated by the prices that were current for sugar, labored indefatigably at the sap kettles; and the result is, that the product of the United States, the past season, of this description of sugar, is set down at 36 @ 38,000 tons. There are, unfortunately, no reliable data to determine the extent of the crop, but after carefully collating the information in our possession, we have no doubt that the yield was fully up to 35,000 tons—a very important item in our consumption, and contributing in no inconsiderable degree to the relief of the last year's deficiency in the product of the sugar-fields of Louisiana.

"The sanguine expectations that were entertained by many in the early part of the year with regard to the sorgo, or African and Chinese imphee, have not been realized. The experiment of cultivating this plant for its sugar properties has been entered into the past season quite extensively in many parts of the country, but, as far as we can gather, though there have been a few isolated cases of success, the general result has been unsatisfactory. A very fair quality of molasses has been produced, but there seems to be a difficulty in concentrating and granulating the sirup, owing either to a deficiency of saccharine qualities, or an ignorance in treating the juice of the cane; at all events, we believe it is generally conceded that crystallizable sugar can not be obtained here from the imphee in sufficient quantities to repay the labor and expense of cultivating it, even when sugars rule at a high currency.

"The supply of foreign needed, is governed in agreat measure by our domestic crop, and hence there is a general interest felt as to the probable extent of the yield. In our last annual statement we said that the Louisiana crop, then coming forward, was estimated at from 80,000 to 120,000 hhds.; the actual out-turn was only 73,976 hhds., against 449,324 hhds. in 1853, the large crop year."—*N. Y. Price Current*, January, 1858.

The present crop of Louisiana, concerning which such high expectations were entertained during the early part of last year, while yet growing, has again proved a comparative failure, notwithstanding a larger breadth of land was placed under cultivation. Planters having been greatly stimulated by the high currency, and having during the fall and winter months of 1856 and 1857, little or no sugar to make, were enabled to place all their laborers into their fields, and put them into a very high state of cultivation; but a late spring, a dry summer and fall, and a heavy and unexpected frost occurring on the 20th November, appointed their hopes, and the yield will not, according to the best authorities, exceed 250,000 hhds., and it may not reach that figure. The consumption of the valley of the Mississippi, including New Orleans and neighborhood, with sugars at a moderate price, is estimated at 150,000 @ 160,000 hhds. (it has reached 208 @ 210,000 hhds. when low rates prevailed), leaving available for shipment to the Gulf and Atlantic ports 80,000 @ 90,000 hhds.

The preceding tables show that the receipts into this port direct, of foreign unrefined sugar, for the year ending December 31, 1857, were 161,942, against an import of 171,156 tons in 1856, 126,844 in 1855, and 99,491 in 1854; and the quantity of foreign taken from here for consumption in 1857 was 148,892 tons, against a consumption of foreign in 1856 of 161,455; in 1855, 121,356; and in 1854, 92,500.

The port of New York has received and delivered for consumption $58\frac{81}{100}$ per cent. of the whole quantity of foreign imported into the United States during the past year.

It having been ascertained at an early period of the season that the crop of Louisiana sugar would prove not only deficient, but almost an entire failure, and that the fields of Cuba would scarcely return an average yield, an impetus was immediately given to the foreign trade, seldom if ever before witnessed, and the importation of the first six months was without a parallel in its history. The extreme and unusual prices soon told, however, with unerring effect upon the consumption, and the contrast between the departure of the year 1857 and its commencement is sharply defined; buoyancy, elasticity, and confidence marked the opening months—depression, languor, and timidity the closing ones.

The past year will be long remembered by those engaged in the sugar trade as one of unparalleled excitement, great fluctuations, and no little disaster, stamping it as far the most eventful one, at least in the present century. The prices of this article, which had been steadily advancing for nearly three years, reached in early summer their maximum, and the decline since then has been rapid and extreme; there are, however, but few interests that have suffered so greatly from the effects of the financial hurricane, that has devastated almost the whole commercial world during the past four months, as the one now under review, and the number is also still less that have withstood the storm more bravely; this fact seems to warrant the belief that the trade rests on a more than ordinary substantial basis. The losses that have been sustained, though considerable, have fallen in a great measure upon the planters and speculators of Cuba, on whose account the bulk of the stock here was held, and they having during the preceding two years realized large advances by the rapid appreciation in prices which have ruled in all the marts of the world, and which placed them in a very strong position, have been enabled to support these losses, it is believed, with comparatively little inconvenience.—*Ibid.*

At the commencement of the year the stock of foreign at this port was 9816 tons, against a stock of 3049 tons, January 1, 1856. During the early part of the month of January, the demand was quite moderate from the trade, and the refiners being generally engaged, according to custom, in making their annual repairs, etc., to their machinery, the business was

small; this dullness, however, was soon followed by an increased activity. It having been satisfactorily ascertained that the crop of Louisiana would be a very small one, refiners entered the market with spirit, and prices advanced on all kinds ¼ @ ½ of a cent. A firm, buoyant feeling prevailed throughout the month, though at the close a falling off in the demand was observable; full prices were, however, realized without difficulty, holders having constantly the advantage. On the 13th, the first arrival of new crop melado reached here, and sold at 7½ cents; and on the 15th, 87 hhds. new Cuba muscovado arrived, and was placed at 10 @ 10½ cents, the opening price the previous year being 7½ @ 8 cents. The sales and resales for the month were 75 hhds. New Orleans, 4800 hhds. and 18,600 boxes; Cuba, 1850 hhds.; Porto Rico, 280 hhds.; English Island, 288 cases and 4328 bags Brazil, and 613 hhds. melado.—For further information, see De Bow's *Review*, vii. 56 (R. S. M'Culloch), iii. 244, 294, x. 218, xii. 646, xiii. 57, 176, iv. 229, 383, 511, v. 349; *Southern Quarterly Review*, iii. 329; *North American Review*, xl. 415; *Edinburgh Review*, l. 426.

The following table shows the range of prices of sugar in New York each month, and average value of the various descriptions of sugar each year, for the past four years:

The Range of Prices of sugar at New York during four Years—1854-'57.

Beet-root Sugar.—The manufacture of sugar from beet-root is carried on to a very considerable extent in several parts of the Continent, particularly in France and the north of Germany. It began in France during the exclusion of colonial products in the reign of Napoleon, and received a severe check at the return of peace, by the admission of West India sugars at a reasonable duty. It is probable, indeed, that it would long since have been entirely extinguished but for the additions made to the duties on colonial and foreign sugars in 1820 and 1822. After the last-mentioned epoch, however, the production of beet-root sugar began rapidly to increase; and such was its progress, that though, in 1828, its produce did not exceed 4,000,000 kilograms, it amounted in 1838 to 39,199,408 kilograms.

Up to the middle of the 18th century the cane was the only plant known to contain sugar. In 1747 M. Marggraf, director of a department of the Royal Academy of Sciences in Berlin, first called attention to the saccharine substance in the parsnep, the birch juice, and carrot. At a later period, Parmentier discovered the same ingredient in the composition of corn and chestnuts. But the chemical experiments made by these savans accomplished no practical result. Yet, even before Napoleon I. had imposed on Europe the principle of absolute prohibition, the necessity of a substitute for the expensive colonial sugar was urgently felt. As

early as 1796 the beet-root was analyzed by Achard in Berlin, who obtained from 100 lbs. of the raw material 5 lbs. of white sugar and three of molasses.

It was only since 1830 that the production of indigenous sugar began to manifest its inherent strength. From three million tons in 1830, it rose to sixty-five millions, or half the consumption of the empire, in 1850, and this was accomplished under the pressure of an impost of from 16½ to 22 francs per 100 kilograms upon the home manufacture. "The last ten years have shown," remarks Mr. Tegoborsky, "that there is a vitality about the manufacture of beet-root sugar on the continent of Europe which was far from being imagined twenty or thirty years ago." Considering that in France it so quickly recovered from the blow dealt in 1843, by an impost placing it gradually on a level with the sugar of the colonies; that the terror then experienced by the French manufacturer, which made him, in many instances, abandon his establishments, was now felt by the rival colonists; that in Germany, where the tax of 1842 at first arrested the home manufacture, it immediately resumed the ascending movement, so that the production of 124,000 centners in 1843 had risen to 660,000 in 1849, or quintupled in the short space of six years.

The quantity of crystallizable sugar contained in the cane and beet-root is equally variable in both, depending on the quality of the plant, soil and climate, etc. The saccharine substance in the cane varies from 10 to 30 per cent.; in the beet-root from 5 to 13. In the former 18, in the latter 10 per cent. are generally admitted as a fair average. The difference, however, in favor of the cane is, as will be seen presently, equalized in consequence of the advantages attending the manufacture of sugar from beet-root, irrespective of those derived from the culture of the latter. In the cane 90 per cent. is liquid to 10 per cent. solid matter; in the beet-root 95 is liquid to 5 per cent. only of solid filamentous substance. The extraction of juice, by means of the hydraulic press, from the latter exceeds, therefore, by five per cent. the quantity obtained from cane. Of the 95 per cent. of liquid absolutely contained in the beet-root, from 75 to 85 per cent., on an average, are practically gained by the process of compression, while the juice extracted from the cane in the colonies represents only 50 per cent., on an average. In Bengal it is no more than 30, and where the best appliances are used it does not exceed 60. Thus, of the 10 per cent. of saccharine matter, which is absolutely contained in the beet-root, from 7½ to 8½ per cent. are realized as sugar, while from the 18 per cent. of the cane from 10 to 12 per cent. of sugar are realized, and in Bengal only 7. Hence, at this stage of the demonstration of the comparative value of cane and beet-root, respecting the practical results obtained from them, we find the difference already reduced from 9 to 5, representing their proportion of saccharine matter, to 12 to 8½, representing the sugar actually realized. The sugar of which we speak here is not yet crystallized. The process of crystallization modifies still further the above difference in favor of the beet-root. Of the 7½ to 8½ per cent. of beet-root sugar, the residue, in the form of molasses, has been diminished, in consequence of modern improvements, to from 1½ to 2½ per cent., which leaves from 6 to 7 per cent. as solid crystallized and marketable sugar.

The results obtained in this respect from cane-juice in the tropical colonies we present in the following table:

	Crystallized Sugar. Pounds.	Molasses. Pounds.
100 pounds of cane-juice subjected by the Chemist Avequin, in Louisiana, to a chemical analysis, gave	10	4
II. Experiment with 100 pounds of juice	12	5
III. " " "	10	3
IV. " " "	11	5
From 100 pounds of cane Dupuis obtained in Guadaloupe (1st experiment)	8	3
(3d experiment)		3

The natural superiority of the cane, thus reduced in the process of manufacturing, is nearly neutralized, when the fact is taken into consideration that more time is required for the cane to ripen than for the beet-root. According to an accurate estimate, four crops of the latter can be harvested against three of cane. M. Stolzel, basing his calculation upon this proportion and the foregoing data, arrives at the final result that, on an average, one hundred pounds of cane yield six pounds of crystallized sugar and three pounds of molasses; while, as above stated, one hundred pounds of beet-root yield from six to seven pounds of sugar, and from one and a half to two and a half pounds of molasses.

There is, according to the authority quoted, no difference, therefore, in the manufacture of sugar from beet-root or cane, as regards the quantity of the marketable article obtained from an equal weight of either raw material. But then there are several other important subjects yet to be considered before an opinion can be formed of the relative merits of sugar production in the tropical colonies and northern and temperate regions. In the first case, the productiveness of each acre of land in the former countries by far exceeds that of the same area in the latter. We find the difference illustrated in two tables, computed from the best authorities, by M. Stolzel. After a deduction of 15 per cent. for waste in preparing for the press, and assuming a yield of sugar equivalent to 6 per cent. on the remainder, we obtain,

	Average Crop of Beet-root per Acre.	Product of crystallizable Sugar.
	Centner.	Pounds.
In Austria	209	1405
In Bohemia	158	1061
In Prussia	228	1532
In environs of Heidelberg	191	1283
In France (Department of Nord)	272	1827
In France (other departments)	170	1142
In France (general average)	204	1370

After a deduction made in consideration of the fact above stated, that four crops of beet-root are produced in the same period as three of cane, each acre in the colonies produces,

CRYSTALLIZABLE SUGAR.

	Pounds.
In Louisiana	1000
In San Domingo	1066
In Bengal	1626
In Martinique	1680
In Vera Cruz	1880
In Guadaloupe	2000
In Isle Bourbon	3358
In Cuba	4000
In Brazil	5000

Thus the average of all these figures, or the mean annual produce of sugar per acre in the colonies, is 2400 lbs., in Europe 1360 lbs. The proportion is 18·10 in favor of cane, which is still increased by the higher value of land in Europe than in the tropics. The mean price of land per acre, according to authentic statements, is,

IN EUROPE.

Prussia	£22	7s. @	£25	5s.
Province Magdeburg	96	3s. @	104	—
Austria	15	15s. @	18	16s.
Bohemia	15	15s. @	—	—
Wurtemberg	23	6s. @	—	—
France and Belgium	32	3s. @	40	—

THE COLONIES.

San Domingo	2	2s. @	8	3s.
Jamaica	3	2s. @	6	4s.
Guiana	4	1s. @	5	8s.
Porto Rico	10	7s. @	—	—
Cuba	10	7s. @	20	14s.

The average of the whole is £40 17s. per acre for Europe, and £8 per acre for the colonies. (The average value of farm lands throughout the United States is, according to the census of 1850, $10 79; and in the Northern States it varies between $12 and $60.) To show in what manner these advantages of greater pro-

ductiveness of the land, and its lower price in the colonies, are more than counterbalanced in Europe by the lower rates of interest on the capital required for the purchase of these lands, and the erection of the factories; the more intelligent, efficient, and cheaper labor; the greater abundance and cheapness of the important item of fuel; the advantages of a home market; and the accessary profits derived from the culture of beet-root, in the shape of fodder for cattle, we reserve for a concluding article, together with a review of the practical inducements offered to the cultivators of beet-root, and the manufacture of sugar, by the conditions of the Northern and Middle States of the Union.

Maple-sugar.—A species of maple (*Acer saccharinum*, Linn.) yields a considerable quantity of sugar. It grows plentifully in the United States and in Canada, and in some districts furnishes the inhabitants with most of the sugar they make use of. Though inferior both in grain and strength to that which is produced from the cane, maple-sugar granulates better than that of the beet-root, or any other vegetable, the cane excepted. It is produced from the sap, which is obtained by perforating the tree in the spring to the depth of about two inches, and setting a vessel for its reception. The quantity afforded varies with the tree and the season. From two to three gallons may be about the daily average yield of a single tree; but some trees have yielded more than twenty gallons in a day, and others not more than a pint. The process of boiling the juice does not differ materially from what is followed with the cane juice in the West Indies. It is necessary that it should be boiled as soon after it is drawn from the tree as possible. If it be allowed to stand above twenty-four hours, it is apt to undergo the vinous and acetous fermentation, by which its saccharine quality is destroyed.—BOUCHETTE'S *British America, Timber Trees and Fruits*, Library of Entertaining Knowledge. *See article* MAPLE-SUGAR.

Chinese Sugar-cane.—This new plant seems to be destined to take an important position among our economical products. Its seeds were sent some six years ago from the north of China, by M. de Montigny, to the Geographical Society of Paris. From a cursory examination of a small field of it, growing at Verrieres in France, in the autumn of 1854, Mr. D. J. Browne, then on a mission from the U. S. Patent Office for collecting agricultural information and products, was led to infer that, from the peculiarity of the climate in which it was growing and its resemblance to Indian corn, it would flourish in any region wherever that plant would thrive. From this source he obtained some 200 pounds of the seed, which was distributed in small packages among members of Congress, with the view of experimenting with it in all parts of the Union, and thereby ascertaining its adaptation to the soil and climate, and its economical value in the United States. In numerous instances the results proved highly satisfactory, as it attained the height of twelve or fifteen feet as far north as St. Paul, Minnesota, and matured its seeds at various points in Massachusetts, New York, Pennsylvania, and Illinois. The following year, while in France on a similar mission as above, Mr. Browne obtained several bushels of the seed of this plant, grown from that reputed to have been brought from South Africa by Mr. Leonard Wray, of London, and which has since proved to be identical with that obtained in 1854.

There appears to be a doubt among many in Europe, as well as in this country, as to the true botanical name of this plant. M. Louis Vilmorin, a scientific cultivator of Paris, provisionally gave it the name of *Holcus saccharatus*, which had previously been applied to the common broom-corn, if not to other species, or at least varieties, of some allied plant. He also conjectured that it might be the *Sorghum vulgare* (Andropogon sorghum of others), and thought that it might comprehend a variety, as well as *Andropogon cafra*, *bicolor*, etc., of Kunth. Mr. Wray, who has devoted much time and attention to the cultivation of this plant, with the view of extracting sugar from its juice, at Cape Natal and other places, states that in the southeast part of Caffraria there are at least fifteen varieties of it, some of them growing to a height of twelve and fifteen feet, with stems as thick as those of the sugar-cane (*Saccharum officinale*). M. Vilmorin also says that, in a collection of seeds sent to the Museum of Natural History at Paris in 1840, by M. d'Abadie, there were thirty kinds of sorghum, among the growth of which he recognized several plants having stems of a saccharine flavor. Others are of the opinion that the common broom-corn (*Holcus saccharatus*), the chocolate or Guinea corn (*Sorghum vulgare*), and the Chinese sugar-cane (*Sorghum saccharatum*), all of which contain more or less saccharine matter, belong to the same species, but are variations caused by differences of soil and climate, or by a disposition to sport after the manner of Indian corn, and other plants under cultivation. The Chinese sugar-cane differs from the others in containing a far larger proportion of juice, and consequently is more valuable for fodder and other economical uses.

In 1760 a plant analogous to the one in question was experimented upon at Florence, in Italy, by Pietro Arduino, for the extraction of sugar; yet it must have been of a very different variety, as he describes its seeds as of a clear brown color, while those of the Chinese sugar-cane are of a shining jet black, and in appearance identical with those of the *Sorghum vulgare* of the old collections.

Description and Habit of its Growth.—The Chinese sugar-cane, when cultivated on ordinary land in the United States, somewhat after the manner of broom-corn, grows to a height of from eight to sixteen feet, while in Europe it does not attain more than half this altitude. Its stems are straight and smooth, often covered with a white bloom or down, having leaves somewhat flexuous, falling over and greatly resembling in appearance those of Indian corn, but more elegant in its form. Where cultivated in hills, containing eight or ten stalks each, it puts forth at its top a conical pinnacle of dense flowers, green at first, but changing into violet shades, and finally into dark purple, at maturity. In France, and in the central and northern sections of the United States, it has thus far proved an annual; but from observations made by M. Vilmorin, as well as some experiments in our Southern States, it is conjectured that, from the vigor and fullness of the lower part of the stalks in autumn, by protecting them during the winter, they would produce new plants the following spring. It stands dearth far better than Indian corn, and will resist the effects of considerable frost without injury, after the panicles appear, but not in its younger and more tender state. If suffered to remain in the field after the seeds have ripened and been removed, when the season is sufficiently warm and long, new panicles will shoot out at the topmost joints one or more to each stalk, and mature a second crop of seeds. The average yield of seed to each panicle is at least a gill.

Sulphur, or **Brimstone** (Fr. *Soufre*; Ger. *Schwefel*; It. *Zolfo, Solfo*; Sp. *Azufre*; Arab. *Kibreet*), a crystallized, hard, brittle substance, commonly of a greenish yellow color, without any smell, and of a weak though perceptible taste; its specific gravity is from 1·9 to 2·1. It burns with a pale blue flame, and emits a great quantity of pungent, suffocating vapors. In some parts of Italy and Sicily it is dug up in a state of comparative purity. That which is manufactured in England is obtained by the roasting of pyrites. It is denominated *rough* or *roll sulphur*, from its being cast in cylindrical moulds, and contains 7 per cent. of orpiment. The Italian roll sulphur does not contain more than 3 per cent. of a simple earth; and is, therefore, in higher estimation than the English. When

ro.. sulphur is purified, it receives the name of *sublimed sulphur*, and is in the form of a bright yellow powder. —THOMSON'S *Chemistry*, etc.

Sumatra, the most western of the Sunda islands, Asiatic Archipelago, and, next to Borneo, the largest in the eastern seas, between lat. 5° 40′ N., and 6° S., and long. 95° 20′ and 106° E., separated on the northeast from the Malay peninsula by the Strait of Malacca, having east the Java Sea, and the Strait of Sunda separating it from the island of Java, on other sides the Indian Ocean. Length northwest to southeast 1100 miles; breadth 60 to 240 miles. The area has been estimated at from 128,000 to 130,000 square miles; population 1,437,360, mostly Malays, but partly of the Papuan negro race, with Moors in the northwest, and Dutch and other foreigners. The eastern half of the island is mostly level or undulating, and along the coasts there are many sandy and marshy plains traversed by the Siak, Judrageri, Jambi, Palembang, and other rivers of large size, but which have been little explored by Europeans. Climate in the plains is less oppressive than might have been expected; at midday the thermometer usually ranges between 82° and 85°, sometimes rising to 88°; but at sunrise not more than 70° Fair. Dense fogs, thunder-storms, and waterspouts off the coast are frequent. Much of the island is occupied by dense forests. Products consist of rice, sago, millet, cocoa-nuts, betel, sugar-cane, an abundance of tropical fruits, turmeric, ginger, coffee, ratans, scented wood, teak and other timber, and the European colonists successfully cultivate the vine; but the principal articles of export are pepper to about three million pounds yearly, gold dust, copper ore, sulphur, camphor, in the north; nutmegs, cloves, and mace, in the Dutch territory of Bencoolen; and coral, benzoin, gutta percha, tin, in Palembang and Menankabow; many of which articles are brought by natives from the interior, and bartered at the ports for Indian and European manufactured goods. Iron, coal of an inferior quality, and naphtha, are among the mineral products. The inhabitants build their houses on posts, and adopt other usages of ultra-Gangetic nations; they manufacture gold and silver filagree work with great skill, also silk and cotton fabrics, earthen-wares, arms, and domestic goods generally; from Palembang, lacquered basins, cane boxes, and ratan mats of the best quality are exported to Singapore; and it is said that cannon were formerly cast at Acheen, in the northwest, which territory is, however, peopled by a race of Moorish descent. Imports, besides manufactured goods already mentioned, are opium and salt from India, coarse porcelain, iron wares, gold thread from China, striped cottons, spices, krises and other weapons from Java, Celebes, and other islands of the Archipelago. The island is divided among a number of native states, the chief being Acheen, Menankabow in the central mountain region, Batak, Siak, Jambi, Palembang, Lampong, along the east from north to south, mostly under the supremacy of the Dutch, who possess the settlements of Bencoolen and Padang, on the western coast.

Sumptuary Laws. Laws to restrain excess in dress, furniture, eating, etc. Those of Zaleucus ordained that no woman should go attended by more than one maid in the street, unless she were drunk; and that she should not wear gold or embroidered apparel, unless she designed to act unchastely, 450 B.C. —DIOG. LAERT. This law checked luxury. The *Lex Orchia* among the Romans limited the guests at feasts, and the number and quality of the dishes at an entertainment; and it also enforced that during supper, which was the chief meal among the Romans, the doors of every house should be left open. The English sumptuary laws were chiefly in the reigns of Edward III. and Henry VIII.—*See* DRESS, LUXURY, etc.

Supercargo, a person employed to oversee the cargo or sale of the cargo. The duties of a supercargo are not specially regulated by law, but are dependent upon special agreement between the owners of the cargo and himself. Generally the power of a supercargo does not extend beyond the cargo, the master alone being responsible, and has its limits in the arrival and departure from trading ports. However extended may be the authority conceded to a supercargo, such authority must be subordinate to the common interest of the vessel and cargo. When the powers of a supercargo extend to the navigation of a ship, they must be communicated through the captain, and have reference only to the destination of the ship, and not to the particular management of the ship. Even a supercargo, in cases of necessity, and acting with discretion, may bind the owners of a ship.—POTHIER, *Charte-Partie*; DODSON'S *Admiralty Rep.*, i. 278. *See articles* MASTER, INSURANCE, SHIPPING.

Superior, Lake, the largest sheet of fresh water on the face of the globe, and the most remarkable of the great American lakes, not only from its magnitude, but also from the picturesque scenery of its borders, and the interest and value attaching to its geological features. As a mining region it is one of the most important in this country, and is rich in veins of metallic copper and silver, as well as in the ores of those metals. At the present moment it may be regarded as the most valuable mining district in North America, with the exception only of the gold deposits of California.

This great lake is comprised between the 46th and 49th degrees of north latitude, and the 84th and 92d degrees of longitude, west of Greenwich. Its greatest length is 400 miles; its width in the middle is 160 miles, and its mean depth has been estimated at 900 feet. Its surface is about 600 feet above the level of the Atlantic Ocean, and its bottom is 300 feet below the level of the sea. The ancient French Jesuit fathers, who first explored and described this great lake, and published an account of it in Paris in 1636, describe the form of its shores as similar to that of a bended bow, the northern shore being the arc, and the southern the chord, while Keweenaw Point, projecting from the southern shore to the middle of the lake, is the arrow. This graphic description is illustrated by a map, prepared by them, which displays the geographical position of its shores with as much fidelity as most of the maps of our day, and proves that those early explorers were perfectly familiar with its shores. The coast of Lake Superior is formed of rocks of various kinds and of different geological groups. The whole coast of the lake is rock-bound; and in some places mountain masses of considerable elevation rear themselves from the immediate shore, while mural precipices and beetling crags oppose themselves to the surges of this mighty lake, and threaten the unfortunate mariner who may be caught in a storm upon a lee-shore with almost inevitable destruction. Small coves, or boat harbors, are abundantly afforded by the myriads of indentations upon the rocky coast; and there are a few good snug harbors for vessels of moderate capacity, such as steamboats, schooners, and the like.

The fisheries of Lake Superior are of great value to the people living upon the shores of the lake, and of some importance to the states bordering on the other and lower lakes, and the inland towns near their borders. To the poor Indian the bounties of the great lakes are of vital importance, for without the fish the native tribes would soon perish. Game has become exceedingly scarce in these thickly-wooded regions, only a few bears, rabbits, and porcupines, and some partridges, being found in the woods, and ducks in moderate numbers upon the waters. Agriculture has scarcely begun to tame the wilderness in the vicinity of the copper mines, and the only crops raised are potatoes and a few hardy northern esculents. Small cereal grains—such as oats, barley, and rye—will do well here as in Canada; and Indian corn of the northern varieties, in places not too much exposed to the

chill breezes of the lake, thrives and ripens. English grasses have not yet been cultivated, but they will undoubtedly thrive as well on the south shore of Lake Superior as in New Brunswick and Nova Scotia. The native grasses are abundant and good, but are limited to small natural prairies or to dried-up ponds. The forests are also filled with excellent timber for building purposes; and where the growth is of mixed trees, such as sugar-maple, yellow birch, and pines, the white and yellow pines are of large dimensions, and furnish good lumber.—*See* LAKES, *Commerce of*.

Sweden (*Sverige*), a country of northern Europe, forming the east and larger portion of the Scandinavian peninsula, and one of the kingdoms composing the monarchy of Sweden and Norway; situated between lat. 55° 20′ and 69° 10′ N., long. 11° 15′ and 24° 10′ E., bounded east by the Baltic, the Gulf of Bothnia and Russia, south by the Baltic, west by Norway, the Kattegat, and the Sound. Capital, Stockholm. The soil is not generally fertile, and the corn produced was formerly only about two-thirds of that required; but from the great improvements in agriculture introduced by the government within the present century, and the general introduction of the potato, the produce is now adequate to the consumption. Barley is cultivated as far north as lat. 69°, but the crops frequently fail. Rye, hemp, and potatoes are grown to lat. 66° N. Oats ripen to 63° 30′; wheat and hops cease to be cultivated with advantage beyond lat. 62° N. One-fourth of the surface is covered with forests, but the produce of timber is small; much is used for fuel, and made into charcoal for use in the mines. There are few woods to the north of lat. 64° N. The principal trees are the pine, fir, and birch. Fish are abundant on the coast, and in the lakes and rivers; the herring-fishery has greatly declined, but lobsters are exported, and salmon is caught in all the principal rivers. The mining districts of Sweden, mostly in the central provinces, extend over 16,000 square miles; the chief products are iron, which is distributed over nearly all the country, but the best is found in the län Upsala; the annual produce of all the mines is about 70,000 tons of bar iron. The richest copper mines are at Fahlun; the annual produce in all is about 1000 tons. Gold is not now sought for, and silver is procured only to a small extent. The other mineral products are cobalt, lime, coal of inferior quality, and porphyry. Manufactures are chiefly confined to articles of domestic use; the principal are woolens, sugar, tobacco, paper, linens, cotton (in small quantity); tanning is an important branch of industry. Ship-building is carried on to some extent in the ports of the Baltic. Distilling and brewing are extensively prosecuted. The internal commerce of Sweden is considerable, and Swedish vessels visit most of the Atlantic ports of America, and the Mediterranean. Government is a constitutional monarchy.—*See* NORWAY.

The Swedish monarchy, comprising Sweden and Norway, embraces an area of 292,104 square miles, and contains a population of 4,645,000 inhabitants, viz.:

Sweden.—Area,	170,096	square miles;	population, 3,316,530
Norway.— "	122,008	" "	1,328,470

Sweden and Norway have different constitutions, though they are governed by the same king. Their commercial regulations, their tariffs of duties, their laws and revenues, are all separate. Several treaties of peace, amity, and commerce have been negotiated between the United States and these countries; the latest, that of July 4th, 1827, being based upon the liberal principle of entire reciprocity, as well with Sweden and Norway as with the small but flourishing colony of St. Bartholomew, in the West Indies. The following abstract presents the principal stipulations respecting commerce and navigation:

The citizens and subjects of each of the two high contracting parties may, with perfect security for their persons, vessels, and cargoes, freely enter all the ports, places, and rivers of the territories of the other, wherever foreign commerce is permitted. The vessels of both nations, including those of the island of St. Bartholomew, whether laden or in ballast, to be treated in the ports of each, on their entrance, during their stay, and at their departure, upon the same footing as national vessels coming from the same place, with respect to the duties of tonnage, light-houses, pilotage, and port charges, and all other perquisites, duties, and charges, of whatever kind, levied in the name or to the profit of the government, the local authorities, or any private establishment whatever. All merchandise of every description, no matter of what country it may be the produce or manufacture, that may be imported into either country in national vessels (or into Sweden or Norway in vessels of the island of St. Bartholomew), may in like manner, and without paying other or higher duties or charges, of whatever kind or denomination, be imported in the vessels of the other: full and perfect reciprocity and equality in this respect being established. Similar reciprocity and equality between the vessels of each of the high contracting parties, including those of the island of St. Bartholomew, in respect to exports from either country, is established. This equality with the national flag is applicable to the vessels of the United States proceeding, either laden or in ballast, to the colony of St. Bartholomew, in the West Indies, whether from ports of the kingdom of Sweden and Norway, or from any other place whatsoever, or proceeding from the said colony, either laden or in ballast, whether bound for Sweden or Norway, or any other place whatever. The coasting trade is reserved by each party to its own flag, respectively; the navigation from one port to another in the kingdom of Sweden and Norway, or between these two countries, being considered such coasting trade as respects Sweden. Duties on the navigation between their respective territories, including the island of St. Bartholomew, in the vessels of either, to be no higher or other than those imposed on every other nation; and no prohibitions, restrictions, or differential duties, of any kind or denomination whatsoever, to be established in respect of the products of the soil or industry of either country, including the island of St. Bartholomew, which shall not equally apply to articles of like nature, the growth of any other country. The privileges of transit, and all bounties and drawbacks which may be allowed within the territories of one of the high contracting parties upon the importation or exportation of any article whatever, shall likewise be allowed on the articles of like nature, the products of the soil or industry of the other contracting party, and on the importation or exportation made in its vessels.

The 11th and 12th articles exempt from import and navigation dues (pilotage, wharfage, and light-dues excepted) the vessels of either party arriving in the ports of the other, not wishing to unload any part of their cargoes, or perform any act of trade; and the privilege is mutually conceded to unload in the ports of either such portions only of their cargoes as the captain or owner may wish, and to depart with the remainder, without paying any duties, imposts, or charges whatsoever, except for that part which shall be landed, the proper entries having been made on the vessel's manifest. It is understood, however, that all duties, imposts, or charges whatsoever, which are or may become chargeable upon the vessels themselves, must be paid at the first port where they shall break bulk, or unload part of their cargoes; but that such duties, etc., shall not be paid twice in the ports of the same country which such vessels may afterward wish to enter, unless national vessels be, in such cases, subject to such ulterior duties.

Article 16 stipulates that on direct voyages between the two countries, respectively, a bill of health, granted at the port of departure by an officer having competent power to that effect, will exempt the vessel from any

other quarantine than such as may be necessary for the visit of the health officer of the port where such vessel shall have arrived. Other sanitary regulations are mutually stipulated between the high contracting parties, equally liberal and beneficial to commerce. The treaty of 1783, so far as its stipulations are not inconsistent with the present treaty, is revived; and the usual twelve months' notice, after the expiration of nine years from the exchange of ratifications, is provided for. A separate article reserves, on the part of Sweden, certain commercial privileges to Finland, applicable to the products of that duchy, and of Sweden and Norway, respectively.

The fisheries, the mines, and the forests of this kingdom were the early sources of Swedish commerce. Macgregor, in his Tariff Regulations of Sweden, cites from Puffendorf, one of the counselors of state to the King of Sweden, the following passage, written in 1680, relative to the productions of this kingdom: "Sweden produces more copper and iron than any other kingdom in the world, and the mines are fitted by nature for that purpose, being surrounded by woods and rivers. There is a silver mine in Westmaniand. Finland brings forth pitch, and tar, and deal; and Wermanland [Carlstadt] good store of masts. The native commodities of Sweden are copper, iron, tar, pitch, masts, deals, boards, etc. In lieu of which, Sweden receives from abroad wine, brandy, salt, spices, cloth, silks, and woolen stuffs, fine linen, French manufactures of all sorts, furs, paper, and such like; all which, in some years, surpass in value the commodities exported hence. To recompense this, navigation and commerce has been encouraged of late years among the natives, and several sorts of manufactures are made, whereof those made of copper, iron, and brass would, questionless, turn to the best account, if those artists [blacksmiths and copper-smiths] were duly encouraged to settle in this kingdom."

The general character of the resources and foreign commerce of Sweden has undergone but little change since the foregoing was written. The extent and value have varied somewhat, but by no means in a ratio corresponding with the more enlightened and the more liberal commercial policy of the age. This is mainly owing to the restrictive tariff policy, which still obtains in Sweden, by which duties, equivalent in many cases to actual prohibition, are levied upon many articles of prime necessity, both for immediate consumption and manufacturing purposes.

The following table exhibits the general foreign trade of Sweden during the year 1854, compared with the general result for the preceding years designated:

NAVIGATION OF SWEDEN IN 1854.

Countries.	Arrived.		Cleared.	
	Vessels.	Lasts	Vessels.	Lasts.

" 1840	18,308,000	20,437,000
" 1830	11,160,000	13,337,000
" 1821	11,143,000	12,161,000

The preceding table exhibits the following results:

Increase in 1830 over 1821	1,183,000	rix dollars banco.
" 1840 over 1830	14,268,000	"
" 1846 over 1840	6,735,000	"
" 1847 over 1846	18,480,000	"
" 1854 over 1847	46,287,000	"

Notwithstanding the annual augmentation in the general foreign commerce of Sweden, which the above summary exhibits, the trade with the United States has been marked with but little variation.

The total trade with the United States in 1847, according to Swedish official authorities, amounted in value to 3,341,000 rix dollars banco, or 858,880 rix dollars banco less than 1840, while it exceeded that of 1845 by 779,000 rix dollars banco. In the trade between the United States and Sweden and Norway, there are but comparatively few American vessels employed. The following comparative statements will show the proportion between American and foreign (mostly Swedish and Norwegian) tonnage employed in this trade. A period of ten years, from 1845 to 1854, is selected, as affording a fair average: American tonnage employed in the direct trade between the United States and Sweden and Norway, from 1845 to 1854, 47,038 tons. Average annual tonnage, 4763·8 tons. Foreign (chiefly Swedish and Norwegian) tonnage employed in the trade between the United States and Sweden and Norway, during the above period, 232,089 tons. Average annual tonnage, 23,208·9 tons, or nearly 500 per cent. of foreign over American tonnage annually employed in the trade between the United States and Norway and Sweden. In 1847 the imports of Sweden amounted to nearly 11,160,000 dollars (United States currency). Of this sum Swedish and Norwegian vessels floated nearly nine million dollars, or four-fifths of the whole. The exports reached the sum of $12,276,000, of which the Swedish flag covered over seven and a half millions, or about three-fifths of the whole.

The following are the principal colonial products entering into the imports during 1847, in kilograms of 2·20 lbs. each.

Sugar	kilogs.	8,085,000
Coffee	"	8,035,000
Cotton	"	2,072,000
Tobacco	"	1,212,000
Dye-woods	"	500,000
Wines and spirits	litres.	2,150,000

Of the exports, iron occupies the next rank to timber. The quantity exported in bars reached 82,212,000 kilograms, or about 185,000,000 lbs.

IRON (INCLUDING CAST AND OTHER STEEL) IMPORTED INTO THE UNITED STATES FROM SWEDEN AND NORWAY.

Years.	Cwt.	Values.
1845	272,496	$666,166
1846	256,668	717,116
1847	288,464	609,729
1848	290,082	740,078
1849	295,359	729,206
1850	397,281	1,025,587
1851	409,003	942,961
1852	289,391	773,674
1853	181,040	445,808
1854	208,187	510,221
1855	296,500	814,233
1856	280,690	870,759
1857	238,434	741,446

The value of iron quite equals the entire value of imports into the United States from Sweden for each year during the period specified. The export of iron ore is prohibited. The annual average quantity produced the last five years is estimated at 300,000 tons. The quantity manufactured during the same period is stated to have been 140,000, and 100,000 tons of bar iron. The annual average of the latter exported was 80,000 tons. The average price of pig-iron in Sweden is 8 rix dollars banco the skeppund—7⅓ skeppunds to the ton, or $24 the ton. The iron mines of Sweden belong to joint-stock companies principally. About two-fifths of the pig-iron is purchased and manufactured into bar-iron by iron-masters who own no mines; but the remaining three-fifths are manufactured by the companies that own the mines themselves. The production of pig-iron was formerly limited to a certain specified quantity, whether the capabilities of the mines and miners would admit of more or not. Under this unwise regulation of the government, which it is said was adopted to prevent the exhaustion of the fuel of the kingdom, the coal and forests, the annual production never exceeded 90,000 tons. These limitations have for some years been done away with; nor is there at present any limitation, beyond a matter of form, to the manufacture of bar-iron. The following statement, showing the exportation of iron from 1834 to 1849, is from Swedish official returns:

From 1834 to 1838, annual average	....	79,300 tons.
" 1839 to 1843	"	81,200 "
" 1844 to 1848	"	92,000 "
In 1849	.....	88,500 "

The above exports were destined principally to the following countries, and in annual average quantities as follows:

Great Britain	33,000 tons.
United States	19,850 "
Denmark	8,150 "
France	5,200 "

Small quantities, in the shape of cannon, bomb-shells, etc., are sent to Norway, Holland, and Denmark. The number of blast furnaces in operation in 1850 was 220; of workmen employed in mining the ore, 5241; of mines, 586. The importation of cotton in 1851, according to Swedish official authorities, amounted to 7,989,[illegible] lbs., against 1,832,431 lbs. in 1841, and 794,434 lbs. in 1831. In 1843 these authorities show an importation of 2,600,000 lbs., against 9,883,572 lbs. in 1853, which latter amount exceeded that of the importation of 1852 by 1,247,041 lbs., and that of 1850 by more than 5,200,000 lbs., being the largest of any preceding year. In 1848 the amount was 8,074,020 lbs. The value of cotton manufactures exported to Sweden in 1850 was $46,000, against $7500 only in 1851. It may be well now to inquire into the operation of the tariffs of the two countries respectively upon the leading staples of each, chiefly with a view to ascertain to what extent the importation of such products contributes to the respective customs revenue of each country. The character of the commercial legislation of the two nations, in its effects upon the importation of staple articles of prime necessity, from each into the other, will best show how far the reciprocity stipulated in the treaty of 1827 has been carried into practical operation. This inquiry may lead to useful and obvious suggestions, especially if it results in demonstrating that a positive inequality exists in practice, under which one government derives fully one-fifth of its entire customs revenue annually from a cent-per-cent. duty on a leading staple of the other, without tendering any compensating equivalent for a tax so oppressive.

The importation of unmanufactured American tobacco into Sweden and Norway (including direct and indirect importations) amounted in 1851 to more than 6,500,000 lbs., which, under a duty equal to cent-per-cent. *ad valorem*, paid into the Swedish treasury about $330,000, or one-fifth of the whole customs revenue of the kingdom—and this upon the single article of tobacco; while the entire exports of Sweden and Norway to the United States (amounting to $967,237) paid into the Treasury of the United States, at 30 per cent., but a trifle more than $290,000! In the mean time, nearly 40,000 tons of Swedish and Norwegian shipping were carrying profitable American freights on every sea, while but 4000 tons of United States shipping made single voyages direct to Sweden and Norway. Notwithstanding the most earnest and repeated remonstrances against these unequal restrictions, and this *one-sided* reciprocity, no amelioration has yet taken place in the tariff regulations of Sweden. It is true, some reductions have been admitted in the tariff of 1852 on certain articles which enter into American exports. The duties upon coffee, sugar, arrack, and undressed hides were severally reduced 33⅓, 25, 12½, and 8⅓ per cent., and upon rice in the husk, or paddy, 16⅔ per cent. But these concessions were clogged to such an extent by the repeal of the 24th article of the tariff of 1849, that American commerce, so far from gaining any advantage by them, will be found, by the simple process of striking a balance between the results of the reductions and of the repeal, to be subjected to new and oppressive burdens. The 24th article, or the differential clause, appended to the tariff of 1849, reduced the duties upon certain merchandise imported and exported in Swedish or Norwegian vessels, as follows: Swedish vessels navigating to distant countries will continue to enjoy the advantage of the following reduction in duties of customs and convoy imposts, viz.:

Of 15 per cent. on the produce and manufactures of countries situated on the continent of America north of the 25th degree of north latitude, or of any of the foreign colonies in the West Indies, if imported direct from thence in Swedish ships; and of the like reduction on Swedish produce and manufactures exported direct to foreign colonies in the West Indies.

Of 25 per cent. on Swedish produce and manufactures exported in Swedish ships direct to the island of St. Bartholomew, to places on the east coast of the continent of America south of the 25th degree of north latitude, or to the Cape of Good Hope; and the like reduction on the produce and manufactures of those countries imported direct into Sweden in Swedish vessels.

Of 33⅓ per cent. on Swedish produce and manufactures exported in Swedish ships direct to places on the other side of the Cape of Good Hope, as also to ports on the other side of Cape Horn; and on the produce and manufactures of those ports and places imported from thence direct in Swedish ships. Under the treaty, these privileges apply equally to American vessels.

The effect of the repeal of this article is, that every thing imported from America, except the articles above enumerated, has been chargeable since 1st of January, 1853—the day when the repeal took effect—with duties 15 per cent. higher than before that period. The repeal of this clause was granted as a concession, to silence the united and vigorous remonstrances of England and Holland against the operation of the Swedish tariff regulations. On the article of tobacco alone the commerce of the United States is burdened with additional duties amounting to $35,000 per annum—enough to affect materially the sale of this American staple in the markets of that country; and a trifling reduction of

duty upon rice is the only acknowledgment which the government of Sweden has yet made of the injustice of these oppressive restrictions. The following table exhibits the working of the existing treaty between the United States and Sweden during the years 1845, 1846, 1847, 1848, and 1849, so far, at least, as it relates to the commerce between the two countries. It is translated and compiled from Swedish official publications:

IMPORT AND EXPORT TRADE OF SWEDEN WITH THE UNITED STATES DURING THE YEARS SPECIFIED.

Years.	Imports.		Exports.	
	By American Tonnage.	By Swedish Tonnage.	By American Tonnage.	By Swedish Tonnage.
	Per Cent.	Per Cent.	Per Cent.	Per Cent.

In 1849	17,000	"

SWEDISH TONNAGE ARRIVED AT EUROPEAN PORTS FROM THE UNITED STATES.

In 1845	60,000	tons.
In 1846	56,000	"
In 1847	60,000	"
In 1848	53,000	"
In 1849	64,000	"

According to the laws of Sweden, each triennial Diet proposes a new tariff, which is designed to remain in force three years; the king having, in the mean time, constitutional power to lower, but not to raise, any duties whatever, provided a certain sum be obtained from the customs. The tariff of 1852 continued in force until January 1, 1855. In the Diet of 1854 many important reductions were recommended by the committee on revenue, but they declined recommending any precise change on tobacco duties. They referred this subject to the king, to whom a recommendation was made to enter into negotiations with foreign governments, with a view to obtain reductions upon Swedish produce in exchange for lighter tobacco duties. These negotiations were understood to refer chiefly to iron duties in the United States. Among the reductions proposed by this committee are the following:

Indian corn to be reduced from 40 to 10 cents per barrel.
Cotton thread, from 20 to 13 cents per pound.
Wool, from 5 cents to 1½ cent per pound.
Dye-woods, from 1 per cent. ad valorem to free.
Rope, from 20 to 13 cents per 18½ lbs.
Salt, from 30 to 14 cents per barrel.
Copper, raw, from $2 to 40 cents per 375 lbs.
Copper, refined, from $3 to $1 60 per 375 lbs.
Copper plates, from $13 35 to $9 70 per 375 lbs.
Steam-engines, from 20 and 10 per cent. to 5 per cent. ad valorem.
Tools and machinery, not specially enumerated, from 25 to 5 per cent. ad valorem.

The alterations recommended by this committee were generally adopted. After January 1, 1856, the articles prohibited by the tariff of 1855 are to be admitted at a duty equal, generally, to 25 per cent., except gunpowder, pig-iron, and certain kinds of brandy. Tobacco remains as under the tariff of 1852, and will doubtless be reserved as a basis for such negotiations as the Swedish government may have in contemplation relative to iron duties in the United States. The principal reductions, though not of great importance to American commerce with Sweden, apply to fire-arms, cheese, printed cotton, undyed cotton, yarn, codfish (dried and salted), logwood (made free), Indian corn (committee's recommendation adopted), salted meat, smoked or dried do., spermaceti candles (reduced 50 per cent.), rosin (do.), rice.

DESCRIPTION AND QUANTITIES OF CERTAIN MERCHANDISE IMPORTED INTO SWEDEN IN THE YEARS 1851 AND 1852.

Articles.		1851.	1852.
Sugar, loaf.....	pounds	54,509	821,893
" other kinds.	"	24,700,329	25,045,752
Coffee.....	"	9,013,934	10,373,004
Cotton.....	"	7,989,428	8,036,581
Tobacco stems.....	"	1,448,187	1,858,688
Wines and spirits..kanna		200,633	312,155

Besides the articles above specified, the returns for 1852 show an increase over 1851 in the following descriptions of merchandise, viz.:

Articles.		1851.	1852.
Cotton yarn.....	pounds	662,993	1,240,783
Hides.....	"	3,061,574	3,410,422
Linseed-oil.....	"	492,914	1,109,130

Cast steel.....	"	26,238	54,053
Sulphuric acid.....	"	189,225	190,834
Soap.....	"	140,408	132,250

The principal articles of which the importation in 1852 was less than that of 1851 were cocoa, fish (dried and smoked), salt, cheese, spirits of turpentine, tobacco (leaf and cut), fish-oil, wool, etc.

The exports of articles of domestic produce from the United States to Sweden and Norway for the year ending June 30, 1857, may be thus divided: Cotton, $1,249,042; tobacco, $84,871; other articles, 39,393—total, $1,373,306.

The navigation returns for 1852 show a total of 7803 vessels entered, with an aggregate of 343,693 lasts. Of the total number of vessels, there were Swedish 4154, measuring on aggregate of 133,963 lasts; 1288 vessels, carrying in all 109,272 lasts, under the Norwegian flag; 550 vessels of 34,025 lasts, belonging to Finland; and 1311 vessels, measuring 66,433 lasts, under foreign flags.—*Com. Rel. U. S.*

Principal Ports.—Gottenburgö, or more properly Göthaborg, on the southwest coast of Sweden, bordering the Cattegat, near the mouth of the River Gotha, lat. 57° 42′ 4″ N., long. 11° 57′ 45″ E. Vessels do not come up close to the city, but lie in the river or harbor, at a short distance from the shore—goods being conveyed to and from them by lighters. The depth of water in the port is 17 feet, and there is no tide, bar, or shallow.

Stockholm, the capital of Sweden, situated at the junction of Lake Mœler with an inlet into the Baltic. The entrance to the harbor is intricate and dangerous, and should not be attempted without a pilot; but the harbor itself is capacious and excellent—the largest vessels lying in close to the quays.—*See* STOCKHOLM.

Bergen, the first commercial city of Norway, situated at the head of a deep bay, in lat. 60° 24′ N., and long. 5° 20′ E. The bay is inclosed on all sides by rugged rocks and islands; the water is deep, but the entrance to the town is difficult, and needs a pilot.

Manufactures.—The value of manufactures of all kinds at registered factories was: In 1839, $5,439,123; in 1846, $7,084,947; In 1848, $8,868,348; in 1849, $9,299,899; in 1850, $9,891,072; in 1851, $9,913,866, showing an increase since 1839 of $4,474,743; since 1846, of $2,828,919; and since 1849, of $673,967.

* Nine months to June 30, and the fiscal year from this time begins July 1.

The importation of raw cotton into Sweden in 1851 amounted to 7,989,428 lbs., being larger than the importation of the previous year by 3,838,588 lbs. It was, moreover, the largest quantity ever imported in a single year, except in 1848, when the amount was 8,074,020 lbs. In 1831 the amount imported was 794,434 lbs., and in 1841, 1,832,431 lbs. The amount of cotton twist produced in Sweden in 1851 was 6,005,081 lbs. (chiefly No. 26), and was valued at $1,311,777. In 1850 the quantity was 5,734,332 lbs., and the value $1,279,960. The amount of cotton cloth manufactured in 1851 was 1,730,000 English yards, and the number of people employed in registered cotton factories was over 3000. In 1850 the value of exported cotton manufactures was $46,000. In 1851 it decreased to $7500. In 1850, imported cotton cloth, 170,000 lbs.; imported cotton twist, 893,000 lbs.: total, 1,063,000 lbs. In 1851, imported cotton cloth, 195,500 lbs.; imported cotton twist, 1,068,000 lbs.: total, 1,263,500 lbs. Tobacco was imported in 1851 into Sweden to the amount of 4,141,509 lbs., of which only 42,642 lbs. were manufactured. Of the whole amount 2,567,982 lbs. came direct from the United States; the remainder chiefly from German ports. In 1850 the importation was 3,370,399 lbs.; 41,795 lbs. manufactured. At 79 tobacco manufactories in the kingdom there were employed, in 1851, 1277 workmen, and the sales were valued at $647,120; consisting of 200,175 lbs. of cigars, 2,750,723 lbs. of snuff, and 1,632,555 lbs. of other prepared tobacco; in all 4,583,453 lbs. Tobacco, in small quantity, and of very bad quality, is grown in the neighborhood of Stockholm, but I believe in no other part of the kingdom. It should be remembered that the accompanying table and the foregoing notices of Swedish woven goods refer only to the registered factories, and do not exhibit half of the actual manufactures of the kingdom. None of the homespun cloths are included, for which, of every description, the Swedish peasantry are remarkable, and of which, unfortunately, it is impossible to obtain exact accounts of the value or quantity. The province or county most distinguished for these productions is that of Elfsborg, of which Gottenburg is the market. The home-made manufactures of this province, over and above the amount consumed by its own inhabitants, were, in 1850 and 1851 (inclusive of stockings, quilts, and ribbons), as follows:

1850—Cotton stuffs	4,842,000	English yards.
" Linen stuffs	275,200	"
" Woolen stuffs	392,170	"
" Cotton handkerchiefs	1,448,928	pieces.
1851—Cotton stuffs	4,752,600	English yards.
" Linen stuffs	270,800	"
" Woolen stuffs	340,161	"
" Cotton handkerchiefs	1,065,261	pieces.

These quantities have slightly diminished of late years, and the registered factories are accordingly encouraged.

The homespun manufactures of Gefleborg which were sold in 1849 amounted to 1,428,883 yards; those of Westmoreland to 805,333 yards; and those of Holland to 162,700 yards.

The productions of other provinces are not given reliably; but enough is known to prove that the amount of such fabrics is considerably greater than that of the registered manufactures; and their productions, especially of linen cloth, surpass in durability, and rival in fineness, the best productions of the factories.

The value of manufactures of all kinds at registered factories was: In 1839, $5,439,128; in 1846, $7,064,947; in 1850, $9,891,072; in 1853, $10,151,724; in 1854, $11,841,613; and in 1855, $14,437,645. It will be seen, therefore, that the increase in ten years has been nearly $7,000,000 (100 per cent.), and in twelve months $2,500,000. The importation of raw cotton into Sweden in 1855 reached to 14,783,529 lbs.; in 1853 the

amount was 9,883,572 lbs.; in 1848, 2,600,000 lbs.; in 1831, 794,484 lbs.; showing an increase in twelve years of more than 12,000,000 lbs. The amount of cotton twist produced in 1855, chiefly of a quality under "No. 26," was 10,598,098 lbs., valued at $2,168,625, exceeding the amount of the preceding year by 2,893,823 lbs. The amount of cotton cloth produced does not appear to have been ascertained, as the official report gives the amount indiscriminately with linen. Their joint value in 1855 was equivalent to $652,489, nearly twice greater than in 1853. In 1845 their value was $188,787. The importation of unmanufactured tobacco into Sweden in 1855 amounted to 4,532,616 lbs., being 573,626 lbs. more than in 1854. In 1853 the amount was 4,851,722 lbs. The importation of manufactured tobacco in 1855 was 55,205 lbs., somewhat more than 10,000 lbs. less than in 1853. Considerably more than half the tobacco consumed in Sweden is imported directly from the United States. The amount directly from the United States in 1853 was over 3,100,000 lbs. The accompanying table is necessarily confined to the returns of registered factories, and, unfortunately, exact accounts of homespun fabrics, for which this country is remarkable, can not be had. The province most distinguished for these productions is that of Elfsborg, adjoining the province of Gottenburg. In Elfsborg it appears that in 1855 the home-made goods, over and above the quantity consumed by its own inhabitants (about 250,000 souls), amounted to 9,047,506 English yards of cotton cloth, together with 1,568,556 cotton handkerchiefs. Also, linen fabrics, 259,329 English yards; woolen fabrics, 392,425 English yards; showing an increase in cotton weaving since 1853 of more than 3,300,000 English yards. In the province of Gefleborg there were woven by the peasants, in their homes, no less than 2,077,000 ells (or 1,384,666 English yards) of heavy linen. Other districts also are almost equally distinguished for cotton and linen homespun fabrics of excellent quality.

REVIEW OF SWEDISH REGISTERED MANUFACTURES IN 1855, THEIR VALUES, NUMBER OF OPERATIVES, AND NUMBER OF ESTABLISHMENTS.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Swedish West Indies.—The island of St. Bartholomew is the only possession of the Swedes in America. It belongs to the leeward group, and is situate centrally in lat. 17° 50′ N., and long. 62° 52′ W., distant 12 miles from St. Martin, and about 30 from St. Christopher. It is about 8 miles long, by from 2 to 3 miles wide, and contains an area of about 25 square miles. Capital, Gustavia. The island is of an irregular shape, and deeply indented by numerous small sandy bays, separated by bold and steep rocky acclivities of moderate height. In the interior it is hilly, but its loftiest elevations are less than 1000 feet. In most parts it is barren and sterile, but has numerous well-cultivated valleys. It produces all the staples of the West Indies—cotton, sugar, tobacco, indigo, etc., and also lignum vitæ and iron wood. Its only exports are cattle and some salt. Water is scarce, and the inhabitants depend for supply on the rains. The only harbor is La Carenage, a safe and commodious one, and much frequented. It is on the west side of the island. Close by is Gustavia, the principal town, a thriving place, having considerable commerce with the neighboring islands. The population is estimated at between 8000 and 9000, of which two-thirds are blacks. The slaves were emancipated on the 9th of October, 1847, and on this occasion the negroes tendered to the King of Sweden an address of thanks. St. Bartholomew was settled by the French in 1648, and was ceded to the Swedes in 1784, with whom it still remains.

Swedish vessels from the island of St. Bartholomew are placed on an equal footing with those of the United States by the treaty with Sweden and Norway of July 4, 1827.—*See* TREATIES, COMMERCIAL.

Switzerland (Ger. *Schweitz*; Fr. *La Suisse*; It. *La Svizzera*), a country of Central Europe, between lat. 45° 50′ and 47° 50′ N., and long. 5° 55′ and 10° 30′ E., having east the principality of Lichtenstein and the Tyrol, south Lombardy and Sardinia, west France, north and northeast Baden, Würtemberg, and Bavaria. Length 216 miles, breadth 75 to 140 miles. At an elevation of from 1000 to 1600 feet, the climate is pure and salubrious; but it is unhealthy in many of the deep and narrow valleys. Vegetation corresponds with the extremes of climate. In the Valais the fig and grape ripen at the foot of ice-clad mountains, while near their summits the rhododendron and the lichen grow at the limit of the snow line. The corn raised in Switzerland is not nearly sufficient for the supply of its population; the most productive cantons are those of the north and west. Here the vine ripens at an elevation of 1900, and in some places at 2100 feet above the sea. It is cultivated on the slopes of the Jura, and in the valleys of the Rhine, Rhone, Reuss, Limmat, and Thur. Buckwheat ripens at an elevation of 2200, and with a southern exposure at 3000 feet; barley, rye, potatoes, and pot herbs at 4000 feet. Flax and hemp are extensively grown; irrigation is judiciously managed; and, in general, agriculture is making considerable progress. The slopes of the Jura and of the Alps, and the high regions of the table-land, are covered with valuable timber trees—the oak, beech, larch, and birch. The pine grows to an elevation of 6700 feet, shrubs to 7400. The great wealth of Switzerland consists in its rich and excellent pastures, which in summer support vast numbers of cattle; the finest breeds are those of the Simmenthal, Gessenay, Gruyere, Zug, and Schwytz. The cultivation of the vine is an important branch of industry in the southwest cantons, and wine is exported. *Kirschwesser*, cider, and perry are made. Cheese is a valuable product; it is made chiefly in Gessenay, the Simmenthal, and the Emmenthal; that called Gruyere is much esteemed and extensively exported.

Switzerland has made rapid progress in manufacturing industry. The east and northeast cantons manufacture cotton goods, the chief seats of which are Appenzell and St. Gall. Silks are woven in Zurich and Basle, and linens at Bern. Neufchatel has superior printing establishments. Watches, jewelry, and musical boxes are the principal manufactures of the west cantons; here 230,000 watches are made every year. The number of individuals employed in the different branches of industry in 1846 were: Silks, 40,000; cottons, 90,000; watches and jewelry, 30,000; woolens, paper, leather, iron wares, etc., 40,000; in all, 200,000.

Switzerland contains a population of 2,390,116, and embraces an area of 15,261 square miles. Politically it is divided into twenty-two cantons, as follows:

Cantons.	Square Miles.	Population.
Appenzol	153	54,809
Aargau	508	196,720
Basle	185	73,385
Bern	2,567	457,921
Freyburg	505	99,805
St. Gall	749	169,508
Glarus	280	30,197
Geneva	91	63,032
Grisons	2,975	89,840
Lucerne	588	132,789
Neufchatel	281	70,679
Schaffhausen	116	35,278
Schwyts	339	44,159
Soleure	225	69,613
Ticino	1,087	117,397
Thurgau	379	88,810
Unterwalden	393	25,135
Uri	422	14,500
Valais	1.665	81,927
Vaud	1,185	199,453
Zug	85	17,456
Zurich	687	250,134
Total	15,261	2,390,116

A more moderate tariff than that now levied in Switzerland upon our principal staples could not be desired. For instance,

Grain of every kind pays a duty of only 3 cents per 110½ lbs.	
Rice, 3 cents	"
Salted provisions, 65 cents	"
Lard, 65 cents	"
Dried vegetables, 3 cents	"
Whale oil, 6 cents	"
Whalebone, 65 cents	"
Tobacco, 65 cents	"
Wool, raw or combed, 6 cents	"
Pot and pearl ashes, 6 cents	"
Rosin, 6 cents	"
Tallow, 6 cents	"

The commercial relations between the United States and Switzerland are regulated by treaty, exchanged November 8th, and proclaimed November 9th, 1855. Article 1 places citizens of either country residing in the other upon a footing of equality with native citizens, subject to the constitutional and legal provisions, as well federal as state and cantonal, of the contracting parties. Article 7 provides for the appointment and powers of consuls and vice-consuls in the large cities and important commercial places, in the countries of the contracting parties respectively. Article 8 provides that in all that relates to the importation, exportation, and transit of their respective products, the United States of America and the Swiss confederation shall treat each other reciprocally as the most favored nation: thus, neither of the contracting parties shall impose any higher or other duties upon the importation, exportation, or transit of the natural or industrial products of the other than are or shall be payable upon the like articles, being the produce of any other country, not embraced within its present limits. Article 10 provides that neither of the contracting parties shall grant any favor in commerce to any nation, union of nations, state, or society which shall not immediately be enjoyed by the other party. Article 11 provides that each country shall be at liberty to determine the manner of establishing the origin of its own products destined to enter the country of the other, should differential duties be established by either on the products of any nation. Article 12 provides that the territories and ports of each country shall be open to the admission of articles from the other; such articles, when imported into the United States under the national flag, or under that of one of the nations most favored by

them, shall pay the same duties as the merchandise of such nation; under any other flag it shall be treated as the merchandise of the country to which the vessel belongs. The remaining articles relate to the extradition of criminals.

By a provision of the Swiss constitution of 1848, raw materials required for manufactures, as well as for the necessaries of life, are to be admitted at the lowest possible rate of duty, while the highest import tax they can bear is to be levied upon articles of luxury. In all the other governments of Europe, if we except the Hanse Towns, tobacco is considered as an article of luxury; and it might be added, in behalf of France and England, as an article of convenience, also, for raising revenue. In these countries it is, consequently, subjected—in the former to the arbitrary exactions of the *regie*,* and in the latter to such duties as are almost equivalent to a prohibition. In Switzerland, however, whatever may be the light in which they view tobacco, whether as an article of luxury or of necessity, it is treated as an article of *trade*, and admitted at a rate of duty less for 110½ lbs. than Great Britain charges on the single pound. The effect of this liberal treatment of one of our leading staples is seen in the disproportional quantities, relatively to population, which are sent to these different countries. For example: France, with a population of 36,000,000, received an annual average of 15,000,000 lbs. of American tobacco during a period of three years (1851, 1852, and 1853), which gives about one-third of a pound to each person. Great Britain, with a population of 27,000,000, received an annual average, the same period, of 25,000,000 lbs., or nearly one pound per head; while Switzerland, with a population of 2,400,000, received more than 7,000,000 lbs., or some three pounds for each person.

The manufactures of Switzerland are the chief basis of its trade with foreign countries. As early as the 14th century Zurich became the great emporium and market for Italian products and industry; and Schwytz and Unterwalden, which, with Zurich, constituted the three original cantons, were at that period famed for their ingenious and industrious habits. The principal seats of Swiss manufactures at the present day are:

The canton of Neufchatel for printed cottons, lace, jewelry, clocks, watches, and various minor articles. Wine and cheese are also produced in this canton. Geneva for watches,† clocks, jewelry, musical boxes, enameled articles, philosophical instruments, tools, cutlery, fire-arms, etc. Zurich, Aargau, and Thurgau chiefly for cotton and silk manufactures, woolen goods, straw platting, linens, and various minor articles. St. Gall and part of Appenzel for linens, muslins, cambrics, embroidery, tambouring, etc. Basle chiefly for silk ribbons, having upward of 4000 looms employed in their manufacture. The raw materials for these manufactures are greatly enhanced in price by the expense of carriage (*transit*); and bread, flour, and other articles of food cost higher than in most other countries of Europe. The restrictions on transit through France and other adjacent countries are a heavy drawback upon the industry of Switzerland; but the proverbial frugality of the people, and the low price of labor, together with the admitted superiority of most of their manufactures over those of England and France, enable them to compete successfully with those countries in foreign markets.

The commerce of all nations enjoys equal privileges in Switzerland, but the federal council is empowered to adopt immediate measures in case the commerce of Switzerland is subjected to any extraordinary restrictions in other countries; notifying, however, such measures to the next succeeding federal assembly. Consumption duties are levied in eighteen cantons; but as they apply to only two articles—namely, wines and alcoholic liquors, neither of which the United States exports to that country—it is deemed needless to specify them. The suppression of these duties, however, affecting as they do one of the staples of France, might be compensated by a melioration in the laws applicable to the transitage of Swiss manufactures across the territories of France—a result which would prove highly advantageous to the commercial relations between the United States and Switzerland.

The whole foreign commerce of Switzerland during the year 1840 amounted to about 460,000,000 francs, or $85,000,000. Several causes have combined to develop and promote the industrial and commercial prosperity of Switzerland. In a mountainous country, covered with snow during six or eight months in the year, the inhabitants have recourse to in-door labor as a matter of necessity. Besides, their position in the centre of Europe, surrounded on all sides by manufacturing communities, stimulates their emulation, encouraged as it is by the facilities which the adjacent markets afford for the supply of raw materials. The people, at once agriculturists and artisans, and naturally industrious, find ample scope for constant and profitable employment in these two occupations, and are thus enabled to live on moderate wages. These causes have contributed to the most remarkable development of industrial pursuits, especially in the northern and western cantons. Without dwelling upon minute details in regard to the different branches of manufactures into which this mechanical industry has entered, the extraordinary success of cotton manufactures in Switzerland will be briefly considered, as necessarily bearing upon the consumption of one of the leading staples of the United States. There is, moreover, no branch of industry which more forcibly illustrates the energy and mechanical genius of the Swiss than their cotton manufactures. In 1830 the republic had in operation 400,000 spindles; in 1840, 750,000; and in 1850, 950,000; the number having more than doubled in twenty years. The cotton-spinning factories in the year last named were 200, estimated to produce annually from 18,000,000 to 20,000,000 lbs. of yarn. This progress in cotton manufactures is the more surprising, because of the heavy expense with which the raw material is burdened by transit tolls before it can reach the territory of Switzerland. The quantity passed in transit from Havre for Switzerland in 1833 and 1834 was nearly 6,000,000 lbs.; in 1843 it reached nearly 17,000,000 lbs., and constituted four-fifths of all consumed during that year in Switzerland. The entire receipt of cotton that year is put down at 22,000,000 lbs.

The following table exhibits the total quantity of raw cotton which passed through Havre in transit for Switzerland during a period embracing thirteen years:

Years.	Kilograms.	Years.	Kilograms.
1833	2,638,000	1840	4,912,000
1834	4,296,000	1841	7,307,000
1835	4,362,000	1842	9,836,000
1836	6,486,000	1843	7,622,000
1837	5,493,000	1844	7,440,000
1838	7,120,000	1845	9,431,000
1839	4,475,000		

In 1851 the importation of cotton into Switzerland amounted to 27,035 [illegible] lbs., of which 18,729,820 lbs. were from the United States. According to the *Tableau Général* of France for the years designated, Switzerland received cotton in pounds as follows, in 1851, 1852, and 1853:

	1851.	1852.	1853.
Through France	15,816,751	15,815,473	14,978,257
Of which from the United States	15,812,161	15,765,550	14,879,331
From other places	4,590	49,917	98,926

A severe restriction on the importation of cotton, and also of tobacco, to Switzerland, as well as on the reception by the United States of Swiss wares and manufactures in return, is, as already mentioned, the

* For an explanation of this term, see *Digest of France*, p. 198.

† It is estimated that from Geneva alone 240,000 watches are annually shipped, *via* Havre, to the United States.

vexatious and expensive transitage, specially through France. The oppression of this burden may be inferred from the fact that the annual average aggregate value of merchandise on which transit tolls are paid, proceeding from Switzerland, was in 1853 nearly $30,000,000; and the value of that proceeding to that republic more than half as much.

Switzerland sent in transitu to France, cotton tissues to the value of nearly $3,000,000 in 1852, and to the value of nearly $4,000,000 in 1853. By the French tariff such fabrics are excluded from France for consumption. Since 1845, Switzerland, it is stated officially, has quite superseded, in the markets of Germany and Austria, the yarns of Great Britain.

The following statement shows the quantities of cotton received by Switzerland from the United States, and of cotton stuffs sent to the United States from Switzerland, made up from Swiss official sources:

COTTON FROM THE UNITED STATES TO SWITZERLAND.

1850	15,942,740 lbs.	1852	19,065,900 lbs.
1851	13,729,320 "	1853	18,441,830 "

COTTON STUFFS FROM SWITZERLAND TO THE UNITED STATES.

1850	3,226,300 lbs.	1852	4,077,920 lbs.
1851	5,509,660 "	1853	5,265,150 "

In 1855 Switzerland returned to the United States, in exchange for raw cotton, the same article manufactured, to the value of $212,700.

In this branch of industry Switzerland is said to compete successfully with France. Her chintzes, and also her embroidered mousselines, are superior to those of Alsace; and if the French markets are closed against their admission under the operation of restrictive tariffs, they find an ample outlet in the Levant, or across the Austrian territory by the Danube. They also find markets in North and South America, the Barbary States, the East and West Indies, in the fairs and markets of Central Germany, as well as in the entrepôts of the Hanse Towns. The manufacture of tobacco in Switzerland is stated to employ 4000 persons, and to produce about 9,000,000 pounds, valued at $1,116,000. There is imported of the article annually into Switzerland, and produced in the country, as follows:

Imported	7,031,502 lbs.	Value	$436,728
Produced	800,000 "	"	24,626
Total	7,831,502 "	"	$461,354*

Of this there is consumed in Switzerland 6,740,502 lbs., of the value of $558,000; leaving for exportation 1,091,000 lbs.; and if to the value which this latter amount represents to the manufacturer be added wages of hands and other expenses of manufacturing, it is estimated that the raw tobacco costs the Swiss manufacturer about six cents per pound, while he expects to realize from the sale of the manufactured article about 72½ cents per pound.

TOBACCO IMPORTED INTO SWITZERLAND DURING A SERIES OF YEARS.

1847	lbs.	2,696,712
1848	"	3,376,804
1849	"	5,428,150
1851	"	7,264,957
1852	"	7,166,912

As American products generally reach Switzerland *via* Havre, the following table is subjoined, exhibiting the transit trade between France and Switzerland during a period of eight years, ending with 1853:

Years.	From Switzerland	To Switzerland.
1846	$13,774,000	$10,416,000
1847	14,430,000	9,300,000
1848	16,182,300	9,114,000
1849	18,600,000	10,602,000
1850	18,414,000	8,928,000
1851	18,225,000	8,928,000
1852	18,736,000	11,346,000
1853	26,598,000	10,788,000

It may be inferred from the above statement that the chief obstacle to trade between the United States and Switzerland is found in the restrictions of transitage, especially over the territories of France. If Swiss manufacturers could have their goods destined for the United States finally examined and sealed (*plombé*) at the first French frontier custom-house, then to pass on to their final destination under the protection of that seal, unopened, and consequently exempt from the re-examination and repacking which they undergo at each post, it is believed that the trade with the United States would all pass through Havre, instead of seeking, as is the case at present, the more circuitous and expensive routes *via* Liverpool and other ports. Such a change in the French transit regulations would result, also, in an annual augmentation in the general exchanges between the United States and Switzerland. Commercial returns from Switzerland are necessarily imperfect, owing to the difficulty in procuring requisite statistics from the various ports through which Swiss merchandise reaches the United States. The exports which passed through the consular district of Basle during the last six months of 1854 for the United States, amounted to $728,689 35. The total value of merchandise that passed through the consulate at Zurich for the United States was:

In 1853	$3,800,698
In 1854	4,406,072

The following statement shows the values of the goods, wares, and merchandise sent from Switzerland to the United States, covered by invoices authenticated at the consulate of Basle, for the six months ending July 1st, 1855:

Silk goods	$386,856 09
Watches and jewelry	89,067 62
Cotton	24,272 11
Straw	11,706 17
Medicines	3,696 20
Cheese and spirits	3,161 26
Silk and woolen	12,361 95
Paper-hangings	2,980 56
Leather	338 25
Mathematical instruments	356 67
Cloth	684 50
Machinery	81 40
Wooden ware	23 06
Cutlery	81 43
Total	$537,614 53

The following table exhibits the value of imports, the produce and manufacture of Switzerland, into the United States, during the years ending June, 1853, and 1855; to which is added a statement showing the ports from which said imports were cleared, with the amounts for each, made up from United States official authorities:

VALUE OF PRINCIPAL IMPORTS, THE PRODUCE AND MANUFACTURE OF SWITZERLAND, INCLUDED IN THE IMPORTATIONS FROM THE HANSE TOWNS, HOLLAND, BELGIUM, FRANCE, AND ENGLAND, DURING THE YEARS ENDING JUNE 30, 1853, AND JUNE 30, 1855.

Description of Merchandise.	Values. 1853.	Values. 1855.
Manufactures of wool	$15,932	$60,526
" cotton	323,632	242,700
" silk, etc.	3,301,896	4,346,534
" flax, linens, etc.	3,352	....
" iron and steel	19,062	28,426

France	2,637,877	3,701,004
England	2,156,824	3,405,266
Total	$5,592,984	$7,178,139

Imports from the United States into Switzerland are made, for the most part, through the customs frontiers of Bern, Soleure, Basle, and Aargau, bordering on France and the southern part of Germany. Swiss statistics, especially such as relate to commerce, are so far behind those of other European governments, owing mainly to the geographical position of Switzerland, that an approximation only to fixed facts is attempted in the following tables, designed to illustrate the preceding summary of the trade between the two countries.

COMMERCE OF THE UNITED STATES WITH SWITZERLAND, EMBRACING THE AMOUNTS OF THE PRINCIPAL IMPORTS AND EXPORTS.

IMPORTATIONS INTO SWITZERLAND FROM THE UNITED STATES.

Denomination of Merchandise.	1851.	1852.	1853.
	Centners.*	Centners.	Centners.
Cotton	124,512·4	173,320	107,653

Watches, including music-boxes	551·6	342	467
Wooden manufactures	1,359·5	1,942	1,052

The trade between the United States and Switzerland is gradually on the increase. American flour, which, prior to 1847, never reached that country, is in common use now, and if reduction can be obtained on the expense of transportation through France, or on the Rhine, it may in time become as much in use as that obtained from the Baltic. During the year 1853 the following amounts of Swiss manufactured articles were exported to the United States, the papers of which passed through this consulate, nine-tenths of which were manufactured alone in the Canton of Zurich, which contains a population of but 250,000:

Silk goods, amounting to	19,312,050	francs.
Cottons (mostly from Canton St. Gall)	703,812	"
Straw goods	72,930	"
Catholic books, from Convent Einsiedel	18,065	"
Cheese	8,845	"
Calf-skins, etc.	16,779	"
Making a grand total of	20,133,500	francs.

—*Com. Rel. U. S.*

Swords were originally formed of iron taken from a mountain by the Chinese, 1879 B.C.—*Univ. Hist.* The sword was one of the earliest implements of war. The Roman swords were from twenty to thirty inches long. The broadsword and cimeter are of modern adoption. The sword of state was carried at an English king's coronation by a king of Scotland, 1194. Damascus steel swords are highly prized, and next the sword of Ferrara steel. The Scotch Highlanders were accustomed to procure the latter from the celebrated artificer named Andrea di Ferrara, and used to call them their *Andrew Ferraras*. The broadsword was forbidden to be worn in Edinburgh in 1724.—HAYDN.

* The Swiss centner is equivalent to 110¼ lbs.

Sydney, the capital of New South Wales, and of the British settlements in New Holland, or Australia, on a cove on the south side of Port Jackson, about seven miles from its mouth, lat. 33° 55′ S., long. 150° 10′ E. Population in 1846, 38,358, and now (1853) estimated at above 50,000. Owing to a want of attention at first, the streets of Sydney were laid out, and the houses built, according to the views of individuals, without any fixed or regular plan. But latterly this defect has been to a considerable degree remedied in the old streets; and the new ones are systematically laid out. The town covers a great extent of land, almost every house having a considerable piece of ground attached to it. Schools for the instruction of poor children have been established, and there are, besides two establishments dignified with the pompous title of colleges, numerous seminaries, some of them said to be very well conducted, for the education of the middle and upper classes. There are several newspapers and other periodical publications.

Sydney is admirably adapted for the capital of a great trading colony. Port Jackson is one of the finest natural basins in the world. It stretches about fifteen miles into the country, and has numerous creeks and bays; the anchorage is every where excellent, and ships are protected from every wind. The entrance to this fine bay is between two gigantic cliffs, not quite two miles apart. On the most southerly, in lat. 33° 51′ 30″ S., long. 151° 16′ 30″ E., a light-house has been erected, the lantern of which is elevated 67 feet above the ground, and about 345 feet above the sea. It is navigable for ships of any burden to the distance of fifteen miles from its entrance, or seven miles above Sydney, up what is called the Paramatta River. Ships come close up to the wharves and stores of the town, their cargoes being hoisted from the ship's hold into the warehouses. Sydney is consequently the emporium of all the settlements in this part of Australia, and has a very extensive trade. Down to the discovery of the gold fields in 1851, wool was by far the most important product raised in the colony. The increase of cattle and sheep, but especially the latter, in Australia has in truth been altogether extraordinary. Previously to the arrival of the English settlers in New South Wales in 1788, neither horse nor cow, sheep nor hog, had ever set foot on the continent. The stock they brought with them was limited in the extreme, consisting only of 7 horses, 7 head of cattle, 29 sheep, 19 goats, and 74 pigs. And from this late and scanty stock, assisted by a few subsequent importations, have been derived all the vast numbers of sheep and other useful animals now to be found in the Australian continent. For a while the rate of increase was comparatively slow. But from 1810 down to 1851, when the revolution occasioned by the gold discovery affected every branch of industry, the multiplication of sheep and other stock, especially the former, has been rapid beyond all precedent. This is shown by the following account of the sheep's wool annually imported from Australia into the United Kingdom since 1840:

Years.	Pounds.	Years.	Pounds.
1840	9,721,423	1847	26,056,315
1841	12,390,090	1849	30,034,567
1842	12,050,071	1850	35,174,671
1843	17,435,780	1850	39,018,221
1844	17,589,712	1851	41,810,137
1845	24,150,687	1852	43,197,301
1846	21,865,270		

Down to 1851 the colony of New South Wales comprised the extensive province of Port Phillip, now Victoria. But the latter was then separated from the former, and formed into an independent state, with a governor and Legislature of its own.—*See* MELBOURNE.

At the close of December, 1851, the colony of New South Wales (exclusive of Victoria) had a population

of 197,168. It had also, at the same time, 152,057 acres under crop, 116,397 horses, 1,875,257 head of cattle, and 7,306,895 sheep. During the same year the value of the imports (mostly from England) amounted to £1,563,931, and that of the exports to £1,706,912. The latter comprised, among others, the following items, viz.:

Wool	15,368,493 lbs.	Value,	£328,302
Gold bullion	144,120 oz. 17 dwt.	"	468,389
Tallow	64,464 cwt.	"	114,168
Hides		"	96,695
Whale oil	601¼ tons.	"	25,377

with neat cattle, flour and bread, bones, soap, cedar, and other woods, etc.

Harbor Dues, etc.—The colonial Legislature has also, by an act passed in 1852, suppressed all charges on shipping for harbor dues, light-house dues, fees on entering and clearing, water police dues, etc. Sydney is therefore really a free port. *See* articles AUSTRALIA, MELBOURNE, and NEW SOUTH WALES.

Moneys, Weights, and Measures.—Accounts are kept in sterling money; but Spanish dollars are most abundant. They pass current at 5*s.* each. The weights and measures are the same as those of England.

Syra, the ancient Syros, one of the islands of the Greek Archipelago, whose salubrity and fertility have been celebrated by Homer (POPE'S *Odyssey*, book xv. v. 438, etc.), in the group called the Northern Cyclades, fifteen miles west from the greater Delos, its port, on the east side of the island, being in lat. 37° 26′ 30″ N., long. 24° 57′ E. It is from nine to ten miles in length, by about five in breadth. Though rugged, it is carefully cultivated, and produces garden stuffs, wine, olives, figs, cotton, etc., with a little barley. The population in 1830 was set down by Mr. Urquhart at 4500; but we have been assured that it is at present (1853) little, if at all, short of 27 000.

It is indebted for this extraordinary increase of population to the convenience and excellence of its port and its central situation, which have made it a considerable commercial entrepôt. Though small, its harbor is accessible to line-of-battle ships. The holding ground is good, and it has in its centre about ten fathoms water. Merchantmen of from 400 to 500 tons burden moor within about 100 yards of the wharves. Winds from the southeast round to east-northeast throw in a heavy swell; but the port is well protected from winds from all other points. A light-house, with a revolving light, has been erected on Gaidoro Island, about 1½ mile southeast from the port. Most part of the trade that formerly centred at Scio is now carried on here; and the island has not only received numerous immigrants from Scio, but also from many other parts of Greece. Great Britain and most European powers have consuls in Syra; and it is also the principal seat of the Protestant missionaries to the Levant. The town is on the north side of the harbor. The oldest portion occupies the summit of a conical-shaped hill, probably the site of the acropolis of the ancient city. —*See* TOURNEFORT, *Voyage du Levant*. But the new streets and houses, of which there are many, come down to the water's edge. It has an appearance of great bustle and animation. Its copious spring of pure fresh water has been eulogized by Clarke (*Travels*). In 1848 no fewer than 468 vessels were registered at Syra, being a greater amount of shipping than belonged to any Greek port.

Syria (with **Palestine**), a large division of Asiatic Turkey, mostly between lat. 31° and 37° N., and long. 34° 30′ and 40° E.; bounded north by the Amanus Mountains, east by the Euphrates and the Arabian desert, south by Arabia Petræa, and west by the Mediterranean Sea. Estimated area, 50,000 square miles. Population about 1,865,000, mostly Mohammedans, but comprising about 345,000 Greek Christians, 260,000 Maronites and Roman Catholics, 175,000 Jews, 48,000 Druses, and 17,000 Metualis and Yezidis. The west, or coast portion, is mountainous; the east chiefly an elevated plain. After the Dead Sea, the principal lakes are those of Tiberias, or Genesareth, and Hinlash, in the valley of the Jordan; some smaller ones exist near Damascus and Antioch. The surface being very uneven, the climate and products vary greatly within short distances. Along the coasts the heat is great, and the orange, banana, and date flourish, while the summits of the mountains are seen covered with snow. In the north, and on the elevated plain east of the mountains, the climate is colder, but at Aleppo frosts are seldom severe, and snow rarely lies on the ground for more than a day at a time. The corn is nearly ripe early in May; and from June to September summer heats prevail, unbroken by any rain, though tempered in the west by sea-breezes. It is stated that the country is capable of producing sufficient to maintain ten times its present population; yet such is the rude method of agriculture, the depressed condition and insecurity of the rural population, and the uncertainty of taxation and government regulations, that in bad years corn must frequently be imported from Egypt and elsewhere. Wheat, barley, maize, millet, lentils, and sesamum, are raised in the plains, principally in the Haouran, which has always been considered the granary of Syria. Cotton and the mulberry flourish on the coast, and silk is produced on the slopes of Lebanon. The cotton annually raised in the south is estimated to amount in value to £350,000; and about 1700 cantars of silks, 10,700 cantars of tobacco, from 8000 to 10,000 cantars of gall-nuts, and 800 cantars of madder roots are annually produced. Other chief products are sheeps' wool, olive-oil, sugar, indigo, scammony, and other gums, safflower, dates, timber, hides, and skins. Sheep and other live-stock form, as in antiquity, a chief part of the wealth of the inhabitants; and, all merchandise being conveyed on the backs of animals, it is estimated that the transit trade employs 80,000 beasts, and about 30,000 drivers. About 3500 okes of sponge fished on the coast are sent to the ports of the Mediterranean annually; other fisheries are comparatively unimportant, as is mining industry. Damascus has about 4000 looms engaged in the manufacture of silks, and the same manufacture is carried on to a considerable extent in Aleppo. Cotton, and some woolen fabrics, shawls, gold and silver thread stuffs, are also woven there and elsewhere, and the total produce of the looms of Aleppo is estimated at £250,000 in annual value. Glass, earthen-wares, leather, and soap, are made in the above and other towns; and in Palestine great numbers of religious ornaments are manufactured for sale. Commerce is greatly impeded by the want of roads, those that exist being mere mule or camel tracks; also by the deficiency of good harbors. But as Syria is on the high route from Bagdad, Mosul, and Erzeroum, to Mecca, caravans annually traverse it, bringing galls, indigo, Mocha coffee, skins, Cashmere shawls, and other Indian manufactures, also the products of Asia Minor, Mesopotamia, and Persia, which are exchanged here for European manufactures and cochineal.

T.

Tacamahac, a resin obtained from the *Fagara octandra*; and likewise, it is supposed, from the *Populus balsamifera*. It comes in large oblong masses wrapped in flag leaves. It is of a light brown color, very brittle, and easily melted when heated. When pure, it has an aromatic smell, between that of lavender and musk, and dissolves completely in alcohol, water having no action upon it.—THOMSON'S *Chemistry*.

Tack, a rope used to confine the foremost lower corners of the courses and stay-sails in a fixed position when the wind crosses the ship's course obliquely. The same name is also given to the rope employed to pull out the lower corner of a studding-sail or driver to the extremity of its boom. The mainsail and foresail of a ship are furnished with a tack on each side, which is formed of a thick rope tapering to the end, and having a knot wrought upon the largest end, by which it is firmly retained in the clew of the sail. By this means one tack is always fastened to windward, at the same time that the sheet extends the sail to the leeward.

To tack, to change the course from one board to another, or turn the ship about from the starboard to the larboard tack in a contrary wind. Thus, a ship being close-hauled on the larboard tack, and turning her prow suddenly to windward, receives the impression of the wind on her head sails, by which she falls off upon the line of the starboard tack. Tacking is also used in a more enlarged sense, to employ that maneuver in navigation by which a ship makes an oblique progression windward in a zigzag direction. This, however, is more usually called *beating* or *turning to windward*.

Tackle, a machine formed by the communication of a rope with an assemblage of blocks, and known in mechanics by the name of *pulley*. Tackles are used in a ship to raise, remove, or to secure weighty bodies, to support the masts, or to extend the sails and rigging. They are movable as communicating with a runner, or fixed as being hooked in an immovable situation; and they are more or less complicated in proportion to the effect which they are intended to produce. The application of the tackle to mechanical purposes is called *hoisting* or *bowsing*. Ground tackle implies the anchors, cables, etc.

Tafferel, the uppermost part of a ship's stern, being a curved piece of wood, and usually ornamented with some device in sculpture.

Taffeta, one of the earliest species of silken manufacture, more prized formerly than now, woven very smooth and glossy. It was worn by queens, and was first made in England by John Tyce, of Shoreditch, London, 41 Elizabeth, 1598.—STOHR'S *Chron.* Taffeta has been superseded by numerous descriptions of manufacture more esteemed by the female world.—HAYDN.

Taganrog, a city of European Russia, on the north coast of the Sea of Azof, near the mouth of the River Don, lat. 47° 12′ 48″ N., long. 38° 89′ E. Population, 18,000. It has a naval hospital, a lazaretto, etc.; and there are annual fairs in May, August, and November. Taganrog is a place of considerable commercial importance. It was intended by its illustrious founder, Peter the Great, to replace Azof, the ancient emporium of the Don, the port of which had become all but inaccessible; and its whole consequence is derived from this circumstance, or from its being the entrepôt of the commerce of the countries traversed by that great river. The largest portion by far of the trade is carried on with Constantinople, Smyrna, and other Turkish ports, but a good deal is also carried on with the Italian and other foreign ports; and there is an extensive coasting trade with Odessa and other Russian ports. In 1852 the exports to foreign countries comprised, among other articles, 1,102,047 chetwerts wheat, 112,510 poods tallow, 175,336 poods wool, 26,194 poods caviare, 846,880 chetwerts linseed, etc. Seeing that Taganrog was built to obviate the difficulties that had to be encountered by vessels entering the Don, through the shallowness of the water, it might have been supposed that care would be taken to place it in a position in which it should be, in as far as possible, free from this defect. This important consideration seems, however, to have been to a great degree overlooked. The Gulf of the Don is seldom navigable by vessels drawing more than from ten to eleven feet water, and even these can not approach within less than about 700 yards of the town. They are principally loaded by carts, drawn each by a single horse, the expenses being so very considerable that it costs from 120 to 150 copecks to ship a chetwert of wheat. Without, however, altering the position of the town, these defects might be obviated with but little difficulty, by constructing a wooden pier by which vessels in the roads might be sheltered, and from which they might be laden.

It is impossible to form a correct estimate of the future magnitude of the trade of the Sea of Azof. No doubt, however, it is very great, being the natural seat of the commerce of some of the most extensive and fertile countries of Eastern Europe.

Were the navigation of the Don improved, and facilities given to foreigners entering the sea, the exports might be largely increased, even with recent prices, which have been nearly the same as those of Odessa. The harvests in the south of Russia fluctuate very greatly. The imports into the Sea of Azof are but inconsiderable, principally consisting of Greek wines, oils, dry salteries, and such like articles.

Talc, a species of fossil nearly allied to mica. It is soft, smooth, greasy to the feel, and may be split into fine plates or leaves, which are flexible, but not elastic. It has a greenish, whitish, or silver-like lustre. The leaves are transparent, and are used in many parts of India and China, as they were used in ancient Rome (PLINY, *Hist. Nat.*, lib. xxvi.), in windows instead of glass. In Bengal a seer of talc costs about two rupees, and will sometimes yield a dozen panes 12 inches by 9, or 10 by 10, according to the form of the mass, transparent enough to allow ordinary subjects to be seen at twenty or thirty yards' distance. It should be chosen of a beautiful pearl color; but it has, in general, either a yellowish or faint blue tinge. Its pure translucent flakes are frequently used by the Indians for ornamenting the bawbles employed in their ceremonies. Talc is employed in the composition of *rouge végétal*. The Romans prepared with it a beautiful blue, by combining it with the coloring fluid of particular kinds of testaceous animals. The talc brought from the Tyrolese mountains is called in commerce Venetian talc. Several varieties are found in India and Ceylon.—THOMSON'S *Chemistry*; REES' *Cyclopedia*; MILBURN'S *Oriental Commerce*; AINSLIE'S *Mat. Indica*.

Talent signifies both a weight and a coin very common among the ancients, but very different among different nations. The common Attic talent of weight contains 60 Attic minæ, or 6000 Attic drachmæ; and weighed, according to Dr. Arbuthnot, 59 lbs. 11 oz. 17½ grs. English Troy weight. There was another Attic talent, by some said to consist of 80, by others of 100 minæ. The Egyptian talent was 80 minæ; the Antiochian also 80; the Ptolemaic of Cleopatra 80⅔ that of Alexandria, 96; and the insular talent, 120. In the valuation of money, the Grecian talent, according to Dr. Arbuthnot, was equal to 60 minæ; or, reckoning the mina at £3 4*s.* 7*d.*, equal to £193 15*s.* The Syrian talent, in this valuation, consisted of 15 Attic minæ, the Ptolemaic of 20, the Antiochian of 60, the

Eubœan of 60, the Babylonic of 70, the greater Attic of 80, the Tyrian of 80, the Eginæan of 100, the Rhodian of 100, and the Egyptian of 80 minæ. There is another talent much more ancient, which Dr. Arbuthnot calls the *Homeric talent* of gold, which seems to have weighed six Attic drachmæ, or three Doric, a Doric weighing very little more than a guinea. According to this talent some reckon the treasure of King David, particularly that mentioned 1 *Chron.* xx. 14, which, according to the common reckoning, would amount in gold talents to the value of £547,500,000, and the silver to above £342,000. As David reigned in Judea after the siege of Troy, it is not improbable but Homer and he might use the same numeral talent of gold. Among the Romans there were two kinds of talents, the *little* and the *great* talent. The little was the common talent; and whenever they say simply *talentum*, they are to be understood of this. The little talent was 60 minæ or Roman pounds, the mina or pound being estimated at 100 drachmæ or denarii. It was also estimated at twenty-four great sesterces, which amounted to £60. The great talent exceeded the less by one-third part. Budæus computes that the little talent of silver was worth £75 sterling, and the greater £99 6*s.* 8*d.* sterling. The greater of gold was worth £1125 sterling.

Talent, as a species of money among the Hebrews, was sometimes used for a gold coin, the same with the shekel of gold, called also *stater*, and weighing only four drachmæ. The Hebrews reckoned by these talents, as we do by pounds, etc. Thus a million of gold, or a million of talents of gold, among them was a million of shekels, or nummi; the nummus of gold being the same weight with the shekel; viz., 4 drachmæ. But the Hebrew talent weight of silver, which they called *cicar*, was equivalent to that of 3000 shekels, or 113 lbs. 10 oz. 1 dwt. 10$\frac{1}{2}$ grs. English Troy weight., according to Arbuthnot's computation.—E. B. *See* Coins.

Tallow (Fr. *Suif*; Ger. *Talg*; It. *Sevo*, *Sego*; Russ. *Salo*, *toplenoe*; Sp. *Sebo*), animal fat melted and separated from the fibrous matter mixed with it. Its quality depends partly on the animal from which it has been prepared, but more, perhaps, on the care taken in its purification. It is firm, brittle, and has a peculiar heavy odor. When pure, it is white, tasteless, and nearly insipid; but the tallow of commerce has usually a yellowish tinge, and is divided, according to the degree of its purity and consistence, into candle and soap tallow. Tallow is an article of great importance. It is manufactured into candles and soap, and is extensively used in the dressing of leather, and in various processes of the arts. The exports of tallow from Russia amount, at an average, to about 3,810,000 poods, or 137,160,000 lbs. a year.—Tegoborski, *Forces Productives de la Russie*, i. 233. Of this immense supply, the export of the largest portion is to England; the remainder being exported to Prussia, France, the Hanse Towns, Turkey, etc.

We borrow from the work of Mr. Borrisow, on the commerce of Petersburg, the following details with respect to the tallow trade of that city: Tallow is divided into different sorts; namely, white and yellow *candle tallow*, and common and Siberian *soap tallow*; although it is allowed that the same sort often differs in quality. Tallow is brought to Petersburg from the interior; and the best soap tallow from Siberia, by various rivers, to the Lake Ladoga, and thence by the canal of Schlusselburg to the Neva. Yellow candle tallow, when good, should be clean, dry, hard when broken, and of a fine yellow color throughout. The white candle tallow, when good, is white, brittle, hard, dry, and clean. The best white tallow is brought from Woronesch. As for soap tallow, the more greasy and yellow it is, the better the quality. That from Siberia is the purest, and commonly fetches a higher price than the other sorts. The exports of tallow from Petersburg in 1852 amounted to 2,062,101 poods. Formerly the oil and tallow warehouses were the same, and this occasioned great difficulties in shipping, because all vessels or lighters taking in tallow or oil were obliged to haul down to the *ambare*, and wait in rotation for their cargoes. The consequence was, that, when much business was doing, a vessel was often detained for several weeks at the *ambare* before she could get her cargo on board. Now the tallow and oil warehouses are separated, and every article has its own place. When a shipment of tallow is made, the agent is furnished by the selector (*bracker*) with a sample from each cask. Captains, in order to obtain more freight, usually load some casks of tallow upon deck; but it is more for the interest of the owner to avoid this, if possible, because the tallow loses, through the heat of the sun, considerably, both in weight and quality. One hundred and twenty poods of tallow, gross weight, make a Petersburg last, and 63 poods a ton. The value of the tallow exported from Russia is said by M. Tegoborski to amount, at an average, to about 3,871,000 roubles, or about $15,500,000.

Exports of domestic Tallow from the United States during the Year ending June 30, 1857.

Whither exported.	Pounds.	Value.
Danish West Indies	8,750	$1,068
Hamburg	26,587	3,320
Dutch West Indies	436	55

Sandwich Islands	86,965	6,542
Total	166,548	$12,567

Tally Trade, the name given to a system of dealing carried on in London and other large towns, by which shop-keepers furnish certain articles on credit to their customers, the latter agreeing to pay the stipulated price by certain weekly or monthly installments. In London there are about sixty or seventy tally-shops of note, and from 500 to 600 on a smaller scale. They are also spread over the country to a considerable extent, particularly in the manufacturing districts. The customers of the tally-shops are mostly women, consisting principally of the wives of laborers, mechanics, porters, etc., servant girls, and females of loose character. Few only of the more respectable classes have been infatuated enough to resort to them.

Tamarinds (Ger. *Tamarinden*; Fr. *Tamarins*; It. and Sp. *Tamarindo*; Arab. *Umblie*; Hind. *Tintiri*), the fruit of the *Tamarindus Indica*, a tree which grows in the East and West Indies, in Arabia, and Egypt. In the West Indies the pods or fruit, being gathered when ripe, and freed from the shelly fragments, are placed in layers in a cask, and boiling sirup poured over them, till the cask be filled; the sirup pervades every part quite down to the bottom; and when cool, the cask is headed for sale. The East India tamarinds are darker

colored and drier, and are said to be preserved without sugar. When good, tamarinds are free from any degree of mustiness; the seeds are hard, flat, and clean; the strings tough and entire; and a clean knife thrust into them does not receive any coating of copper. They should be preserved in closely-covered jars.—THOMSON'S *Dispensatory*. The tamarind-tree was very early introduced into England, where it sometimes is known to flower; from which circumstance it may be inferred that it would prosper in favorable localities in some of our Southern States, and probably mature its fruit. There is, perhaps, only one species of this genus; but the West Indian tamarind, believed to be only a variety, differs much from the East Indian, in the form of its fruit and the number of its seeds.

Tampico, or Santa Ana de Tamaulipas, a sea-port town of the Mexican confederation, department, and 215 miles north-northwest from Vera Cruz, on the south shore of the Lake of Ta...pico. Population, 7000. It is regularly laid out on a slope, and has some good dwellings in the old Spanish style, with military and naval hospitals, some public monuments, and well-supplied markets. It is better drained and less unhealthy than formerly. Principal exports are specie, hides, tallow, bones, and jerked beef.

IMPORTS INTO TAMPICO FROM THE UNITED STATES, WITH THE ESTIMATED DUTIES.

Years.	Amount of Cargoes.	Import Duties.
1851	$273,704	$265,278
1852	196,936	147,702
1853	843,564	632,673

The exports hence to the United States during the year 1837 amounted to $1,283,157, whereas the returns of the year 1855 only amount to the sum of $208,571. In 1834 the total amount of specie from this port was, by official returns, $9,165,178, of which over $2,000,000 went to the United States, the balance to Europe. A serious drawback to the commercial intercourse between this port and the United States is the want of direct steam conveyance. The geographical position of Tampico has many advantages over any other port in the republic, in consequence of its proximity to San Luis Potosi, where goods can be sent at 50 per cent. less in the charges of freight than from Vera Cruz, and San Luis being the key to all the principal places in the sections of the country whose commerce is supplied with foreign goods, and the spot where the goods meet from the states of Durango, Jalisco, Guanajuato, and Zacatecas, these being the principal mining states in the republic. There were twelve arrivals and departures of English packets, bringing to ...mpico 3431 quicksilver flasks, and taking thence cargoes of an aggregate value of $3,459,061; which, added to the aggregate value of other outward cargoes, makes a total of $3,994,772.

RETURNS OF AMERICAN AND FOREIGN TRADE AT THE PORT OF TAMPICO DURING THE YEAR ENDING DECEMBER 31, 1854.

Nations.	Tons.	Value of Imports.	Tons.	Value of Exports.
American vessels	2.75	$260,367	3011	$208,471
Mexican "	2764	216,700	2650	61,890

French "	2100	530,382	2206	....
English "	895	493,140	895	238,000
Danish "	280	111,335	280	900
Total	9259	$1,678,026	9407	$535,711

Tanning. The process of tanning leather with the bark of trees was early practiced by various nations. The use of tan was introduced into these countries from Holland by William III., for raising orange-trees. It was discontinued until about 1710, when ananas were first brought into England. Since then tan has been in general use in gardening. Great improvements were made in tanning in 1795, *et seq.*

Tapestry, an art of weaving borrowed from the Saracens; and hence its original workers in France were called Sarazinois. The invention of tapestry hangings belongs (the date is not mentioned) to the Netherlands.—GUICCIARDINI. Manufactured in France under Henry IV., by artists invited from Flanders, 1606. The art was brought into England by William Sheldon, and the first manufactory of it was established at Mortlake by Sir Francis Crane, 17 James I., 1619.—SALMON. Under Louis XIV. the art of tapestry was much improved in France.—*See* GOBELIN TAPESTRY. Very early instances of making tapestry are mentioned by the ancient poets, and also in Scripture; so that the Saracen manufacture is a revival of the art. For the tapestry wrought by Matilda of England, *see* BAYEAUX, *Tapestry*, p. 74.

Tapioca, a species of starch or white coarse powder derived from the roots of the bitter cassava (*Jatropa manihot*), an American plant raised all over South America, but principally in Brazil, where it is called *mandioc* or *manioc*. The roots of the plant, being peeled, are subjected to pressure in a kind of bag made of rushes; the juice which is forced out by this process being a deadly poison, and employed as such by the Indians to poison their arrows. But the residuum, or farinaceous matter remaining after the expulsion of the juice, is perfectly wholesome, and makes excellent bread. Tapioca, as stated above, is prepared from this residuum; and being nutritious and easy of digestion, is extensively used in the making of puddings. When dressed, it is not easily distinguished from sago.

Tar (Fr. *Goudron*; Ger. *Theer*; It. *Catrame*; Pol. *Smola gesta*; Russ. *Degot, Smola shitkaja*; Swed. *Tjara*), a thick, black, unctuous substance, chiefly obtained from the pine and other turpentine trees, by burning them in a close, smothering heat.

EXPORTS OF TAR FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Tar is an article of great commercial importance. The process followed in making it has been described as follows by Dr. Clarke: "The situation most favorable to the process is in a forest near to a marsh or bog; because the roots of the fir, from which tar is principally extracted, are always most productive in such places. A conical cavity is then made in the ground (generally in the side of a bank or sloping hill), and the roots of the fir, together with logs and billets of the same, being neatly trussed in a stack of the same conical shape, are let into this cavity. The whole is then covered with turf, to prevent the volatile parts from being dissipated, which by means of a heavy wooden mallet, and a wooden stamper, worked separately by two men, is beaten down and rendered as firm as possible above the wood. The stack of billets is then kindled, and a slow combustion of the fir takes place, without flame, as in making charcoal. During this combustion the tar exudes; and a cast-iron pan being at the bottom of the funnel, with a spout which projects through the side of the bank, barrels are placed beneath this spout to collect the fluid as it comes away. As fast as the barrels are filled they are bunged and ready for immediate exportation. From this description it will be evident that the mode of obtaining tar is by a kind of distillation *per descensum*; the turpentine, melted by fire, mixing with the sap and juices of the fir, while the wood itself, becoming charred, is converted into charcoal."

Tare, an abatement or deduction made from the weight of a parcel of goods, on account of the weight of the chest, cask, bag, etc., in which they are contained. Tare is distinguished into *real tare*, *customary tare*, and *average tare*. The first is the actual weight of the package; the second its supposed weight according to the practice among merchants; and the third is the medium tare, deduced from weighing a few packages, and taking it as the standard for the whole. In some commercial cities tares are generally fixed by custom. The prevailing practice, as to all goods that can be unpacked without injury, both at the custom-house and among merchants, is to ascertain the real tare. Sometimes, however, the buyer and seller make a particular agreement about it.

Tare, Vetch, or **Fitch**, a plant (*Vicia sativa*, Linn.) that is cultivated principally for its stem and leaves, which are used in the feeding of sheep, horses, and cattle; but partly, also, for its seed. Horses thrive better upon tares than upon clover and rye grass; and cows that are fed upon them give most milk. The seed is principally used in the feeding of pigeons and other poultry.

Tariff, or **Tarif**. First, a list of certain goods, merchandise, etc.; then a list of duties on imports or exports of such articles. This word, like many others used in commerce, is derived from the Italian, in which it is *tariffa*; this again, like numerous other expressions relating to commerce and navigation, comes from the East. In Persian it is *tarif*; in Arabian the verb *arf* signifies *to know*, which in the second form becomes *tarif*, signifying *to make known*. The substantive derived from the verb therefore signifies *notification*. The principles of a tariff depend upon the commercial policy of the state by which it is framed; and the details are constantly fluctuating with the change of interests, and with the wants of the government or community, or in pursuance of commercial treaties with other nations. The British tariff underwent seven important changes between the years 1772 and 1842; viz., in 1787, in 1809, in 1819, in 1825, in 1833, and in 1842. Finally, on 26th June, 1846, the royal assent was given to Sir Robert Peel's noted tariff—a measure which canceled the duties on several hundred articles, and pressed upon the country the adoption of free trade.

The able report of L. D. Campbell, of the House of Representatives, 1856, to the Committee of Ways and Means, is a just and comprehensive exposition of the protective (not prohibitive) system; and as such, and as being the report upon which our present tariff was mainly constructed, we need not apologise for giving extended extracts. The moderately protective tariff is essential in the early commercial and manufacturing stages of a country. And the fact that free trade may at some future time be advantageous to us does not prove its present necessity. It will be seen that, though generally assenting to the asserted fact that the purpose of revenue alone can justify the imposition of duties, yet the proofs and statistics given prove too much, and prove to the unprejudiced reader that duties are not alone necessary for revenue, but *may* be necessary for protection.

Principle and Policy of the Proposition.—The propriety of the proposed reduction of the tariff of duties upon imports is made by the President's annual message to rest, first, upon the *principle* that "the purposes of revenue alone can justify their imposition;" and, second, upon the policy of "reducing the tariff of duties upon imports, as the means of reducing the revenue to the amount annually needed for the prudent and economical administration of public affairs."

The recommendation of the message, thus analyzed, affords a principle which the President contents himself with saying "is so generally conceded, that, in readjusting the impost tables and schedules, which unquestionably require essential modifications, a departure from the principles of the present tariff is not anticipated," and a *policy* which he does not in any manner undertake to verify or illustrate. It stands in the message as a position assumed without proof, or as too plain to require demonstration.

Revenue limited by Expenditures.—Your committee perceive only one sense in which the President's doctrine concerning the purpose for which import duties may be imposed can be regarded as generally conceded. Imposts employed as a measure of taxation must be conformed to the requirements of the public revenue, or they miss the controlling object of their imposition.

Taxes of every kind must be levied at once up to the necessities, and within the limits of government expenses; in other words, the gross amount of revenue must be regulated by the demand of the government for its current expenses; and, where foreign imports are selected by the policy of the nation to bear the chief burden of its support, the tax imposed must be determined in amount by the requirements of the national treasury.

Thus far it is conceded that the purpose of revenue alone can justify their imposition; and thus far the doctrine of the message is in accordance with the sentiments of the American people. But tariffs have other legitimate purposes, and are capable of other and important uses, while kept in strict conformity to the requirements of the national treasury.

Impost Systems of all Nations protective of their productive Industry.—Our own Policy persistently governed by this Intention.—The protection of the national industry, by means of duties laid upon foreign imports, is one of the purposes which characterize the impost systems of all the governments of the earth, whose rank entitles them to consideration as authorities with us. This policy, since its adoption by the first-class nations, has undergone changes corresponding to changes of condition, both in Europe and America, but the principle has never been abandoned. The Continent of Europe holds it as firmly as ever, and Great Britain, by working it to its utmost capacity of beneficial service, has thoroughly justified the theory. Her experience is its most perfect demonstration. In the United States the doctrine has its disciples and supporters as numerous and influential as principles, rightly understood, ever secured among an intelligent and patriotic people. In the forty years of controversy to which it has been subjected in this country, the opposing theory has never obtained a victory or a concession which can

in any way entitle its advocates to claim possession of the field. Fifteen general acts of legislation have made as many changes in the details of our tariff laws, but none of them has yielded the principle of protection, direct or indirect, to our national industry.

Duties less than protective, Fluctuations of the Revenue, and Vicissitudes in the Business of the Country.—The compromise of 1833, of all the general acts of Congress imposing duties upon imports, alone seems to yield prospectively to the doctrine of a tariff for revenue without effectual incidental protection. It is the only instance of a horizontal rate of duties carried below the point of adequate encouragement of our home industry. But even under this act, the level 20 per cent. which its provisions contemplated was not to take effect until after the 30th of June, 1842. Till that date the successive reductions of all excess in the rates over 20 per cent. continued to wear the discriminating features of the protective tariff, which it modified, although the rates ran below the point of protection; and its large free list decidedly expressed the same intention. Nine years' experience of the operation of this act abundantly manifested its unfitness for any of the purposes which a policy of imposts should answer. The revenue derived from it declined in four years from twenty-nine millions to eleven; rose again in two years to twenty-three; sunk the next year to thirteen and a half; and stood three years afterward at eighteen millions. The vicissitudes in the business of the country, and the disasters which its monetary interests encountered in this period, are well remembered. They are indicated sufficiently by the following facts. The price of flour in 1837 was $10 25 per barrel; in 1842 it had fallen to $6. In 1836 twenty-five millions of dollars' worth of public lands were sold; in 1842 less than two millions of dollars' worth. In 1836 cotton was at 16·8 cents per lb., in 1842 at 8·1 cents per lb. The export had in six years risen one hundred and sixty millions of pounds, and the total value had fallen twenty-three millions of dollars.

The tariff of 1842 was a convulsive reaction of the national sentiment, awakened by the sufferings of the people under the operation of the system of the Compromise Act.

The general bankruptcy of the people which had resulted was reflected by a corresponding bankruptcy of the national treasury. In 1836 a surplus fund of twenty-eight millions had been disposed of by ordering that amount to be deposited with the States; but sixteen months afterward the fourth installment of that deposit was arrested by the necessities of the treasury; and in six years from the date of the act required to relieve the plethora, it was fifty-four millions in debt!

The single instance of a tariff that looked to revenue only, and had the opportunity to practically demonstrate its working qualities, thus proved itself to be the only one ever put upon its trial wholly incapable of answering that special intention, and at the same time had proved more mischievous to every other object which the system of import duties effects, than any other that has ever been attempted.

Established Principles of our Revenue System.—Your committee, feeling well satisfied that the policy of the nation in respect to all the points involved in legislation upon the subject of import duties is sufficiently manifest, think it well to state its principal doctrines for the service which such a statement will render to the purposes and objects of this report:

I. The revenue of the government is to be raised from the sales of public lands, duties upon imports, and from miscellaneous sources, without resorting to internal taxation, direct or indirect.

II. The revenue to be derived from import duties, amounting in the average, since the foundation of the government, to six-sevenths of the resources relied upon, shall be levied under direction of the following principles: 1st. No more money shall be collected than is necessary for the wants of the government, economically administered. 2d. The duties shall be imposed so as to operate as equally as possible throughout the Union, discriminating neither for nor against any class, or section, or interest.

III. Conforming to the objects and limitations of these rules, certain kinds of imports shall be subject to varied rates of duty, and certain others shall be exempt from duty, in such manner as shall best foster and promote home production and the general welfare of the nation; taking care to distribute the protection so afforded over every interest of the people as equally as possible.

Revenue accruing under High and Low Tariffs, respectively, in the last thirty-two Years.—Let us see how either of these points, thus necessary to the validity of the calculation, is sustained or contradicted by the history of our foreign commerce in the last thirty-two years:

Years.	Millions of Dollars.	Sales of Land in Thousands of Dollars.	Average Sales per Annum.	Millions of Dollars Customs.	Average.	Millions of Dollars difference.

Productiveness of the higher and lower Tariffs of thirty-five Years. Steadiness of the former: Unsteadiness of the latter.—The income from customs, under the same tariff, rose from thirteen millions in 1821, to seventeen and a half millions in 1822. Under the tariff of 1824, from 1825 to 1828, it rose from twenty to twenty-three and a quarter millions; under that of 1828, from 1829 to 1832, it rose gradually from twenty-two and a half to twenty-eight and a half millions. Under the Compromise Act of 1833, which reduced the duties under the act of 1832, by biennially deducting one-tenth of the excess over 20 per cent., from and after the 31st of December, 1833, until the 31st of December, 1841, when one half of the remaining excess was struck off, and on the 30th of June, 1842, the other half thereof, the revenue from the customs rose in the first three years of its operation from sixteen to twenty-three and a half millions; in the next year, 1837, sunk to eleven millions—falling twelve and a half millions in one year—and rose again in 1839 to twenty-three millions, another difference of twelve millions in two years. In 1840 it ran down nine and a half millions, and in two years more rose four and a half millions.

The first year of the operation of the tariff of 1842, the customs amounted to no more than sixteen millions; the three following years it stood very steadily at twenty-six, twenty-seven and a half, and twenty-six and a half millions, respectively. In the years 1846–'47, during seven months of which the present tariff was in operation, the customs fell two and a half millions; in the following year of famine in Europe they rose eight millions; in the year 1848–'49 they declined three and a half millions, and in the succeeding year increased eleven and a quarter millions. In the year 1850–'51 they rose again nine and a half millions above the preceding year; in 1851–'52 they declined one and three-quarter millions; in 1852–'53 they rose eleven and three-quarter millions; in 1853–'54 they again increased five millions; and in 1854–'55 fell eleven millions.

Fluctuations of the Customs, and Tendency to Excess under the same low-duty Tariff.—In this summary it will be perceived that within the last nine years the revenue from customs has five times varied from the amounts yielded in the years immediately preceding these several changes, from eight to eleven millions of dollars. During these nine years the present tariff was in operation, and an unvarying rate of duties was charged upon the imports. Its changes of productiveness to the revenue have been changes of increase, indeed, but not in any balancing proportion to the naturally increasing expenditure of a growing population; for we find by statement No. 23, of the Secretary's report, that the consumption of foreign imports, *per capita*, rose in the first four years of the period from $6 60 to $10; and the surplus in the treasury after all ordinary expenditures, and the payment of over forty millions of the public debt besides, is conclusive of this point.

Your committee have not in these statements considered the causes of the great disparity of the revenues yielded to the treasury by the different rates of duty levied upon foreign imports. They have been looking simply to the question how far, and to what effect, impost percentages of themselves affect the revenue. For the proposition presented for their consideration by the President and Secretary embraces no more, either of facts or principles, than the naked assumption that the reduction of the percentage of itself must work a reduction of the revenue.

"*Low Duties yield the larger Revenue.*" *The Doctrine and Experience of the Past.*—That this doctrine is not in accordance with the facts of a large and varied experience, covering and embracing every variety of conditions which can affect the question, is abundantly manifested by the statistics presented. Indeed the directly opposite doctrine has been held by the advocates of low duties in all controversies which the matter has hitherto undergone. In 1845, pending the discussion which substituted the present reduced tariff for the higher one of 1842, it was argued by the Secretary of the Treasury, in his report of that year, that the larger revenue is produced by the lower rates of duty. He says, "The revenue from *ad valorem* duties last year exceeded that realized from specific duties, although the average of the *ad valorem* duties was only 23·57 per cent., and the average of the specific duties 41·30, presenting another strong proof that lower duties increase the revenue." And again, he says, "While it is impossible to adopt any horizontal scale of duties, or even any arbitrary maximum, experience proves that, as a general rule, 20 per cent. *ad valorem* will yield the largest revenue."

This principle, which is a sound one, does not apply to either of the extremes of impost rates, for the one may be carried up to the point which is prohibitory, or near to it, and the other down to that which would be as nearly nugatory, and so both extremes may be made to operate alike upon the treasury; but it is true within a comparatively moderate range of difference—that is, within any such difference of percentage as any advocate of reduction would now undertake to recommend.

The facts which our financial history offers in support of this doctrine are, in general, as conclusive as these following, which your committee select from a multitude for its proof.

Under the tariff of 1842 the average duties upon protected articles was something above 40 per cent.; the average monthly receipts from customs under that act amounted to $1,991,267. Under the tariff of 1846, with its average duties below 30 per cent., the monthly receipts during the first two years of its operation reached the sum of $2,575,207.

Mr. Walker, in his report, December 11, 1848, page 3, says: "As the high duties under the act of 1842 were rapidly substituting the domestic articles, and excluding the foreign rival, the revenue must have declined. From this disastrous condition we have been saved by the tariff of 1846, yielding from reduced taxes an average excess, thus far, of more than seven millions of dollars over the average receipts from the tariff of 1842."

Twice under the operation of the Compromise Act, once after the second deduction was made upon the rates of the act of 1832, and once after the third deduction, the revenue from customs rose to the annual average of the high tariff of 1828. And in the year 1842, when its lowest rates were nearly touched, and the level 20 per cent. was nearly its maximum, the customs stood higher than in five of the previous years of its operation, and above the average of the eight preceding years.

The average annual amount of the customs yielded by the tariff of 1824 was twenty-one and a half millions; of the tariff of 1828, was twenty-four and a fourth millions. In a period of twenty-two years, rising five millions, or 23 per cent. The average of the first four years of the tariff of 1846 was thirty-three and a fourth millions—25 per cent. in four years; the average of its second four years was fifty-four and three-fourths millions; rising in eight years twenty-seven and a half millions per annum, or 133 per cent.

The average annual consumption of foreign imports *per capita* under the tariff of 1824 amounted to $5 26; under the tariff of 1828, $5 21; under that of 1842, to $5 20; while under the lower tariff of 1846, during the four years of its operation previous to the influx of the California gold, the consumption rose to $6 50 *per capita* of the population, and under the very low average duties of the whole period of the compromise the consumption stood at $7 28.

These facts show how much more productive of revenue the lower tariffs rates are than those which,

though considered higher, are yet far short of prohibiting importation, or seriously interfering with the prosperity of the carrying trade.

Causes of larger Revenue from lower Duties. — As a means of lessening the revenue derived from customs, or of lessening its proportion to the public expenditure, it is thus made apparent, by the facts of a conclusive experience, that a mere reduction of the rates of duty can not be relied upon; but, on the contrary, that the policy has always the directly opposite effect, and this for many obvious reasons.

A reduction of duties induces increased importations of foreign commodities, disturbing our money market by diminishing the available capital, and enhancing its rate of interest to our own manufacturers. The importer obtains command of the market, and to the extent to which the home competition is crippled in the production of such articles, it opens a vacancy to be supplied by importation, and adds just so much more to the customs as such supply from abroad will yield; and, therefore, so long as the country has the means of purchasing such increased quantity of foreign goods, so replacing the home product, the revenues will continue to augment, instead of diminishing, under the lower rates.

Again, an increased demand for our breadstuffs and provisions in Europe, occasioned by failure of crops there, will have the effect, under a low tariff, of inducing large importations, and, consequently, a large enhancement of the customs. In the famine year of 1847 the customs rose eight millions above the receipts of the year immediately preceding; and every deficiency of crops abroad, to the extent to which it occurs, must have a proportionate effect in the same direction.

Again, a large increase in our agricultural and manufacturing products, by affording a surplus for exportation at any price which will pay transportation, will have a similar effect.

Again, foreign wars, by increasing the demand upon us for provisions, induces a corresponding increase of our importations, and a corresponding augmentation of the revenues resulting from it.

Again, abundant products of the precious metals, by affording the means of large purchases, operate in the same way.

And again, the system of railroad and other enterprises now in active operation in this country, which demand large capital on long credits, bring loans in immense amounts, in the shape of dutiable merchandise, to swell the customs.

All the causes above mentioned, except diminished rates of duty, and great failure of crops abroad, have been in operation upon the customs since the fiscal year 1849–'50, and we have their combined effect in raising the revenue derived from this source from less than forty to over sixty-four millions of dollars per annum in the space of four years.

In the last year they fell off eleven millions, owing to the absence of some of the causes which we have noticed, but their product still stood at thirteen millions above that of the year 1849–'50, and nearly six millions above that of 1851–'52.

Alternations of Excess and Deficiency in the Revenue under Duties lower than protective.—From these facts, and the laws of national finance which they illustrate, it is obvious that the ratio of percentage imposed upon imports, acting within a moderate range of differences, is the least influential, and the most likely to deceive expectation, of all the causes which usually affect the revenues arising from them. But low duties not only disappoint the intention for which they are recommended, in the manner and for the reasons given, but, by their own inherent vices, they are not only liable, but certain, in despite of all modifying influences, ordinary and extraordinary, to work mischievously in the opposite direction—in spasmodic alternations from excess to deficiency.

The first reduction of the duties of the act of 1832, provided for by the compromise of 1833, took effect on the 1st January, 1834. At the end of that year the public debt was paid off, and there was a balance in the treasury of a little less than nine millions of dollars. In 1835 the revenue from customs and the sale of public lands rose thirteen millions and a half above the receipts from the same sources in the preceding year; and in the year 1836 they rose fourteen and a half millions more; so that at the end of the year 1836 there was a balance in the treasury of forty-six and a half millions. To dispose of this enormous surplus of public moneys, the act of 23d June, 1836, was passed, directing the deposit of twenty-eight millions with the States. But such tendency to excess in the system of national finances, like the febrile paroxysms of the human constitution, speedily passes into the stage of exhaustion. In 1837 the revenue from public lands and customs fell to eighteen millions, from forty-eight millions the year before; and on the 12th October of that year, the issue of ten millions of treasury notes was authorized to supply its deficiency for the services of the government. In 1839 the revenues rose to thirty millions—twelve millions in two years; and in two years more sunk to fifteen and three-fourth millions—another fall of nearly 100 per cent. in two years.

Thus, in the first three years of the Compromise Act we have the whole difference between twenty-one and forty-eight millions of revenue per annum resulting to the treasury, and in the next five years the still greater difference of a decline from forty-eight to fifteen and three-quarter millions. Under the operation of the second reduction, while the duties remained the same, the customs fell off from twenty-three and a half to eleven millions; and under the operation of the third reduction, they rose again to twenty-three millions—fluctuations in the revenue which baffled all calculation and destroyed all reliance.

Steadiness of the Revenue, and Adjustment to Expenditure, under protective Tariffs.—Under the tariff of 1824 the revenue varied no more than from twenty-two to twenty-five millions in four years; and under that of 1828 from twenty-five to thirty-two millions by regular increase in four years. Under that of 1842 the customs rose from the depressed point of eighteen to the steady and adequate one of twenty-seven and a half millions in four years, and the receipts from the public lands raised only from one and a third millions to two millions.

The public expenditures during the three periods of these comparatively high tariffs were very regularly covered by the national income—the first yielding five millions, the second four millions, and the last thirteen millions, or from one to three millions per annum more than the current ordinary expenses of their respective periods of operation; amounting annually to no more than such balance in the treasury as it is prudent to hold for its incidental uses.

Plethora of the Treasury under the Compromise Act, and under the Tariff of 1846.—Under the low tariff of 1833 we have first an enormous surplus in the treasury, then a large deficiency and debt. Under that of 1846 we have arrived at such a surplus of public moneys as again calls for relief; we have a balance in the treasury now of nineteen millions, and we are threatened with its augmentation to the amount of thirty millions in a year to come.

It is not intended by this contrast of the steadiness of the revenue under the highest tariffs and their happier adaptation to the wants of the treasury, against the unsteadiness of the income and its maladjustment to expenditure under the lower tariffs, to espouse the rates of duty of the particular systems cited of the one class, or to condemn the systems of the other by so sweeping a generalization; but they are arrayed here now simply to exhibit their respective workings, as

the facts and figures of their history present them to us, and that they may serve as data for the inquiry before us.

Your committee are as well aware, and feel as forcibly as any objector can, that where a number of causes are in existence, and co-operating in the result, especially when several of them are inter-dependent, and some of them independent of the others, the difficulty of determining their respective agencies is great in proportion to the complexity and diversity of the forces at work; but such difficulty, in a matter of the vast importance of that under investigation, only increases the necessity for endeavoring a solution.

The fluctuations of the national revenue during the operation of the low tariffs, and its steadiness under the higher ones, occurring in a constant connection in the last thirty-five years of our financial experience, seem to admit of a clear and instructive explanation.

The following propositions, which embrace the facts involved correctly and sufficiently to cover all the operative causes, immediate and collateral, very fully satisfy the inquiry.

A tariff of duties ranging generally below the point of adequate protection to our home production, induces large importations by the effect of diminished prices, to the extent to which the purchaser's means are relatively increased, and to the further extent of supplying the vacancy occasioned by withdrawing from the market the amount of commodities of home production which are so excluded.

Effect of low Tariffs upon the Income from the public Lands.—In 1834, the first year of the reduction under the Compromise Act, the imports for consumption rose three and a half millions, and the revenue fell off twelve millions.

In the year 1835 the imports rose again thirty-five millions, and the revenue from them was less by ten millions than in the year 1833; but nearly fifteen millions of dollars flowed into the treasury that year from the sales of the public lands, bringing the total revenue up to the total of 1833, and more than a million above it.

In the following year, 1836, the imports for consumption took another rise of thirty-seven millions; the customs reached within five and a half millions of the highest point they had ever attained under the preceding tariffs. The public lands rose to the enormous amount of twenty-five millions; and the total revenue of the year stood at seventeen millions above that of 1833—the highest mark of the high tariff years.

Under the lowest of our Tariffs the greatest Excess and the greatest Deficiency of Revenue both reached.—For nine years before 1834, the public lands had never in any one year yielded quite four millions, and the average was two, or nineteen millions in nine years; but in three years, 1834, '35, and '36, their product to the treasury was over forty-four millions. The customs for these three years, under the compromise, had fallen off from the sum of eighty-one and a half millions afforded by the three previous years of the higher tariff, to fifty-nine millions—a reduction of twenty-two and a half millions; but the revenue of the treasury, by the addition of thirty-six millions from the public lands, above their average previous yield, amounted to fourteen millions more for these three years of the compromise than for the three preceding years; and the proceeds from the sales of lands continued for three years longer to yield ten millions more than their product under any higher tariff which we had before or since. At the close of the year 1839 these movements had exhausted themselves. The customs for the three following years ran down to forty-six millions, twenty-eight millions below the ordinary expenditures of the period; the lands fell to two millions per annum, and the principal of the public debt contracted in the five preceding years stood at ten millions.

The operation of a tariff of duties below the point of protection, with the long run of nine years for its developments, is here fully presented. All the causes which could affect the results had room and time for their natural action, and their combined results are openly exhibited.

Its first effect was to nearly double our foreign importations in three years. This had the effect, by reduction of prices and glut of the market, of crushing the rival manufacturing industry at home; mills and work-shops were crippled and closed; the capital and labor driven from them sought employment in agriculture; the sales of public lands amounted to more than seven-fold the average quantity of any other period of ten years before or ten years afterward; and the term wound up with a general bankruptcy of the national treasury, and of the people, bringing with it a complete political revolution, and compelling a total change in the financial policy of the government.

The fluctuations of revenue under it are strikingly marked by the facts that the income from all sources never afterward rose to within eight millions of that of 1836, until the year 1850-'51, and had not fallen so low as in the year 1841 since the year 1821; it, in fact, touched a point below the receipts into the treasury of the year 1808. Its fluctuations in a period of five years touched both extremes of the revenue of the nation, running through thirty-four years of change; that is, the revenue had not been so low for twenty-five years before the year 1841, nor so high for fourteen years after 1836.

Greatest Fluctuation in Prices under the lowest Tariffs.—The business of the country felt these vicissitudes in our foreign commerce, and answered to them like their echo. Within a period of six years, while this tariff was developing its extremes of change, from 1836 to 1842, the highest and lowest prices of eighteen years were touched. Cotton, flour, provisions, tobacco, commodities of all kinds, labor and real estate, went up in price almost in the exact ratio that importations increased—that is, to nearly double the amount of 1833, in 1836; and in 1842, the imports falling to one half in amount, so the property, labor, and products of the country stood at half the market value of six years before. Not an interest of the country on which its national or individual welfare depended, but had in that brief period undergone convulsions unparalleled since similar causes had resulted in the great business catastrophe of 1820-'21.

Such is the history of the policy which abandoned the revenues of the government, and the industrial interests of the country, to the operation of causes not within its control.

Undue Expansion of Bank Circulation inseparable from excessive Imports of foreign Merchandise.—It has been customary with the advocates of low tariff duties to charge the inflation of prices, the rage of speculation, and the resulting revulsions in the business prosperity of the country, to excessive issues of bank paper.

The fact that such overissues always concur with inordinate rise of prices is remarkable indeed, and offers a plausible explanation of the mischief; but the other fact, of the invariable concurrence of greatly enhanced prices and excessive bank issues with the reign of low tariffs, connect these phenomena in our financial history in a category of relations which very clearly shows that they are in their nature inseparable. If this be so, the government, which has the direct control of one of these agencies in the mischief, has an indirect but absolute control over the others, and should exert it.

Fixed Ratio of Bank Issues to foreign Imports.—In 1830 the bank circulation was estimated by Mr. Gallatin at sixty-one millions; in April, 1834, the Secretary of the Treasury, Mr. Taney, estimated the circulation at eighty millions. In the four years, 1830, 1831, 1832, and 1833, which immediately preceded the first reduction under the Compromise Act, the imports con-

sumed amounted to two hundred and ninety-one millions. At the end of the next five years, 1837, the bank circulation had swollen to one hundred and forty-nine millions, and the imports for consumption for 1834, 1835, 1836, and 1837, to four hundred and eighty-one millions. Thus the increase of the imports amounted to 75 per cent. for the period of four years, and the increase of the bank circulation to 80 per cent.; and if we add the increased purchase of public lands of the latter term over the former, we have the proportion of the circulation to the expansion of business speculations induced by the reduced tariff very exactly balanced.

In May, 1837, the banks, with one consent all over the Union, suspended specie payments, and did not permanently or effectually resume till the spring of 1842; then their circulation had fallen to eighty-three millions; nor did it rise higher than eighty-nine millions again during the operation of the tariff of 1842.

Since the year 1846, the increase and decrease of bank circulation hold so exact a ratio to the several instances and rates of increase and diminution of imports for consumption for each year of the whole period, as involves a direct and unquestionable connection between them.

The tabular statement appended to this report exhibits the constancy of this connection for every single year of our financial history since 1833, and for periods of years before and since, in a ratio so nearly mathematical that there seems no doubt of the law which rules the subject, as there is none of the facts which serve to demonstrate it.

It will be seen, by reference to the tabular statements of this report, how little power other causes, which were undoubtedly active in modifying the results, had to disturb the working of that one which is here assumed to be the principal. The expansions and contractions of bank credits and issues are certainly influenced by many other causes, but the fact that they have occurred during the last forty years, year by year, in an invariable relation to the fluctuations in the amount of our foreign imports, goes far to establish the idea that the variations in our imports rule the fluctuations in our paper currency; and this law is, moreover, so energetic that it even overrules the effects naturally expected from the large supply of gold furnished to the currency from the California mines. For it is as true as it is surprising that since 1850, as before, every year of increased import has been marked by an equivalent increase of bank circulation, and every year of diminished imports has been marked by a diminished bank circulation, corresponding in amount as nearly as it is possible to conceive a primary and ruling cause can operate while minor and subordinate ones are also in play.

Low Tariffs responsible for excessive Bank Issues.—That low tariff duties are responsible for the excess of foreign importation—that these augmented imports induce excessive bank issues, and excessive bank issues swell prices inordinately, in the series of dependency which is here alleged—is rendered unquestionable, by the fact that these expansions of imports, paper circulation, and prices, never have occurred when our tariffs were high enough to foster, but always when they were so low as to discourage, home production, and to substitute the foreign commodities for domestic products in our market.

Summary of the Reasons which forbid the Abandonment of protective Duties.—Your committee derive from this investigation of the effects of our varied tariff systems upon the revenue the following conclusions:

1. The immediate effect of duties below the rates which protect our own industry from the rivalry of foreign commodities of the same kind, is a proportionate enhancement of such imports, and a corresponding increase of the revenue from customs, which either approach, equal, or exceed the revenue from customs of the higher tariffs; but in all instances is certain to disappoint any expectation of a reduction of the customs in proportion to the abatement of the rates.

2. The increase of imports consequent upon a reduction of duties below the point of adequate protection drives manufacturing capital and labor into agriculture and trade, and by this means vastly increases the revenues from the sale of the public lands and from foreign commerce, and thus makes up all deficiency in the customs, and greatly overpasses it, and so tends to a plethora in the treasury, instead of limiting its income and restraining its overflow.

3. The indirect effects of the same policy is to exhaust the sources of national and individual prosperity, and by its reaction to bankrupt the treasury and prostrate the enterprise of the country, leaving debt, public and private, to punish the extravagance which it induced and indulged.

Your committee, therefore, for reasons cogent as these, and many others which depend upon these, but are irrelevant to this issue of mere national finance, would earnestly discourage any measure which, either in principle or in details, aims at relieving the treasury of its present and prospective surplus by a reduction of the present rates of impost duties below the point which any branch of our home industry requires for its security and prosperity. To guard against any possible misconstruction, it must be observed that by the frequent allusions of this report to excessive importations of foreign goods, and the influences drawn from such excess of importation, the apparent "balance of trade" against the United States, which the statements of the Treasury Department exhibit for any single year, or for any series or groups of years, is not taken, or intended to any effect or purpose for which the difference in official value between our imports and exports has been used by either party to the controversy.

The total value or valuation of our imports, as given by the department statements, from the beginning of the government to the 30th June, 1855, amounts to 6983 millions of dollars; the exports for the same period of domestic and foreign merchandise and specie, to 6170 millions—a difference of 813 millions.

No conclusions whatever are drawn, either as to effect or amount of effect, from the data which our international account current thus offers, or seems to offer. The discussion which this point would awaken has been avoided as wholly unnecessary to the argument of this report, and possibly inconclusive and uncertain for any purpose. But although the enormous apparent balance against us in the account of our foreign trade be not reliable for the actual difference in our exchanges with the rest of the world, as it probably is not, yet the amount of the national, State, municipal, railroad, bank, and other corporation stocks and bonds held by foreigners, should be received as a subsisting balance of debt, resulting from a past balance of trade, which it must represent.

Effects of the present Tariff upon Wool-growers, Manufacturers, and upon the Revenue.—The tariff of 1846 unhappily raised the duty on all imported wools to 30 per cent., while it reduced the duty on imported flannels and blankets to 25 and 20 per cent., and on the coarser woolen fabrics to 25 per cent.

Now these low-priced manufactures of wool being the chief in quantity and value of which we were then capable, the business was prostrated by the premium which that act in effect offered to the foreign manufacturer; and the nominal protection of the wool-grower resulted in the ruin of his business, as in that of the cloth-maker. The home market was destroyed for the farmer; in the foreign he could not compete, and the flocks were sent to the slaughter, because the woolen factories had been sold at auction or converted to other services. The effects of this policy on the treasury are seen in the fact that twenty-two millions of the

surplus in the treasury, accumulated in the years 1853, 1854, and 1855, have come from customs upon woolens. In 1844 woolens yielded $3,313,495 to the customs, cottons $4,850,731; in 1855 woolens yielded $6,088,157, cottons but $3,823,294.

The cotton manufacture was protected; the woolen was abandoned; and while all the interests dependent upon it have been sacrificed, the revenue has been inflated at least four millions per annum during the last four years beyond what it would have received if the policy of the government had been as friendly to it as it has been to the cotton manufacturer; a striking illustration of the law that the certain method of limiting the amount of taxes is by limiting the amount of imports, by duties adequate to guarding the home-made commodity against extinguishment by the foreign.

Exemption of the coarser and finer Wools from Duty.—Your committee, looking straight at the question of the revenue, therefore, recommend you to exempt all wools of those qualities not generally grown in this country, costing less than fifteen and more than fifty cents per pound at the port of entry in the United States, from duty, retaining the existing tariff rate upon the intermediate qualities, and at the same time to raise the duties upon all woolen manufactures to the point of adequate protection.

The recommendation to fix the duty upon all such wools as our farmers now produce, or can easily produce, at 30 per cent., and to raise the duties upon all woolen fabrics into whose manufacture such wool enters, is made for the purpose of opening a market at home for the raw material which it can not find abroad, and diminishing the customs flowing into the treasury from woolen imports to the extent which such enhanced domestic production will replace them.

Magnitude of the Woolen Interest.—Special consideration to this interest is here given because of its magnitude, which may be estimated by the fact that, both in value of the imports and the amount of duty yielded to the treasury, woolen manufactures have been equal to those of iron, greater than cottons, and next in importance to silks, during the last ten years of our financial history.

The Secretary of the Treasury, noticing the great progress made in the manufacture and production of iron since the year 1840, states the fact that the American production in the year 1850 was $60,485,655, and the foreign import of the same year only $16,333,145, and says: "The conclusion is inevitable, that the production and manufacture of iron in the United States within a very short period of years will exclude the foreign production and manufacture." Of cotton he says: "That already the American manufacture is in possession of the home market as to all coarser fabrics, and beginning successfully the manufacture of the finer fabrics."

These are the good parts of a policy of protection so moderate that without the help of a number of independent causes, co-operating with the imposed duties, even these branches of the iron and cotton manufacture, to which the Secretary's report justly applies, would not have been sustained in the past, or given such flattering promises for the future. The protection extended to them, and which now appears in their prosperity, covers a period of not more than fourteen years, and has been efficiently operative for only about half of that time; yet, with all favoring influences concurring, under a stable policy, the enterprise and skill of our manufacturers may in time achieve a victory over the competition of cheaper and more abundant capital and labor abroad.

Depression of the Woolen Interest.—But our woolens have languished to the verge of extinction, while these two branches, of not more than equal importance, have so far prospered. In 1846 we imported for consumption $10,000,000 of woolens and $18,000,000 of cottons. In 1855 we imported for consumption $22,000,000 of woolens and only $15,500,000 of cottons, and exported of domestic cottons nearly $6,000,000; in the one case more than doubling our dependence upon foreign production, and in the other reducing it, in effect, 27 per ct.

Now we are just as capable of growing wool and manufacturing it as we are of the corresponding cotton production and manufacture. The territory of the United States, adapted to wool-growing, is as large and as favorable as all Europe possesses and devotes to the purpose; and if those qualities of the article which we do not or can not profitably cultivate were exempted from duty, and so afforded equally cheap to our own as to the foreign manufacturer, there is no natural cause in existence to prevent the immediate establishment of woolen factories sufficient to open a remunerating market for our farmers to an almost unlimited extent. There are portions of the United States in which the finest and best wool of the world has already been grown; and it is possible that this might in time be brought up to supply our entire demand for such first quality of staple; but it is certain that all the qualities between the finest and the coarsest could be supplied quite up to the demand of the market within five years from the establishment of an encouraging policy; and Congress is imperatively called upon now to decide whether so vast an interest as this shall be sustained or destroyed.

Protection to the Wool-grower and Manufacturer, or Destruction to one of the three greatest Branches of American Industry.—As the question now stands, moreover, let it not be overlooked that, if the manufacture shall be relieved of all weight which the duties upon all qualities of wool impose on it, by placing them in the free list, the wool-growing interests of the country may be seriously injured. If the manufacture is protected, as it must be by a duty of 30 per cent., the agriculturists will be taxed that much upon all the woolens they must use, while their own interests in the production of the fabrics are destroyed; and if woolens shall not be thus protected, then manufacturer and farmer are both overwhelmed, and the country is deprived of all share in one of the three greatest branches of human industry.

The consumption of woolens is at least equal in value to that of cottons in the United States, and to surrender their production and manufacture to destruction is so unwise that it is not to be supposed possible to an intelligent people. Let a home market for all the wool that can be profitably produced in this country be created by a change in the present tariff which will exempt the coarsest and finest qualities from duty, raise the duties on flannels, blankets, and those fabrics which require the middling qualities of wool which the United States can supply abundantly, and farmer and manufacturer will be restored to that prosperity of which they have been deprived, and the revenues will be reduced by the diminution of imports effected by the home supply, and all the objects of a just and wise legislation will be equally met.

Reduction of the Revenue by Protection of the Woolen Manufactures.—The customs have risen on woolens in eleven years from $3,313,495 to $6,088,157, while those on cottons have fallen from $4,850,731 to $3,823,294. Here we have a ratio of reduction in the revenue, from this source, which under parallel circumstances would, by its direct operation, reduce the annual surplus of the treasury at least four millions.

Add this probable reduction to the Secretary's estimate of the diminution promised by his proposed free list, and about nine millions of diminution in the annual revenue are fairly provided for—five millions immediately, and four millions just as soon as factories can be built, or those which have been converted from woolen to other manufactures can be restored; and sheep, which by natural increase more than double their number every year, can be reared to supply the demand.

Silks, Revenue from them.—Another and more immediately effective reduction of the revenues may be made by revising the tariff upon silks, so as to reduce the rates upon all qualities and kinds which do not compete with any established production of the article at home.

The imports have risen in value since 1847 from less than twelve to over twenty-four millions, and the customs from $2,833,850 to $6,129,583. In these nine years the total amount of duties received into the treasury from manufactures of silk is $51,893,871; while the total revenue from iron, manufactures of iron, and iron and steel, amount to only $50,136,942.

Luxuries, and the Rule for taxing them.—Silk manufactures stand highest in productiveness to the treasury of all articles enumerated in the tariff schedules. They owe this rank as sources of revenue, it seems to your committee, mainly to the misapplication of a general rule which has governed tariff legislation during those periods of financial necessity when import duties were resorted to to supply the treasury's deficiencies, and were felt to be a necessary increase of the burdens of taxation for revenue purposes. This rule holds, with some justice, that the wealthy shall contribute more liberally to the national wants than can be fairly demanded of the comparatively poor. Hence the maxim that luxuries should bear the highest revenue duties.

When this rule has the effect of lessening the burden of taxation upon the poor, it ought to have its operation; but when in altered circumstances, both of the national finances and the general condition of the people, it only operates to bar the people of moderate independence from the enjoyment of such luxuries without affording them a corresponding and compensating relief from taxation; it takes the character of ministering to the privileges of the rich, and preventing the otherwise possible enjoyment of luxuries by the whole people.

Luxury is a relative term, and must change its meaning or its application with all changes of condition in its subjects. Before the year 1832 tea and coffee were treated as luxuries by the previous tariffs, although they were more than sufficiently productive of revenue for all the wants of the government. By the act of that year they were put into the free list, probably because they did not enter into competition with any home production of a similar character and use, and possibly for the additional and equally good reason that a republican Legislature ought, by every legitimate use of the powers intrusted to it, aim at leveling up the comforts and enjoyments of the people of every condition to the better and higher that can by any means be brought within the reach of their industry and aspirations.

The imports of silk manufactures are greatly larger in value every year than those of wool; their consumption by the people of the United States must, therefore, be not only very large but very general, and whatever can be done to bring them more easily within the means of the whole community, which at the same time shall help to relieve the excess of annual revenue and damage no industrial interest of the nation, ought to be done.

For the like reasons, tropical fruits, spices, and other commodities not produced in the United States, or not embraced by, or adapted to, the industrial enterprise of our people, should be put under the same rule. With a sufficiency of revenue accruing to the treasury from other sources, the principle of free trade in all such commodities should have its utmost application in practice.

Reduction of Customs by enlarging the free List, encouraging Woolens and modifying Duties upon Silks, sufficient to relieve the Excess of Revenue.—In a judicious modification of the duties upon silks and other luxuries, your committee see a promised reduction of the revenue, based upon the statistical data before us, which, taken in connection with the measures already indicated, comes very well up to the amount of diminution demanded by the present and prospective exigencies of the treasury.

Calculations of revenue to be yielded by percentages, when the principal is of unsettled amount, and liable to be disturbed, not only by various other causes, but by the changes in the rate of duties adopted upon those calculations, are of course uncertain; but where there is nothing else to guide than estimates so based, they must be taken, and a future experience be left to settle their results into certainties. We can be safely confident that the measures which conform to the principles and laws of the subject will work in the direction intended, and this is sufficient assurance of correctness to warrant the trial. In this confidence, corroborated as it is by the teachings of the past, your committee submit these suggested changes of the present tariff for adoption.

Our System of Finance unsound and mischievous.—The management of the national revenue so as to adjust it fairly to the national expenditure, keeping the policy well within the constitutional powers of the government, and conforming it at the same time to the movements and interests of our national industry in all its vast varieties and values, is a problem which has not yet been satisfactorily solved in the practice of the government. Deficiencies and excesses have alternated in the treasury so rapidly and so largely in our past experience, that Congress is at length fairly driven from the ground of temporary experiments, and compelled to search for the principles that naturally rule the subject.

The Policy of Industrial Independence.—If the experience of mistakes teaches any thing clearly and reliably, our tariff histories are full of evidence that our home affairs can not be safely left to foreign influences, and that the accidents which lie in wait for them are not to be prevented by abandoning all legislative care of them. A nation must govern itself, or its neighbors will; and that for their own purposes and profit. If the United States were exclusively a manufacturing, or as exclusively an agricultural people, absolute free trade would be their policy, and custom-houses an absurdity.

The most extensive trade which they could attain to with foreign nations would then be their highest interest, and direct taxation for the support of the government the soundest system of national finance.

But our manufactures have now quite reached to the value of our agricultural products. Fifteen hundred millions of dollars per annum is the value of each of these two great classes of productive labor, according to the estimate of the most reliable authority; and it is neither in the character nor destiny of this great people to endure a perpetual dependence upon foreign nations for the products of skilled industry which they need for every-day consumption. British legislation aimed at restraining us, while we were her colonies, to the production of raw material from her market. If our own system were permitted to drift to the same result, we should, by our own act, voluntarily restore her empire over us in the only particular that is, or ever was, a substantial object of her ambition, and our Revolution would be a failure in every thing but the boast of political independence.

The despotism of wealth fears no rebellions; predestinated poverty has no independence to assert. Its spirit and its necessities are passive submission. The rights and liberties of a nation are declared in its political constitution, but their substance is in the industrial independence of the people. True freedom is found only in the command that men have over the resistance of the forces of nature to their dominion; and a people which achieves the control of their own conditions are never the slaves of any other power.

Dependence upon a foreign people for a market, either for agricultural or mechanical products, is industrial vassalage.

England has made herself the work-shop of the world by a viciously exaggerated system of manufacturing; and she depends day by day upon the world's unnatural submission to her system for her prosperity.

Turkey abandoned the guardianship of her prosperity to foreign dominion, and has sunk from the rank of a first-rate power in the earth to the very verge of national ruin. Her internal trade is wholly in the hands of foreign hucksters, as her national integrity is under the guardianship of foreign sovereigns. A people impoverished by a system of the lowest and least remunerative industry, and degraded in character and spirit by its necessary ignorance and feebleness, is inevitably at the mercy of its superiors in these respects.

The American people, of the same lineage, equal skill and enterprise, superior inventive genius, and holding a better territory by all the difference of its extent and variety of climate, soil, and commercial relations, as compared with Western Europe, can not possibly be held to inferior and subordinate industrial avocations.

The necessary command of our welfare, the current disposition of our own affairs, imperatively demand that we shall guard ourselves against all injurious foreign agencies and influences, by a settled system of self-defense.

Home and foreign Market for Provisions and Breadstuffs.—The home market for all our products now is at twenty-seven hundred and fifty millions to two hundred and fifty millions; but the corresponding two hundred and fifty millions of imports, for which we exchange our surplus, has the power to disturb and distract our currency, domestic exchanges, and domestic industry, to an extent which puts the treasury of the nation and the prosperity of the people at the mercy of every fluctuation in the market of London. We must conquer our independence of the money power of Europe, and we must control our national finances into conformity with our own necessities. This, it is obvious, can be done only by bracing the home market against all disturbing agencies.

The mischievous error of preferring a foreign to the home market for breadstuffs and provisions, and seducing the agriculturist into the policy of favoring it, is clearly exposed and convincingly proved by the following statement:

The population of Great Britain and Ireland is..	27,000,000
American breadstuffs and provisions shipped to the United Kingdom in 1855.....	$15,392,343
Consumption per capita	57 cents.
Workmen employed in making the iron imported from Great Britain in 1855	60,518
Representing in families of five persons each....	302,590
Three hundred and two thousand five hundred and ninety persons, at fifty-seven cents each, worth of provisions and breadstuffs	$172,476
Three hundred and two thousand five hundred and ninety Americans would consume of our provisions and breadstuffs fifty dollars each...	15,129,500

or within a trifle of the whole amount taken from us by the 27,000,000 of British people for that year.

To bring the iron imported in 1855 to the United States the equivalent of 70 American and 18 foreign vessels were entirely supported, counting the cargoes both ways. The tonnage of American vessels average 931 tons each, and they carry crews of 24½ men each, or in all, Americans, 1563; 18 foreign vessels, of 733⅓ tons each, and crews of 21⅔ men each, equal to 390 men. Each vessel is estimated to make three trips in the year, carrying six cargoes. The vessels represent a capital equal to $50 per ton.

American capital employed in carrying this iron is 65,170 tons, at $50.....	$3,258,500
British capital in 13,203 tons of shipping, at $50..	660,150
Total capital in the shipping.....	$3,918,650

Summary of Employment.

	Men.	Persons supported.
Englishmen in manufacturing ..	60,518	302,590
Englishmen in shipping	390	1,950
Americans in shipping	1,563	7,815
Total.....	62,471	312,355

Summary of Capital.

British in production of iron	$75,000,000
British in shipping.....	666,150
	75,666,150
Americans in shipping	3,258,500
Total capital supported.....	$78,924,650

Summary of Breadstuffs and Provisions.

Consumed by the British people in making iron, 302,590, at 57 cents	$172,476
In shipping, 1,950, at $5	9,750
304,540	$182,226
By Americans in shipping, 7815 men, at $50.....	390,750
Total.....	$473,976

Had the iron been made in the United States, 302,590 persons would have consumed, at $50 each, $15,129,500.

The result is, that we supported in the importation of foreign iron, in the year 1855—

Foreign capital	$75,666,150
Foreign people, 304,540.	
American capital	3,258,500
American people, 7815.	
We gained a market for breadstuffs and provisions of.....	4,722,976
And we lost a market for breadstuffs and provisions of.....	15,129,500
Loss to American farming interest, a market for	$14,656,676

The facts and figures of every other kind of imported commodities which a home production would exclude are data for a similar calculation of loss to the agricultural interest of this country.

International Exchanges.—The surplus provisions and breadstuffs which we might produce, after an evenly balanced and independent system of manufacturing should be established, would be the legitimate subject for foreign commerce, contributing to our necessary exchanges with other nations, and thus to the general welfare; but shipped at such a loss in amount and value, as they must be while they are injudiciously denied a home consumption, the undue amount of their export measures our distance from a healthy system, and from the wealth, prosperity, and independence which a true policy would secure to us.

Agricultural home Market against the foreign.—It is only the least profitable of the farmer's crops which will bear distant voyages in search of a market, and all excess which his exports find or make abroad falls back in diminished prices upon the hundred-fold stock which he sells at home, sometimes scarcely repairing by the whole net value of the exports the diminution of price which they reactively inflict upon the domestic market. For his green crops, fruits, and garden stuffs, his poultry, veal, mutton, and dairy products, he must have a market at home, or he must abandon their culture for sale. His land may be made to yield him thirty or forty dollars per acre in transportable grain, less the cost of cultivation, or he may make its product marketable abroad and worth about as much by feeding it to stock; but he can neither diversify his crops, nor maintain the fertility of his land against such a system of exhaustion; and, above all, he will not be able to make it yield three times the value of such crops in those vegetables which, with a well-sustained home market, is easily effected The difference between the market value and the profit of a farm in the Far West, and one of an equal quantity of land adjacent to a large city, illustrates the difference between a market at hand for all possible agricultural products, and a foreign one with an ocean intervening.

The farmer's wool crop has been amply protected for nine or ten years, so far as a high tariff duty upon imported wool could do, or promise to do it; but his home market has been destroyed by a countervailing

legislation leveled against the manufacturer. The opportunity of a foreign market could not tempt, as it would not reward, him for his industry in that direction. If the agriculturists of this country but considered the subject, they would discover that the market opened to them abroad for the produce of their fields is no better than for their wool.

In the year 1855 the total exports of breadstuffs and provisions from the United States fell short of thirty-nine millions of dollars. What is this to the crop of the year, worth fifteen hundred millions, that the American farmer should sacrifice the custom of a neighboring blacksmith, shoemaker, or weaver to secure it? In amount it is but the fortieth part of his crop, and one family next door to him would consume it more profitably for him, and with greater certainty of demand. Prices may be high or low under the influence of accidental causes, but the laws of nature and the principles of trade are a safe directory in any combination of circumstances; their bearing upon national policy is absolute and unvarying, and they must be obeyed or they will be avenged.

Harmony of all Industrial Interests, and Adjustment of the best economical Policy to the Necessity of the national Treasury. — That a harmony of interests naturally and necessarily exists among all the departments of national industry is a fundamental principle in political, as it is in social and religious science. It is one of those first principles which stand incontrovertible as the data of all reasoning upon the policy of human societies. So far as this inquiry has proceeded, the truth of this principle is clearly supported; and it can not be doubted that the other branches of productive and commercial business, not specially considered, must fall within the rule with an equally happy accordance. If an integral, self-sustaining, well-balanced relation holds between the manufacturing and agricultural welfare of the nation, and if the policy which is best for them is also well adjusted to the requirements of our system of national finance, the true interests of the planter, the navigator, and the merchant can not possibly be at war with them.

Cotton and Commerce.—It would exceed the limits as well as the proper province of this report, to endeavor a formal demonstration of its doctrine as it applies to cotton and commerce, and it must, therefore, be forborne; but some general considerations, which may be suggested in its support, will serve to show "the equal operation of the policy throughout the Union, discriminating neither for nor against any class, section, or interest," conformably with that maxim of our legislative system which has the dictates of justice and the spirit of the federal constitution for its authorities.

Export of Gold; Effects upon the Planting Interest.— In the first place, the system which looks to the industrial independence of the country would necessarily have the effect of retaining the gold exported to foreign countries for the purchase of all those commodities which we might advantageously manufacture for ourselves. The two hundred millions which we have sent abroad within the last six years is an excessive export, by the amount to which it has diminished the necessary home supply, and raised the rate of interest to its present inordinate height. Scarcity of capital and extravagant rates of loans leave no interest of the country uninjured, except that of the wealthy moneyholder.

At the place to which money flows it is most abundant and cheapest. The rates in London do not average more than half those that are constantly paid in our Atlantic cities, and often stand at one-third, or even lower.

Capital at 10 per cent. interest, exposed to the competition of capital at 5, has a fearful odds to contend with; but it is abundance against scarcity which is even more disastrous than the difference of rates. A prosperous business man may endure heavy interest, but a small capital must encounter the fluctuations of the market without relief, and is swamped in a storm which the heavier craft will ride out under bare poles. From the revulsions which our monetary affairs periodically suffer from this cause, no department of production or trade escapes, and the planters are usually the earliest and severest sufferers. They are most shaken by depression of prices, and by bankruptcy of their customers, from the fact that their industry is less varied, and the commodities which they require for constant consumption are less within their reach, when business is embarrassed. They must bring them from abroad, where credit and confidence are not so easily commanded as at home.

Fixed capital commands credit within the country, but mortgages are not negotiable securities at a distance.

Limit to Exportation of the precious Metals. — The drain of the precious metals, unduly induced by the import of articles which ought to be made at home, is an evil of such magnitude, that if there were not another among the incidents of excessive importation, it would of itself deserve the utmost exertion of legislative power to correct it. It is utterly from the purposes of a sound policy to speak of gold as a product of the country, and a commodity of trade, like iron or cotton, while its export is carried to the extent of crippling business, disturbing the currency, and enormously enhancing the rate of interest. However produced or derived, it is *money* to the extent required for the health of the circulation and the prosperity of business, and any policy which runs the supply below the demand is suicidal.

Cotton and Iron Manufactures in the South.—In the next place, the older planting States are not only capable of the labor of converting their raw material, both cotton and iron, into at least the coarser fabrics which are conveniently and profitably marketable, but they are now under the compulsion of necessity to so far diversify their industry, and so to divert some portion of their labor from the one business which they have been so long helping to depress, and to derive from this change the better remuneration which the work of conversion affords above that of production.

Georgia, Virginia, and North Carolina made the experiment of applying a portion of their cheaper labor to the coarser cotton fabrics, with a success which promised fairly to give them the home-market in a few years for such articles; but New England was compelled to dispute this ground with them by the failure of the tariff of 1846, to give the more advanced manufacturers of the North the opportunity of making the finer fabrics in the then existing condition of the enterprise, and the South for the time was thrown back upon her staples and a foreign market for her dependence.

Protective Policy no longer a Party or sectional Question.—But the spirit of progress, and the change of conditions which nine years have brought with them, have wrought their necessary changes in the movements of the whole country, and given us the happy promise of a better union in interests and policy than we have known in the past.

The time and the occasion for harmonizing measures are now upon us, and the fond faith which we hold in the future destiny of the Union warrants the confidence that this great people will show both the wisdom and virtue of a genuine patriotism in the settlement of all their differences.

A common Prosperity corrective of social Strifes. — Every section of the Union should be the best judge of its own policy; at all events, it will determine it for itself; but it is a happy circumstance for the United States that, in *the things which work their way determinately into the destiny of the nation*, there exists so little contrariety of opinion, and so much less difference

of drift, that there is nothing substantial required to be sacrificed by any part of the country for the good of the whole, and very little even in speculative opinion to be compromised to effect an agreement.

The people may be agitated and divided upon constitutional, moral, and religious questions, and their discussion and settlement will have proportionate effect upon the general harmony, but the measures which carry with them a general prosperity will hereafter, as heretofore, bear them through every strife, and secure the general welfare.

The prosperity of navigation, foreign, coastwise, and internal, are necessarily so directly dependent upon the productiveness and wealth of the agricultural and manufacturing business of the nation, that the simplest definition of its functions contains the proof of our proposition. It is the common carrier of all exchanges. Its business is proportioned to, as it is dependent upon, production, and must grow with all growth, and decline with all diminution of the products demanding its agency.

Relations of the Trader and the Laborer, and the Compensations of a general Progress for all Changes.—A sound political policy looks to a constant diminution of the proportionate number of intermediates between the producer and consumer.

All the modern improvements in the methods and instruments of commerce tend to the accomplishment of this great aim. Time, distance, and cost of transportation are in rapid progress of abridgment, and middlemen are, in corresponding ratio, eliminated by the process. Yet all these movements toward a better and directer relation between men whose reciprocating industries require improved conditions of intercourse is found to work as well for all the dependent as for the principal functionaries in the world's commerce. Steam has been largely substituted for human and brute power on the great thoroughfares of trade and travel, but horses have increased in number and value in direct proportion to the growth of the agency which threatened to deteriorate them. Wages and demand for human labor have, in like manner, risen under the auspices of the machinery that now does so much of the work which formerly belonged to them. All the natural labor in the nation bears but a small proportion to the artificial, which has so largely replaced it in production and transportation; yet that natural labor was never so fully employed nor so well rewarded as now; and the same law holds for every business function of society, and every species of employment which has any legitimate place or use in human life.

STATEMENT SHOWING THE CHANGES THAT HAVE TAKEN PLACE IN OUR TARIFF POLICY SINCE THE FORMATION OF THE CONSTITUTION, VIZ.:

Date.	Character of Change.	
1789....July 4,	First Tariff adopted.	
1790....August 10,	General change.	
1791....March 3,	General	"

1857....March 3,	General	"

Year 1824.—The tariff change of this year created considerable discussion and feeling. The duties collected that year were $17,878,000, with a population of 12,000,000, or $1 50 to each individual.

1828.—The general change this year was accompanied by a light increase of duties; viz., $22,681,000.

1832.—Another general change took place, followed by a rapid increase of duties after 1834, viz.:

Years.	Duties.	
1833	$29,032,000	
1834	16,214,000	$1 10 per head.
1835	19,391,000	
1836	23,409,000	$1 60 per head.

The collapse of 1837 led to a reaction, and the duties diminished for 1837–'38, showing as follows:

Years.	Duties.	Years.	Duties.
1837	$11,169,000	1840	$13,499,000
1838	16,158,000	1841	14,487,000
1839	23,137,000	1842	18,187,000
Population, 1840			17,063,000

Since the latter date the duties have increased from $1 per head to about $2 50 per head, viz.:

Years.	Duties.	Years.	Duties.
1846–'47	$23,747,500	1851–'52	$47,339,000
1847–'48	31,757,000	1852–'53	58,931,000
1848–'49	28,346,000	1853–'54	64,224,000
1849–'50	29,668,000	1854–'55	53,025,000
1850–'51	40,017,000	1855–'56	64,022,000

Since the year 1789, the aggregate revenue from all sources has been $1,886,740,084, viz.:

From customs	$1,327,151,599
From public lands	164,008,825
From miscellaneous	395,519,636
Total returns	$1,886,740,084
Total disbursements	1,837,721,045

for a period of sixty-eight years; viz., from March 4, 1789, to June 30, 1856.

By the Constitution of the United States it is provided that "no State shall, without the consent of Congress, lay any impost or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and all such laws shall be subject to the revision and control of Congress."

The following statement has been furnished showing the changes from one rate of duty to another, as made by the tariff act of the year 1857, when applied to the importations of the year ending 30th June, 1856:

Value.	Rate, Act of 1846.	Rate, Act of 1857.
$4,552	from 40 per cent.	to 15 per cent.
25,282 "	30 "	to 15 "
277,310 "	40 "	to 8 "
321,359 "	30 "	to 8 "
12,552 "	25 "	to 8 "
449,028 "	20 "	to 8 "
697,929 "	15 "	to 8 "
153,276 "	25 "	to 4 "
2,206,360 "	20 "	to 4 "
172,170 "	15 "	to 4 "
8,315,313 "	10 "	to 4 "
1,665,930 "	30 "	Free.
70,146 "	25 "	"
153,720 "	20 "	"
1,546,715 "	15 "	"
190,778 "	10 "	"
6,929,471 "	5 "	"
The loss of revenue by additions to the free list is		$1,145,615 90
Loss of revenue by transfers to Schedule H, or 4 per cent.		775,535 67
Loss of revenue by transfers to Schedule G, or 8 per cent.		263,247 41
Loss of revenue by transfers to Schedule E, or 15 per cent.		4,922 80

Subjoined is a statement exhibiting the revenue which the importations into the United States, in the year ending 30th June, 1856, would produce under the tariff act of 1857:*

* This includes an approximation to all the changes made by the new tariff, except bleached, printed, painted, and dyed manufactures of cotton, and of delaines transferred from Schedule D to C (or 15 to 24 per cent.), and of japanned leather or skins, transferred from Schedule E to D (or 20 to 30). These changes, raising from a lower to a higher schedule, would increase the aggregate above given equal to the difference made by the transfer, and in proportion to the amount of such importations, which are not returned in such a manner as to be separated from other similar goods.

Schedule.	Value of Imports.	Rate of Duty.	Amount of Duties.
A.....	$4,001,575	30 per cent.	$1,200,472 50
B.....	8,662,188	30 "	2,598,656 40
C.....	94,159,240	24 "	22,598,219 76
D.....	71,074,265	19 "	13,504,110 35

British Tariff.—The following are some of the most important regulations of the British tariff:

Overpayments of duty made in error may be returned, if claimed within six years after date.

In case of dispute as to the proper rate of duty, the importer to deposit the amount of duty demanded, and such deposit shall be deemed the proper duty payable, unless an action be brought or commenced within three months. In the event of such action being determined against the revenue, full indemnity to be made to the importer.

The Board of Customs may remit or mitigate penalties incurred through inadvertence, or non-compliance with existing regulations.

The duties on the following goods must be paid on the first importation, and such goods shall not be warehoused for home consumption or exportation: viz., corn, grain, meal, and flour, and wood goods from British possessions.

Diamonds, bullion, lobsters, and fresh fish of British taking, may be landed without report or entry; no other goods can be unshipped or landed, except with the authority of an officer of the customs.

Where *ad valorem* goods shall have been detained as undervalued, the officers shall give a written notice of such detention to the person entering the same, and of the value thereof as estimated by them. If such goods be retained for the use of the crown, the value entered with an addition of 5 per cent., and the duties already paid on such entry, to be paid to the owner.

Goods not entered, or landed within fourteen days after the arrival of the ship, may be conveyed to the queen's warehouse; and if the duties and charges due upon such goods be not paid within three months, they may be sold, and the overplus, if any, paid to the proprietor.

Bonded goods to be cleared within five years, unless the proprietor desire to re-warehouse them, in which case they shall be examined, and the duties due upon any deficiency ascertained and paid.

If such goods be not cleared or re-warehoused within the said period, they shall be sold to defray duties and charges.

No person shall export bonded goods in any ship of less burden than fifty tons, except to the islands of Guernsey and Jersey, by regular traders not being of less than forty tons burden.

No drawback shall be allowed on goods of less value than the drawback claimed, and all such goods so entered shall be forfeited, and the person who caused them to be entered shall forfeit the sum of £200.

No tobacco, cigars, or snuff shall be imported into the Channel Islands in ships of less than 120 tons burden, nor unless in hogsheads or chests, each containing not less than two hundred pounds' weight of such tobacco or snuff, nor unless in packages each containing not less than one hundred pounds' weight of such cigars, tobacco, or snuff, not being in any manner separated or divided within such package.

The island of Malta and its dependencies shall be deemed to be in Europe.

Any person making a false declaration in any document relating to the customs, or answering untruly authorized questions put to him by the officers of customs, liable to a penalty of £100.

In case it shall appear that British vessels are subject in any foreign country to restrictions as to the voyages in which they may be engaged, or the articles imported or exported, it shall be lawful for her majesty to impose similar restrictions upon the ships of such foreign country.

No foreign goods upon which a higher duty is payable on their importation into Great Britain than on their importation into the Isle of Man, shall, after they have been delivered out of charge of the customs in the said isle, be shipped into Great Britain.

Comparative Tariffs.—The following comparative statement exhibits the gross amount of duties received upon the principal articles of foreign and colonial merchandise in Great Britain and France, respectively, during the year 1856, to which we have annexed a column showing the gross amount of duties received by the United States upon similar articles during the same year:

Articles.	Great Britain.	France.	United States.
Cocoa	$78,390	$540,520	$11,807
Coffee	2,936,820	4,010,020	11,372
Wheat	1,027,005	397,680	500
Oats	289,205	4,019	198
Rye	1,005	965	....
Barley	183,080	3,770	318
Indian corn	447,060	18,660	....
Opium	10,005	2,235	97,169
Rice	139,910	40,720	....
Casaia lignea	2,875	4,520	67,880
Cinnamon	1,835	1,765	6,343
Cloves	8,945	12,090	21,231
Mace	6,830	270	9,563
Nutmegs	53,275	3,570	130,453
Pepper	404,445	210,405	95,820
Pimento	5,015	9,175	140,808
Rum	6,945,095	63,990	288,494
Sugar	25,918,385	12,071,960	6,720,106
Tallow	342,285	90,315	302
Tea	27,631,205	57,840	7,864
Watches	77,110	70,220	880,075

The following comparative statement exhibits the amount of duties paid on the articles specified, in France and the United States, respectively, in the year 1856, all of said articles being admitted free of duty in Great Britain:

Articles.	France.	United States.
Brimstone	$43,005	$24,525
Cotton, raw	3,870,115	Free.
Cochineal	46,885	24,905
Indigo	124,175	106,374
Flax	245,315	19,869
Guano	146,210	Free.
Hemp	24,805	553,503
Hides	26,835	404,164
Mahogany	113,210	88,049
Iron in bars	125,135	1,005,885
Steel, unwrought	295,695	422,747
Lead	295,680	505,603
Spelter	7,245	20,351
Tin	9,030	728,661
Oil, whale	5,805	1,534
Oil, palm	41,575	41,631
Olive-oil	429,480	141,149
Beef, salted	8,230	124
Pork, salted	6,985	
Quicksilver	375	725
Silk, raw	29,155	151,160
Tar	9,050	....
Wool	1,038,730	496,519

The total amount of customs duty in France in 1856 was $35,330,405, on a total value of $397,955,235, or 8·87 per cent. on the whole amount; the total amount in Great Britain was $131,034,220; and the total amount in the United States was $64,022,863. If to the $35,330,405, the amount of customs paid into the French treasury in 1856, we add $36,416,640, chiefly realized from the tobacco monopoly, but made up in part also of the export duty on wines, we have $71,747,045, or amount of customs duties received by the three countries in 1856, as per existing tariffs:

Great Britain	$131,034,220
France (including revenues from tobacco and wines)	71,747,045
United States	64,022,863

The following table exhibits the comparative tariffs of the United States, Great Britain, France, Spain, Holland, Belgium, and Brazil, in regard to the principal articles exported from the United States.

COMPARATIVE STATEMENT EXHIBITING THE IMPORT DUTY LEVIED IN GREAT BRITAIN, FRANCE, AND HOLLAND ON GOODS, WARES, AND MERCHANDISE, OF THE GROWTH, PRODUCE, AND MANUFACTURE OF THE UNITED STATES; ALSO THE DUTY ON LIKE GOODS, WARES, AND MERCHANDISE IMPORTED INTO THE UNITED STATES.

From an examination of the comparative duties on different articles, we find that the tariff of Great Britain more nearly approaches free trade than any other. The United States and Holland follow next in order, and Spain and Brazil are the nearest the other extreme—making, in fact, protection almost prohibition. There is a great want of uniformity in the tariff charges generally, with the exception of those of the United States. In the tariffs of Spain and Brazil the duties seem to be levied arbitrarily in regard to home production, etc., and the tariff considered only in reference to the maximum duty under which the separate articles will be imported, and the total possible maximum revenue.

In the articles of every-day consumption, such as flour, provisions, etc., the tariff of Spain shows almost a prohibition, while articles of luxury are admitted on low duties.

The commerce of the United States with these countries in 1857 was in proportion to the total commerce of the country, as follows:

Year ending June 30, 1857.	Exports from United States.	Imports into United States.	Total.
Great Britain	$185,845,784	$131,003,193	$316,848,977
France	38,238,987	47,792,827	86,031,814
Spain	10,703,097	2,723,016	13,426,113
Holland	4,107,877	2,469,762	6,577,639
Belgium	5,614,226	5,060,511	10,704,737
Brazil	5,845,207	21,460,732	27,305,940
Other countries	112,875,494	150,380,299	263,255,793
Total	$362,960,682	$360,890,141	$723,850,823

From this table it appears that the six countries of which we have given a tariff summary had the following proportion of the commerce of this country for the fiscal year 1857:

In the exports from United States ..... 69 per cent.
In the imports into " ..... 58 "
In the total commerce of " ..... 64 "

If we had included the colonies of the above countries, which have the same tariff regulations as their mother countries the percentage would have been materially increased.

COMPARATIVE STATEMENT EXHIBITING THE IMPORT DUTY LEVIED IN SPAIN, BELGIUM, AND BRAZIL ON GOODS, WARES, AND MERCHANDISE, OF THE GROWTH, PRODUCE, AND MANUFACTURE OF THE UNITED STATES; ALSO THE DUTY ON LIKE GOODS, WARES, AND MERCHANDISE IMPORTED INTO THE UNITED STATES.

NEW TARIFF ACT OF THE UNITED STATES.

AN ACT REDUCING THE DUTY ON IMPORTS, AND FOR OTHER PURPOSES

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That on and after the 1st day of July, 1857, *ad valorem* duties shall be imposed, in lieu of those now imposed upon goods, wares, and merchandise imported from abroad into the United States, as follows, viz.:

Upon the articles enumerated in Schedules A and B of the tariff act of 1846, a duty of 30 per cent., and upon those enumerated in Schedules C, D, E, F, G, and H of said act, the duties of 24 per cent., 19 per cent., 15 per cent., 12 per cent., 8 per cent., and 4 per cent., respectively, with such exceptions as hereinafter made; and all articles so imported as aforesaid, and not enumerated in the said schedules, nor in Schedule I, shall pay a duty of 15 per cent.

SEC. 2. *And be it further enacted*, That all manufactures composed wholly of cotton, which are bleached, printed, painted, or dyed, and de laines, shall be transferred to Schedule C.

Japanned leather, or skins of all kinds, shall be transferred to Schedule D. Ginger, green, ripe, dried, preserved, or pickled; ochreys and ochrey earths, medicinal roots, leaves, gums and rosins in a crude state, not otherwise provided for; wares, chemical, earthen or pottery, of a capacity exceeding ten gallons, shall be transferred to Schedule E.

Borate of lime and cedella, or tow of hemp or flax, shall be transferred to Schedule F.

Antimony, crude or regulus of; barks of all kinds, not otherwise provided for; camphor, crude; cantharides; carbonate of soda; emery, in lump or pulverized; fruits, green, ripe, or dried; gums, Arabic, Barbary, copal, East India, Jeddo, Senegal, substitute, tragacanth, and all other gums and rosins in a crude state; machinery exclusively designed and expressly imported for the manufacture of flax and linen goods; sponges; tin in plates or sheets, galvanized or ungalvanized; woods, namely, cedar, lignum vitæ, ebony, box, granadilla, mahogany, rose-wood, satin-wood, and all cabinet woods, shall be transferred to Schedule G.

Acids, acetic, benzoic, boracic, citric, muriatic, white and yellow, oxalic, pyroligneous and tartaric, and all other acids of every description used for chemical or manufacturing purposes, not otherwise provided for; aloes; amber; ambergris; anise seed; annato, roncon or Orleans; arsenic; articles not in a crude state, used in dyeing or tanning, not otherwise provided for; asafœtida; asphaltum; barilla; bleaching powder, or chlorid of lime; borax, crude; boucho leaves; brimstone, crude, in bulk; cameos, mosaics, diamonds, gems, pearls, rubies, and other precious stones (not set); chalk; clay; cochineal; cocoa, cocoa-nuts, and cocoa-shells; cork-tree bark; cream of tartar; extract of indigo; extracts and

decoctions of logwood and other dye woods, not otherwise provided for; extract of madder; flint, ground; grindstones; gutta percha, unmanufactured; India rubber in bottles, slabs, or sheets, unmanufactured; India rubber, milk of; indigo; lac spirits; lac sulphur; lastings, cut in strips or patterns of the size and shape for shoes, slippers, boots, bootees, gaiters, or buttons exclusively, not combined with India rubber; manufactures of mohair cloth, silk twist, or other manufactures of cloth suitable for the manufacture of shoes, cut in slips or patterns of the size and shape for shoes, slippers, boots, bootees, gaiters or buttons exclusively, not combined with India rubber; music printed with lines, bound or unbound; oils, palm, teal, and cocoa-nut; Prussian blue; soda ash; spices of all kinds; watch materials and unfinished parts of watches and wood, or pasted, shall be transferred to Schedule H.

SEC. 3. *And be it further enacted*, That on and after the 1st day of July, 1857, the goods, wares, and merchandise mentioned in Schedule I, made part thereof, shall be exempt from duty and entitled to free entry.

SCHEDULE I. All books, maps, charts, mathematical, nautical instruments, philosophical apparatus, and all other articles whatever imported for the use of the United States.

All philosophical apparatus, instruments, books, maps, and charts; statues, statuary, busts and casts of marble, bronze, alabaster, or plaster of Paris; paintings and drawings; etchings; specimens of sculpture; cabinets of coins, medals, gems, and all collections of antiquities: *provided* the same be specially imported, in good faith, for the use of any society incorporated or established for philosophical or literary purposes, or for the encouragement of the fine arts, or for the use or by the order . any college, academy, school, or seminary of learning in the United States; animal carbon (boneblack); animals, living, of all kinds; argol, or crude tartar; articles in a crude state used in dyeing or tanning, not otherwise provided for.

Bark, Peruvian; bells, old, and bell-metal; berries, nuts, flowers, plants, and vegetables used exclusively in dyeing, or in composing dyes, but no article shall be classed as such that has undergone any manufacture; bismuth; bitter apples; bolting-cloths; bones, burned, and bonedust.

Books, maps, and charts imported by authority of the Joint Library Committee of Congress for the use of the library of Congress: *provided* that if in any case a contract shall have been made with any bookseller, importer, or other person for books, maps, or charts, in which contract the bookseller, importer, or other person aforesaid shall have paid the duty, or included the duty in said contract, in such case the duty shall not be remitted; brass in bars and pigs, or when old, and fit only to be remanufactured; Brazil-wood, brasiletto, and all other dye-woods in sticks; bullion, gold and silver; burr stones, wrought or unwrought, but unmanufactured.

Cabinets of coins, medals, and other collections of antiquities; coffee and tea, when imported direct from the place of their growth or production in American vessels, or in foreign vessels entitled by reciprocal treaties to be exempt from discriminating duties, tonnage, and other charges; coffee, the growth or production of the possessions of the Netherlands, imported from the Netherlands in the same manner; coins, gold, silver, and copper; copper ore; copper, when imported for the United States Mint; copper, in pigs or bars, or when old and fit only to be remanufactured; cotton; cutch.

Dragon's-blood.

Felt, adhesive, for sheathing vessels; flax, unmanufactured.

Garden seeds and all other seeds for agricultural, horticultural, medicinal, and manufacturing purposes, not otherwise provided for; glass, when old and fit only to be remanufactured; goods, wares, and merchandise, the growth, produce, or manufacture of the United States, exported to a foreign country and brought back to the United States in the same condition as when exported, upon which no drawback or bounty has been allowed: *provided* that all regulations to ascertain the identity thereof, prescribed by existing laws, or which may be prescribed by the Secretary of the Treasury, shall be complied with; guano.

Household effects, old and in use, of persons or families from foreign countries, if used abroad by them, and not intended for any other person or persons, or for sale.

Ice; ivory, unmanufactured; junk, old.

Linseed, but not embracing flaxseed.

Madder root; madder, ground or prepared; maps and charts; models of inventions and other improvements in the arts: *provided* that no article or articles shall be deemed a model or improvement which can be fitted for use.

Oakum; oil, spermaceti, whale and other fish, of American fisheries, and all other articles the produce of such fisheries.

Paintings and statuary; palm leaf, unmanufactured; personal and household effects (not merchandise) of citizens of the United States dying abroad; plaster of Paris or sulphate of lime, unground; platina, unmanufactured.

Rags of whatever material, except wool; ratans and reeds, unmanufactured.

Sheathing copper, but no copper to be considered such and admitted free, except in sheets of forty-eight inches long and fourteen inches wide, and weighing from fourteen to thirty-four ounces the square foot; sheathing metal, not wholly or in part of iron, ungalvanized; shingle bolts, and stave bolts; silk, raw, or as reeled from the cocoon, not being doubled, twisted, or advanced in manufacture in any way; specimens of natural history, mineralogy, or botany; substances expressly used for manures.

Tin in pigs, bars, or blocks; trees, shrubs, bulbs, plants, and roots, not otherwise provided for.

Wearing apparel in actual use, and other personal effects (not merchandise); professional books, implements, instruments, and tools of trade, occupation or employment, of persons arriving in the United States: *provided* that this exemption shall not be construed to include machinery or other articles imported for use in any manufacturing establishment, or for sale.

Sheep's wool, unmanufactured, of the value of 30 cents per pound or less at the port of exportation, and hair of the alpaca, the goat, and other like animals, unmanufactured: *provided* that any wool of the sheep, or hair of the alpaca, the goat, and other like animals, which shall be imported in any other than the ordinary condition, as now and heretofore practiced, or which shall be changed in its character for the purpose of evading the duty, or which shall be reduced in value by the intentional admixture of dirt, or any foreign substance, to 20 cents per pound or less, shall be subject to pay a duty of 24 per cent. *ad valorem*, any thing in this act to the contrary notwithstanding.

SEC. 4. *And be it further enacted*, That all goods, wares, and merchandise which shall be in the public stores on the 1st day of July aforesaid, shall be subject, on entry thereof for consumption, to no other duty than if the same had been imported respectively after that day.

SEC. 5. *And be it further enacted*, That on the entry of any goods, wares, and merchandise imported on and after the 1st day of July aforesaid, the decision of the collector of the customs at the port of importation and entry, as to their liability to duty or exemption therefrom, shall be final and conclusive against the owner, importer, consignee, or agent of any such goods, wares, and merchandise, unless the owner, importer, consignee, or agent shall, within ten days after such entry, give notice to the collector in writing of his dissatisfaction with such decision, setting forth therein distinctly and specifically his grounds of objection thereto, and shall, within thirty days after the date of such decision, appeal therefrom to the Secretary of the Treasury, whose decision on such appeal shall be final and conclusive; and the said goods, wares, and merchandise shall be liable to duty or exempted therefrom accordingly, any act of Congress to the contrary notwithstanding, unless suit shall be brought within thirty days after such decision for any duties that may have been paid or may hereafter be paid on said goods, or within thirty days after the duties shall have been paid, in cases where such goods shall be in bond.

AN ACT TO AM[illegible] THE ACT REDUCING THE DUTY ON IMPORTS, AND FOR OTHER PURPOSES, PASSED JULY 30, 1846.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That the eighth section of the act approved July 30, 1846, and entitled "An act reducing the duty on imports, and for other purposes," be amended as follows:

SEC. 2. *And be it further enacted*, That it shall be lawful for the owner, consignee, or agent of imports which have been actually purchased or procured otherwise than by purchase, on entry of the same, to make such addition in the entry to the cost or value given in the invoice as, in his opinion, may raise the same to the true market value of such imports in the principal markets of the country whence the importation shall have been made; and to add thereto all costs and charges which, under existing laws, would form part of the true value at the port where the same may be entered, upon which the duties should be assessed. And it shall be the duty of the collector within whose district the same may be imported or entered to cause the dutiable value of such imports to be appraised, estimated, and ascertained, in accordance with the provisions of existing laws; and if the appraised value thereof shall exceed by 10 per cent. or more the value so declared on the entry, then, in addition to the duties imposed by law on the same, there shall be levied collected, and paid, a duty of 20 per cent. *ad valorem* on such appraised value: *Provided, nevertheless*, That under no circumstances shall the duty be assessed upon an amount less than the invoice or entered value, any law of Congress to the contrary notwithstanding.

Approved March 3, 1857.

Tarpauling, a broad piece of canvas well daubed with tar, and used to cover the hatchways of a ship at sea, to prevent the penetration of the rain or sea-water which may at times rush over the decks.

Tartar (Gr. *ταρταρος, infernal;* because it is the sediment or dregs of wine), the substance which concretes upon the inside of wine-casks. It is called red and white *argol*, according to the wine from which it is obtained. When purified it is often called *cream of tartar:* it is a bitartrate of potash.—*See* ARGAL.

Tasman, Abel Jansen. History is silent in regard to the early days of this navigator and geographical discoverer. He was a Hollander by birth, and appointed by the Dutch East India Company to the command of three vessels which they had fitted out at Batavia for the discovery of new countries and a more extended commercial power. Tasman sailed September 5, 1642, and the first-fruits of his enterprise was the discovery of that part of New Holland called Van Diemen's Land, which the navigators made on 24th November. Early in December they set out again, and on the 13th they first saw the Islands of New Zealand, on which the natives successfully opposed his landing. After visiting several islands in the South Sea, some of which were previously unknown, he returned to Batavia, June 15th, 1643, having sailed round the southern hemisphere of the globe. The short-sighted policy of the Dutch East India Company prevented the publication of any account of this voyage, but a map or chart of the discoveries of Tasman was preserved at the Stadt House at Amsterdam, and some years after Dirk Rembranuts published an extract from the journal of this enterprising seaman, of which later geographical writers have been content to avail themselves. In 1856 a proposition was made in England to restore to the whole district hitherto (but unjustly)

known as Van Diemen's Land, the name of *Tasmania*, in meritorious honor of its original discoverer.

Tatta, a town in the territory of Sinde, situated about 60 miles in a direct line from the sea, at a short distance from the western bank of the River Indus, in lat. 24° 44′ N., long. 68° 17′ E. Population uncertain, probably about 8000. The streets are narrow and dirty; but the houses, though built of mud, chopped straw, and timber, are superior to the low huts seen in the adjoining towns and villages. Being situated a little above the part where the Indus divides into the two great branches by which its waters are poured into the Indian Ocean, it might be supposed that Tatta would be a place of great trade. But, owing to the unwholesomeness of the climate, the barbarism of the tribes on its banks, and other causes, its commerce has never corresponded with what might have been anticipated, looking at its position on the map. It had probably attained the acme of its prosperity in the beginning of the 16th century. In 1555 the Portuguese, by way, as they stated, of avenging the treachery of the King of Sinde, inhumanly massacred 8000 of the inhabitants, and burned the town. —*Conquêtes des Portugais*, tome iv. p. 183. It is probable that Tatta never fully recovered from this dreadful blow; but Mr. Hamilton mentions that in the 17th century it was extensive and populous, possessing much commerce, with manufactures of silk, wood, and cabinet ware. The decayed state in which we now find it has been a consequence of the misgovernment and rapacity of its present rulers, the Ameers of Sinde, under whose sway it fell more than 50 years ago. In 1635 the English established a factory at Tatta, in the view of facilitating the disposal of woolens and other goods in the countries traversed by the Indus; and the building occupied by the factory, though far from magnificent, was recently, if it be not still, the best, not in Tatta only, but in the whole country of Sinde. The chief exports are rice, shawls from Cashmere, opium from Malwah, hides, ghee, cotton, goats' wool, carpets, drugs, etc. Putchock, an article largely consumed in China, is a peculiar export of Sinde. The imports comprise a variety of articles, but the quantities are trifling: they consist principally of spices, dye-stuffs, hardware, tin, iron, etc., broadcloths, English cottons, silks, etc. But at present the trade is quite inconsiderable; and no one could believe, *à priori*, that the natural emporium of so great a river as the Indus, traversing many extensive countries, would cut so insignificant a figure in the trading world.

A very well-informed party, Dr. Buist, editor of the *Bombay Times*, has, in his work on the late expedition into Afghanistan, made the following observations on the trade of the Indus:

"The glowing descriptions of Burnes appear to have given a very exaggerated idea of the value of the internal traffic of the countries beyond the Indus. It was forgotten that where there was no industry, no manufactures or mineral wealth, no sea-coast or rivers to permit exportation, there could be little or nothing to give in exchange for imports; and that the wants of a population purely nomade must at all times be simple and singularly few. The whole of our commerce with Persia has never exceeded two millions sterling a year, rarely above one; the total of our trade with Afghanistan certainly never exceeded a million annually, and has very rarely amounted to much more than the half of one. Besides this, the Indus in reality was never closed save by its own dangerous entrances and shallow depth of water. Lord Ellenborough has opened the Indus as far as Mithen Kote; and the Sutlej, in continuation of this, to the Markunda, where it ceases to be navigable for the smallest craft. Yet the gross value of the British goods consumed by the countries adjoining does not at present amount to a quarter of a million sterling, and will not, in all likelihood, be doubled for ten years to come; the expense of maintaining troops between Kurrachee and Bukkur, both stations included, exceeding £600,000 a year; with a less force it would be unwise to think of keeping these stations at all. The great line of traffic was not along but across the Indus, by the Delhi frontier, or parallel to it at a distance of 100 miles, by Sonmeanee and Kelat. The countries beyond the Indus, besides, have always been open to the free admission of every variety of foreign imports on paying a moderate fixed duty. The chief obstruction in reaching these is irremediable by treaty, and arises from the attacks of the plundering tribes in the passes, which can not be restrained save by the payment of a black mail or subsidy."

The delta of the Indus has little in common with the delta of the Nile, except its shape. Not a fourth part of it is cultivated, and its few inhabitants principally lead a pastoral life. It is overgrown with tamarisks and other wild shrubs; and though intersected by the numerous mouths of the river, its surface is dry and arid, being almost destitute of fresh water.

Tax (Welsh *Tasg;* Fr. *Taxe;* Du. *Taxe*), a rate or duty laid by government on the income or property of individuals; an impost, a tribute, or an excise, according to the method of collecting, or the property from which collected. The first taxes levied on the people were by Solon, the first Athenian legislator, 540 B.C. The first class of citizens paid an Attic talent of silver, about £55 sterling. The next was by Darius, the son of Hystaspes, which was a land-tax by assessment, and deemed so odious that his subjects styled him, by way of derision, "Darius the Trader," 480 B.C.—D'Eon's *Historie des Finances*. Taxes in specie were first introduced in England by William I., 1067, and he raised them arbitrarily; yet subsidies in kind, as in wool, corn, and other products of England, continued till the accession of Richard II., 1377.—Haydn.

The following table exhibits the several taxes of all the states of which there are any returns, and shows the aggregate of the taxes of each state, and also of the separate species of tax:

Annual Taxes in the United States, 1850.

Adam Smith lays down four general maxims upon the subject of taxation, which are as follows: "1. The subjects of every state ought to contribute toward the support of the government as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state. 2. The tax which each individual is bound to pay ought to be certain, and not arbitrary. The time of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the contributor, and to every other person. 3. Every tax ought to be levied at the time, or in the manner most likely to be convenient for the contributor to pay it. 4. Every tax ought to be so contrived as both to take out and keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state."

The subject of taxation is ably discussed in the *Edinburgh Review*, xxxiii. xc.; *Democratic Review*, xx.; *Quarterly Review*, xxxv.; *American Quarterly Register*, viii. For further articles, see De Bow's *Review*, xiii.; Hunt's *Merchants' Magazine*, iv.; *Southern Review*, viii.; *North American Review*, xix. (De Ponceau); *Western. Review*, xlvi., xli.

Tea (in one Chinese dialect, *Cha*, in another *Te*; Du. *Te*; Fr. *Thé*; It. *Te*; Russ. *Tchai*; Hind. *Cha*; Malay, *Teh*), the leaves of the tree or shrub (*Thea viridis*, Linn.). The tea-plant ordinarily grows to the height of from three to six feet, and has a general resemblance to the myrtle, as the latter is seen in congenial situations in the southern countries of Europe. It is a polyandrous plant, of the natural order *Columniferæ*, and has a white blossom, with yellow style and anthers, not unlike those of a small dog-rose. The stem is bushy, with numerous branches, and very leafy. The leaves are alternate, on short, thick, channeled footstalks, evergreen, of a longish elliptic form, with a blunt, notched point, and serrated except at the base. These leaves are the valuable part of the plant. The *Camellias*, particularly the *Camellia sasanqua*, of the same natural family as the tea-tree, and very closely resembling it, are the only plants liable to be confounded with it by a careful observer. The leaves of the particular camellia just named are, indeed, often used in some parts of China as a substitute for those of the tea-tree. The effects of tea on the human frame are those of a very mild narcotic; and, like those of many other narcotics taken in small quantities—even of opium itself—they are exhilarating. The green varieties of the plant possess this quality in a higher degree than the black; and a stronger infusion of the former will, in most constitutions, produce considerable excitement and wakefulness. Of all narcotics, however, tea is the least pernicious; if, indeed, it be so in any degree, which we very much doubt.

The tea shrub may be described as a very hardy evergreen, growing readily in the open air, from the equator to the 45th degree of latitude. For the last sixty years it has been reared in this country, without difficulty, in green-houses; and thriving plants of it are to be seen in the gardens of Java, Singapore, Malacca, and Penang; all within six degrees of the equator. The climate most congenial to it, however, seems to be that between the 25th and 23d degrees of latitude, judging from the success of its cultivation in China. For the general purposes of commerce, the growth of good tea is confined to China; and is there restricted to five provinces, or rather parts of provinces; viz., Fokien and Canton, but more particularly the first, for black tea; and Kiang-nan, Kiang-si, and Che-kiang, but chiefly the first of these, for green. The tea districts all lie between the latitudes just mentioned, and the 115th and 122d degrees of east longitude. However, almost every province of China produces more or less tea, but generally of an inferior quality, and for local consumption only; or when of a superior quality, like some of the fine wines of France, losing its flavor when exported. The plant is also extensively cultivated in Japan, Tonquin, and Cochin-China; and in some of the mountainous parts of Ava; the people of which country use it largely as a kind of *pickle preserved in oil!* Botanically considered, the tea-tree is a single species; the green and black, with all the diversities of each, being mere varieties, like the varieties of the grape, produced by difference of climate, soil, locality, age of the crop when taken, and modes of preparation for the market. Considered as an object of agricultural produce, the tea-plant bears a close resemblance to the vine. In the husbandry of China, it may be said to take the same place which the vine occupies in the southern countries of Europe. Like the latter, its growth is chiefly confined to hilly tracts, not suited to the growth of grain. The soils capable of producing the finest kinds are within given districts, limited and partial. Skill and care, both in husbandry and preparation, are quite as necessary to the production of good tea as to that of good wine.

Cultivation.—The best wine is produced only in particular latitudes, as is the best tea; although, perhaps, the latter is not restricted to an equal degree. Only the most civilized nations of Europe and America have as yet succeeded in producing good wines; which is also the case in the East with tea; for the agricultural and manufacturing skill and industry of the Chinese are there unquestionably pre-eminent. These circumstances deserve to be attended to in estimating the difficulties which must be encountered in any attempt to propagate the tea-plant in colonial or other possessions. These difficulties are obviously very great, and perhaps all but insuperable. Most of the attempts hitherto made to raise it in foreign countries were not, indeed, of a sort from which much was to be expected. Within the last few years, however, considerable efforts have been made by the Dutch government of Java to produce tea on the hills of that island; and having the assistance of Chinese cultivators from Fokien, who form a considerable part of the emigrants to Java, a degree of success has attended them, beyond what might have been expected in so warm a climate. The Brazilians have made similar efforts; having also, with the assistance of Chinese laborers, attempted to propagate the tea shrub near Rio de Janeiro; and a small quantity of tolerably good tea has been produced. But owing to the high price of labor, and the quantity required in the cultivation and manipulation of tea, there is no probability, even were the soil suitable to the plant, that its culture can be profitably carried on in that country. It may, perhaps, succeed in Assam, where its culture is now being attempted; for labor is there comparatively cheap, and the hilly and table-lands are said to bear a close resemblance to those of the tea districts of China; but we are not sanguine in our expectations as to the result.

Cultivation of the Tea-plant in the United States.—This plant, which has so long afforded a most grateful beverage to millions of people in every civilized country of the globe, there is much reason to believe, may be successfully cultivated in favorable situations and under proper management, for local consumption, at least, in most, if not all of our Southern States. This was partially realized from an experiment made at Greenville, in the mountainous parts of South Carolina, by the late Junius Smith, in 1848 to 1852. He imported several cases of black and green tea plants, of Chinese stock, of from five to seven years' growth, and planted them in the village above named, where they remained about two years. On their removal to a plantation in that vicinity, in March, 1851, Dr. Smith stated that "they grew remarkably last summer, and are now fully rooted, with fine large main and collateral roots, with an abundance of fibrous radicles. They all stood the snow, eight or nine inches deep upon the level on the 3d of January, and the severe frosts of winter, without the slightest covering or protection,

and without the loss of a single plant. They are now all forming part of the plantation, composed of those received from China last June, and a few planted the first week in June, which germinated the 17th of September. All these young plants were thinly covered with straw. Some of them have lost their foliage; others have not. The stems do not appear to have sustained any injury. The fresh buds are beginning to shoot. I can not help thinking that we have now demonstrated the adaptation of the tea-plant to the soil and climate of this country, and succeeded in its permanent establishment within our borders."

Considering the practical bearing this subject has on the economy and agricultural interests of our Southern States, it is surprising that a single herb, which has proved of such universal acceptance, should retain this position in the world for centuries, and yet still continue to be restricted in its production almost entirely to the country of its origin, although corresponding regions, with respect to latitude, elevation above the sea, and other circumstances which modify the climate, are open to its introduction and culture, and the most intelligent, as well as the most enterprising merchants and others have ever sought to learn every fact connected with its growth and subsequent preparation. Though regarded, in general, as a luxury, and by some even as food, yet it is not an article from which the people of any country should be debarred. On the contrary, it is the policy in this case, as well as in most others, of every government to gratify the wishes of its people, and to facilitate the acquisition of this luxury by its economical importation, or, what would be far more desirable, to extend the production to its own soil. Respecting the expediency of such a measure in this country as that last named, little more need be stated than that most of our citizens will have it, and millions of dollars will annually be paid for its importation. To the argument which has often been advanced, that the very low rate of wages in China is the reason why the production of tea has not been encouraged in this country, it may be stated that, with improved machinery and other appliances, facility of transportation, robust and well-fed laborers, and probably with the aid of the Chinamen now in California, there can be little doubt that we can successfully compete, at least for local consumption, with the primitive utensils, tedious manipulations, and absence of railroads, canals, steam navigation, and even of common roads, of the enfeebled and poorly-fed Asiatics. The cost of the transportation of tea in China, say at a distance, upon an average, from the plantations to Canton, the port of shipment, of 800 to 1000 miles, at a waste of from six weeks' to two months' time, whole cargoes being constantly carried upon the backs of porters, is about four cents a pound, or about one-third of its value at the place of its growth. It is supposable that in no part of the United States, at a corresponding distance from the sea-board, would the cost of carriage be equal to one-fourth of that sum, or occupy one-tenth of the time. Dr. Jameson, superintendent of the tea plantations of the East India Company, on the Himalayan Mountains, in his report of 1847, remarks that the task-work of one laborer is to dress, weed, and keep in order three acres of tea land. In our Middle and Southern States one hand cultivates annually, and keeps in order, six acres of cotton, or fifteen of Indian corn. Therefore, assuming the amount of time for cultivating the respective crops to be equal, the American laborer would perform more than double the amount of work done by the Hindoo, which, undoubtedly, is about the difference in their physical force.

The tea-plant is not only found in China and Japan, chiefly in a cultivated state, but is indigenous in the mountains which separate China from the Burmese territories, especially in Upper Assam, bordering on the province of Yun-nan. It is also cultivated in Nepal, at an elevation of four thousand seven hundred and eighty-four feet above Bengal, in latitude 27° 42′ N.

Before proceeding in the inquiry, it would be desirable to ascertain whether one or several species of the genus *Thea* yield the several varieties of tea, as this might explain some of the discrepancies in the accounts respecting the soil and climate required for its cultivation. Some authors, among whom are Mr. Fortune and Dr. Lettsom, who traveled extensively in China, and had ample opportunities for investigating this subject, consider that all the varieties of tea may be obtained from the same plant, and that the differences are therefore due to the soil or climate, or to the age of the leaf and the mode of preparation. Others, on the contrary, are of the opinion that they are produced from at least two distinct species, *Thea viridis* and *Thea bohea*. There is no doubt, however, that the plants usually known as "Green" and "Black," when cultivated under similar circumstances, retain permanently their characteristics, and that their leaves, respectively, generally resemble those obtained after infusing good specimens of green and black tea. The green-tea-plant, moreover, is much more hardy than the black; one of the former having lived twenty years in the open air, near London, and being only killed in the very severe winter of 1837–'38, when the thermometer fell to 4½° F. Yet, from the great extent of territory over which the tea-plant is found, and from the variety of situations in which it is produced, there can be but little doubt that it is grown in very different soils, though there are, doubtless, certain physical conditions that are best suited to the production of the finest-flavored teas.

The tea-plant loves to grow in valleys, at the foot of mountains, and upon the banks of streams, where it enjoys a southern exposure to the sun, though it endures considerable variations of dryness and moisture, and of heat and cold; for it flourishes in the climate of Pekin, in latitude 40°, as well as about Canton, in 23° 8′ N.; and it is observed that the degree of cold at the former place is nearly as severe in winter as it is in some of our Middle States. The best tea, however, grows in a mild, temperate climate, the country about Nankin producing a better article than either Pekin or Canton. Mr. Bruce, who traveled in Upper Assam in 1836, describes the tea districts as consisting of little mounds or hillocks of earth, on which large trees had grown, their roots alone appearing to save them from being washed away. One thing he observes as worthy of notice, that all the Assam tea grows near water, of which it appears to be very fond, for wherever there is a small stream tea is sure to be found. He subsequently discovered, however, that tea plantations in that country were very extensive, both on the hills and in the plains. But excessive moisture, either in the soil or in the air, is not congenial to the growth of the tea-plant, as it is evident from its preference for sandy or porous soils, or the moulds, in the moist climate of Assam, but which probably would not be requisite where the climate is dry.

Mr. Fortune, who had frequent opportunities to inspect some of the most extensive tea districts of Canton, Yokein, and Chekiang, states that the soil of those of the northern provinces is much richer than it is in Quantung. "Tea shrubs," he says, "will not succeed well unless they have a rich sandy loam to grow in. The continual gathering of their leaves is very detrimental to their health, and, in fact, ultimately kills them. Hence a principal object with the grower is to keep his bushes in as robust health as possible; and this can not be done if the soil be poor. The tea plantations in the north of China are always situated on the lower and most fertile sides of the hills, and never on the low lands. The shrubs are planted in rows, about four feet apart, and about the same distance between each row, and look at a distance like little shrubberies of evergreens. The farms are small,

each consisting of from one to four or five acres; indeed, every farmer has his own little tea garden, the produce of which supplies the wants of his family, and the surplus brings him in a few dollars that are spent on the other necessaries of life." In Japan, tea is planted around the borders of fields, without regard to situation or soil.

Species of Tea.—The tea-plants are raised from nuts, or seeds, usually sown where they are to remain. Three or more are dropped into a hole, and covered with earth four or five inches deep; these come up without any further trouble, and require little culture, except that of removing weeds. The leaves are not collected from the cultivated plants until they are three years old; and, after growing nine or ten years, they are cut down, in order that the young shoots, which will then rise, may afford a greater supply of leaves. The best time to gather the tea is while the leaves are small, young, and juicy. The first gathering usually commences at about the end of February, when the leaves are young and unexpanded; the second about the beginning of April; and the third in June. The first collection, which only consists of fine tender leaves, is most esteemed, and is called by us "Imperial" tea. The second is denominated "Tootsjea," or Chinese tea, because it is infused and imbibed after the Chinese manner. The last gatherings, which are the coarsest and cheapest of all, are drunk by the people of the lowest class. Besides the three kinds of tea named above, it may be observed that, by sorting these, the varieties become still further multiplied. The Chinese, however, know nothing of "Imperial" tea, "Flower" tea, and many other names, which in Europe and America serve to distinguish the quality and the price of the article; but, besides the common tea, they distinguish two other kinds, namely, the "Voui" and "Soumlo," which are reserved for people of the first order of society, and for those who are sick. The principal varieties used in Europe and in this country are the "Green" tea, which is the "Hing," or common tea of the Chinese, and is gathered in April; the "Voui," or "Vou-tche," a delicate kind of "Young Hyson," which differs only from the other in being gathered a few weeks earlier, and consists of the young leaf-buds just as they begin to unfold; and the various descriptions of "Black" tea, which diminish in quality and value as they are collected later in the season, until they reach the lowest kind, called by us "Bohea," and by the Chinese "Ta-cha," or large tea, on account of the maturity and size of the leaves. The early leaf-buds, in spring, being covered with a white, silky down, are gathered to make "Pekoe," a corruption of the Canton word *Pa-ho*, white down. A few days' later growth produces what is sometimes styled "Blackleaved Pekoe." The more fleshy and matured leaves constitute "Souchong;" as they grow still larger and coarser, they form "Congo;" and the last and latest picking of all is the "Bohea." The variety named above, called "Voui," is a scarce and expensive article, and the picking of the leaves in so young a state does considerable injury to the plantations. The summer rains, however, which fall copiously about this season, moisten the earth and air, and, if the plants are young and vigorous, they soon push out fresh leaves.

The process of gathering tea is one of great nicety and importance. Each leaf is plucked separately from the twig; the hands of the gatherer are kept clean; and in collecting some of the finer sorts, it has been stated, upon credible authority, that he is obliged for some weeks previous to abstain from all gross food, lest his breath or perspiration might injure the flavor; to wear fine gloves while at work, and to bathe two or three times a day during this period. In the general harvest seasons, the natives are seen in little family groups on the side of every hill, when the weather is dry, engaged in gathering the tea leaves, which are stripped off rapidly and promiscuously into round baskets, made for the purpose, of split bamboo or rattan. When a sufficient quantity is gathered, it is carried home to the cottage or barn, where the operation of drying is performed. The Chinese dislike gathering the leaves on a rainy day for any description of tea, and never will do so unless necessity requires it. Some even pretend to distinguish the teas made on a rainy day from those made on a sunny day. The process of rolling and drying the leaves, it is stated, can only be learned by actual experience; yet the system adopted to attain this end is as simple as it is efficacious. Let it be borne in mind, however, that the grand object is to expel the moisture, and at the same time to retain as much as possible of the aromatic and other desirable secretions.

As to the differences of flavor and color peculiar to the green and black teas, it is well known that, in many instances, they are produced by art. In describing the green teas grown in the districts of Chekiang, Mr. Fortune remarks that "it must not be supposed that they are the green teas which are exported. The leaf has a much more natural color, and has little or none of what we call the beautiful bloom upon it, which is so much admired in Europe and America. There is now no doubt that all these blooming green teas, which are manufactured at Canton, are dyed with Prussian blue and gypsum, to suit the tastes of the 'foreign barbarians!' Indeed, the process may be seen any day during the season by those who will give themselves the trouble to seek after it. It is very likely that the same ingredients are also used in dyeing the northern green teas for the foreign market." The Chinese, it is asserted, never use these dyed teas themselves; and certainly their taste in this respect is more correct than ours. It is not to be supposed that the dye employed can produce any very bad effects upon the consumer, for, had this been the case, it would have long since been discovered. As to the opinion that green tea owes its verdure to an inflorescence acquired from plates of copper, on which it is supposed to be curled or dried, there is no foundation for the suspicion, as the infusions undergo no change on the addition of volatile alkali, which would detect the minutest portion of copper by turning the liquors blue. And, besides, the drying pans and furnaces used throughout China for this purpose are said to be invariably made of sheet-iron.—*Patent Office Report.*

Adulteration of Tea.—It might have been anticipated, from the high price of and the high duties in some countries on tea, and the facility with which it may be mixed up with foreign substances, that it would not escape adulteration; and the records of the courts of justice show that this is the case, several dealers having been convicted of this pernicious practice. The adulteration is usually effected either by the intermixture of sloe or ash leaves with fresh teas, or by mixing the latter with tea that has been already used. The penalties on such offenses are not specific; and the best, or rather the only, security on which any reliance can be placed, is to be found in the character and respectability of the parties dealing in tea. Even were he influenced by nothing else, it would be extreme folly in any person carrying on an extensive business to engage in such dishonest practices, for they can hardly fail of being detected; and the ruin of his business that would follow such exposure would far more than balance whatever gains he could hope to make by his fraudulent schemes.

Tea Trade in China.—The tea merchants commonly receive advances from the principal merchants and other capitalists of Canton; but, with this exception, are altogether independent of them; nor have the latter any exclusive privilege or claim of pre-emption. They are very numerous; those connected with the green-tea districts alone being about four hundred in number. The black-tea merchants are less numerous, but more wealthy. The greater part of the tea is

brought to Canton by land carriage or inland navigation, but chiefly by the first. It is conveyed by porters; the roads of China, in the southern provinces, not generally admitting of wheel carriages, and beasts of burden being very rare. A small quantity of black tea is brought by sea, but probably smuggled; for this cheaper mode of transportation is discouraged by government, which it deprives of the transit duties levied on inland carriage. The length of land carriage from the principal districts where the green teas are grown to Canton is probably not less than 700 miles; nor that of the black tea, over a mountainous country, less than 200 miles. The tea merchants begin to arrive in Canton about the middle of October, and the busy season continues until the beginning of March; being briskest in November, December, and January. Tea, for the most part, could, previously to the late changes, only be bought from the hong or licensed merchants; but some of these, the least prosperous in their circumstances, were supported by wealthy *outside* merchants, as they are called; and thus the trade was considerably extended. The prices in the Canton market vary from year to year with the crop, the stock on hand, and the external demand, as in any other article and in ar other market. After the season is over, or when the westerly monsoon sets in, during the month of March, and impedes the regular intercourse of foreigners with China, there is a fall in the price of tea, not only arising from this circumstance, but from a certain depreciation in quality, from the age of the tea; which, like most other vegetable productions, is injured by keeping, particularly in a hot and damp climate.

There seems to be little mystery in the selection and purchase of teas; for the business is both safely and effectively accomplished, not only by the supercargoes of the American ships, but frequently by the masters; and it was ascertained by the sales at the East India House, that there was no difference between the qualities of the teas purchased by the commanders and officers of the company's ships, without assistance from the officers of the factory, and those purchased for the company by the latter. An unusual degree of good faith, indeed, appears to be observed on the part of the Chinese merchants with respect to this commodity; for it was proved before the select committee of the House of Commons, in 1830, that it was the regular practice of the hong merchants to receive back, and return good tea for, any chest or parcel upon which any fraud might have have been practiced, which sometimes happens in the conveyance of the teas from Canton on board ship. Such restitution has occasionally been made, even at the distance of one or two years. The company enjoyed no advantage over other purchasers in the Canton market except that which the largest purchaser has in every market, viz., a selection of the teas, on the payment of the same prices as others; and this advantage they enjoyed only as respects the black teas, the Americans being the largest purchasers of green teas.

We herewith subjoin a table for calculating the cost of tea:

COMPARISON OF THE COST OF TEA PER PICUL (133⅓ LBS. AVOIRDUPOIS), WITH THE RATE PER POUND, AND TON OF 9 CWT. OR 1008 POUNDS PER TON.

Per Picul.	Exchange 4s. per Dollar.		Exchange 4s. 3d. per Dol.		Exchange 4s. 4d. per Dol.		Exchange 4s. 5d. per Dol.		Exchange 4s. 6d. per Dol.

Consumption of Tea in Europe.—Of the Continental states, Russia and Holland are the only ones in which the consumption of tea is considerable. In 1818 the imports of tea into Russia amounted to 253,429 poods, or 9,123,444 pounds, in chests, and 116,249 poods in bricks. The former consists almost entirely of the finest varieties of black tea. The consumption of tea in Holland amounts to about 3,000,000 pounds a year, the duty on which varies from 1½*d.* to 4½*d.* per pound. The consumption of France does not exceed 350,000 pounds. The importations into Hamburg vary between 1,500,000 and 2,000,000 pounds, the greater part of which is forwarded to the interior of Germany.

The Tea Trade of the United States.—Tea is the chief article imported from China into the United States. The consumption of the United States amounts to from

30,000,000 to 32,000,000 pounds a year. Duties on tea used to form one of the largest items of American revenue, having in some years produced $3,250,000. Their magnitude, however, was justly complained of; and it is probably owing to this circumstance that, while the consumption of tea was for several years pretty stationary in the United States, that of coffee increased with even greater rapidity than in England. The Secretary of the Treasury of the United States, in his Report for 1827, observed: "The use of tea has become so general throughout the United States, as to rank almost as a necessary of life. When to this we add that there is no rival production at home to be fostered by lessening the amount of its importation, the duty upon it may safely be regarded as too high. Upon some of the varieties of the article it considerably exceeds 100 per cent., and is believed to be generally above the level which a true policy points out. A moderate reduction of the duty will lead to an increased consumption of the article, to an extent that, in all probability, would in the end rather benefit than injure the revenue. Its tendency would be to enlarge our trade and exports to China—a trade of progressive value, as our cottons and other articles of home production (aside from specie) are more and more entering into it. It would cause more of the trade in teas to centre in our ports; the present rate of duty driving our tea ships not unfrequently to seek their markets in Europe, not in the form of reexportation, but in the direct voyage from China. It would also serve to diminish the risk of the United States losing any portion of a trade so valuable, through the policy and regulations of other nations." These judicious suggestions could not fail to command attention; and the flourishing state of the revenue in subsequent years having admitted of a very great reduction of duties, those on tea were wholly repealed. As was to be expected, the consumption has since rapidly increased. The whole imports from China to the United States in 1855 amounted to $11,048,726, of which tea covered $6,806,463. In 1854 the total imports reached $10,506,329, of which tea amounted to $6,545,115; and in 1853, $10,573,710, of which tea covered $8,174,670.

ESTIMATE, IN POUNDS' WEIGHT, OF THE QUANTITIES OF TEA EXPORTED BY SEA FROM CHINA IN 1851-'52, SPECIFYING THE COUNTRIES FOR WHICH THE SAME WERE SHIPPED, AND THE QUANTITY SHIPPED FOR EACH.

Countries.	Pounds.
The United Kingdom	65,160,000
The United States	34,347,000
Australia	8,829,000
Holland	3,000,000
India	500,000
Other places	2,200,000
Total	113,856,000

The exports of tea to Russia by land amount to 14,000,000 or 15,000,000 pounds a year.

The following tables afford a review of the quantities of tea imported into the United States from China since the commencement of that trade, so far as they can be gathered from various official returns:

Years.	Pounds.	Years.	Pounds.
1790	3,047,242	1802	4,209,823
1791	985,997	1803	6,053,529
1792	2,614,008	1804	3,622,898
1793	2,009,509	1805	5,119,441
1794	2,460,914	1806	6,870,806
1795	3,374,118	1807	8,108,774
1796	2,310,259	1808	4,812,638
1797	2,068,399	1809	1,482,690
1798	1,890,965	1810	7,839,457
1799	4,501,503	1811	5,018,118
1800	3,797,624	1812	3,050,089
1801	4,086,960		

Deducting the quantities ascertained to have been exported from the United States during the above period, we find the average annual consumption in the country to have been 3,350,000 pounds for twelve years, from 1801 to 1812, inclusive. From 1813 to 1820, inclusive, the total amount consumed or on hand can alone be given. It approximates very closely, however, the total amount imported during that period, and was as follows: Teas consumed or on hand, 26,717,917 pounds; or an average annual quantity of 3,339,740 pounds. The quantities of teas of all kinds imported into and exported from the United States, from 1821 to 1833, inclusive, together with the quantities retained for consumption, are shown as follows:

Years.	Imported.	Exported.	Consumed.
	Pounds.	Pounds.	Pounds.
1821	4,975,516	531,691	4,443,955
1822	6,689,434	1,338,846	5,305,588
1823	8,210,010	1,735,076	6,474,924
1824	8,934,487	1,148,868	7,785,619
1825	10,999,548	2,095,809	8,178,740
1826	10,009,900	1,908,672	8,100,228
1827	5,875,638	1,625,417	4,249,221
1828	7,707,427	1,417,846	6,289,581
1829	6,636,790	1,018,243	5,618,447
1830	8,609,415	1,736,324	6,873,091
1831	5,182,867	526,180	4 656,681
1832	9,906,606	1,279,262	8,627,344
1833	14 639,822	1,712,772	12,927,043

If from the imports are deducted the exports for each year, an average annual consumption, for the entire period, of 7,000,000 pounds will be given. The following statement shows the imports and exports of tea, the quantity remaining on hand or consumed each year, from 1834 to 1841, exclusive of 601,319 pounds imported during the entire period from other countries than China:

Years.	Imported.	Exported.	Consumed.
	Pounds.	Pounds.	Pounds.
1834	16,282,977	3,081,308	13,201,669
1835	14,415,572	2,082,866	12,332,706
1836	16,382,114	1,876,342	14,485,772
1837	16,082,884	2,508 286	14,475,598
1838	14,418,112	2,435,302	11,982,810
1839	9,549,817	1,592,033	7,757,784
1840	20,006,545	3,123,406	16,883,069
1841	11,560,301	660,832	10,899,469
Total	119,397,872	17,380,565	102,017,307

The preceding table will show that the average annual amount consumed, or retained on hand, during this period, was 12,752,163 pounds. The following statement exhibits the values of all imports from China into the United States from 1833 to 1841, inclusive, distinguishing the values of teas; together with the number of vessels and the tonnage employed in the trade:

Years.	Number of Vessels.	Tonnage.	Values of Imports.	Values of Teas.
1833	41	15,334	$7,511,570	$5,484,606
1834	43	15,551	7,892,927	6,217,949
1835	36	13,495	5,987,187	4 572,806
1836	43	16,418	7,324,816	5,342,811
1837	43	16,160	8,965,337	5,103,054
1838	29	11,821	4,764,536	3,317,156
1839	18	7,392	3,678,500	2,428,419
1840	35	14,774	6,040 829	5,427,010
1841	28	11,486	3,695,388	3,466,245
Total	315	122,954	$66,460,499	$42,290,053

From the preceding table it may be seen that the value of teas reached annually, during the period designated, about $4,698,894, and constituted 75 per cent. of the value of the entire imports; while the trade employed annually about thirty-five vessels, averaging 390 tons each. The preceding table is continued as follows, down to 1855, and exhibits generally the same proportion between the value of total imports from China into the United States and the value of teas:

Years.	Tonnage.	Values of Imports.	Values of Teas.
1842	12,488	$4,134,615	$4,367,101
1843	13,460	4,585,506	3,776,461
1844	15,399	4 931,225	4,075,191
1845	21,682	7,285,914	5,730,101
1846	19,245	6,573,881	5,022,600
1847	17,775	5,583,343	4,278,448
1848	24,383	8 083,406	6,217,111
1849	19,418	5 513,785	4,071,139
1850	22,414	6,503,462	4,585,720
1851	38,914	7,095,144	4,633,529
1852	78,085	10,509,250	7,144,500
1853	92,864	10,537,710	8,174,670
1854	70,426	10,506,329	6,545,115
1855	70,815	11,048,726	6,806,463

TEA EXPORTED FROM CHINA TO GREAT BRITAIN AND THE UNITED STATES, RESPECTIVELY, FOR A PERIOD OF TEN YEARS, ENDING JUNE 30, 1854.—(MADE UP FROM THE "CHINA MAIL.")

Years.	To Great Britain.	To United States.
	Pounds.	Pounds.
1845	53,570,200	20,762,558
1846	57,584,600	18,502,288
1847	53,365,000	18,171,625
1848	47,094,300	19,338,640
1849	47,242,700	18,672,300
1850	53,961,800	21,757,800
1851	64,020,100	28,760,800
1852	65,137,200	34,354,000
1853	72,906,100	40,074,500
1854	77,217,900	27,867,500

It will be noticed that these statistics agree with those given below, the latter being taken from the United States Treasury Reports.

TEA EXPORTED FROM CHINA TO GREAT BRITAIN, FRANCE, AND THE UNITED STATES, FROM 1821 TO 1840.—(FROM FRENCH AUTHORITIES.)

Years.	England.	France.	United States.	Total.
	Kilograms.	Kilograms.	Kilograms.	Kilograms.
1821	13,320,000	50,000	2,223,000	16,114,000
1822	12,315,000	14,000	2,987,000	15,316,000
1823	13,072,000	15,000	3,694,000	16,781,000
1824	14,802,000	6,000	4,010,000	18,318,000
1825	13,206,000	3,000	4,581,000	17,790,000
1826	13,428,000	151,000	4,533,000	18,112,000
1827	17,886,000	276,000	2,641,000	20,803,000
1828	14,706,000	....	3,460,000	18,166,000
1829	13,745,000	121,000	2,968,000	16,834,000
1830	14,854,000	9,000	3,863,000	18,226,000
1831	14,242,000	237,000	2,330,000	16,809,000
1832	14,260,000	47,000	4,452,000	18,758,000
1833	14,427,000	386,000	6,587,000	21,400,000
1834	14,413,000	648,000	7,319,000	22,380,000
1835	18,725,000	46,000	6,492,000	25,253,000
1836	21,800,000	116,000	7,341,000	29,277,000
1837	16,426,000	35,000	7,608,000	24,069,000
1838	19,187,000	124,000	6,485,000	24,796,000
1839	17,179,000	93,000	4,184,000	21,449,000
1840	12,610,000	264,000	9,063,000	21,937,000

In addition to the foregoing, large quantities of tea are exported from China to the Netherlands, Hanse Towns, the Levant, the Mediterrancan, and Russia. To the last-named country there were exported in 1839, 3,442,000 kilograms; and in 1840, 3,585,000 kilograms; which, added to the totals for 1839, will give for that year 24,891,000 kilograms; and for 1840, 25,522,000 kilograms.

"In the consumption of tea, the United States rank next to Great Britain. From 1815 to 1834 there were exported to the former, for consumption and re-exportation, 35,805,000 kilograms. In 1832, 4,023,000 kilograms, of which 20,000 kilograms were re-exported. In 1833-'34 the Americans exported from Canton for Europe 1,014,000 kilograms. Consumption in the United States has largely increased since tea was put on the free list of that country."

The following is a statement of the exports of tea from China to the United States for ten years, from 1845 to 1854, inclusive:

Year ending June 30.	Green.	Black.	Total.
	Pounds.	Pounds.	Pounds.
1845	13,812,099	6,950,459	20,762,558
1846, in 40 vessels	14,230,082	4,216,168	18,502,248
1847, in 37 "	13,853,132	4,318,496	18,171,628
1848, in 38 "	15,346,030	3,992,617	19,338,647
1849, in 37 "	13,818,700	4,853,600	18,672,300
1850, in 44 "	14,396,400	7,361,400	21,757,800
1851, in 64 "	15,205,700	13,315,100	28,760,800
1852, in 68 "	20,937,300	13,396,700	34,334,000
1853, in 72 "	26,489,800	14,484,700	40,074,500
1854, in 47 "	18,230,300	9,397,200	27,867,500

For the year ending June 30, 1855, the total number of pounds exported to the United States was 31,515,900, in forty-eight vessels, distributed among three ports, as follows:

	Pounds.
Canton	2,561,900
Foo-chow	5,500,800
Shanghai	23,553,200
Total, year 1854-'55	31,515,900

For the year ending June 30, 1856, it was 40,247,800 pounds, in fifty-eight vessels, distributed as follows:

	Pounds.
Canton	8,246,800
Foo-chow	10,878,900
Shanghai	21,121,100
Total, year 1855-'56	40,247,800

From July 1, 1856, to January 15, 1857, the exports to this country were 16,299,600 pounds.

	Pounds.
From Canton	997,500
From Foo-chow	5,857,200
From Shanghai	9,444,900
Total, 6½ months	16,299,600

The exports to Great Britain during the year 1855-'56 were 91,931,800 pounds; and from July 1, 1856, to January 15, 1857, 39,991,400 pounds.

IMPORTS OF TEA, THE GROWTH OF THE COUNTRIES EXPORTING IT, INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.—(FREE OF DUTY.)

Whence imported.	Pounds.	Value.
Dutch East Indies	21,193	$3,864
British East Indies	798,436	135,120
Philippine Islands	630	174
China	19,505,282	5,618,702
Total	20,325,541	$5,757,360

In England there are certain ports where teas may be imported. There are warehouses which may be approved of for the deposit of teas, and are to be exclusively appropriated to that purpose. No package shall be divided into smaller packages, except for the purpose of stores, nor shall the mixing of tea of any sort or sorts be permitted in the warehouses, either for home consumption or exportation. The packages shall be sorted and arranged in the warehouse by the occupier, according to their respective "chops" or "beds," so as to enable the officers to select from each the required number of packages for taring, and to ascertain the proper tare to be allowed on the package therein.

EXPORTS OF TEA, THE GROWTH OF FOREIGN COUNTRIES, FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Duty on Teas.—Tea or coffee, shipped from the country of production, but not for a distinct and specific destination to persons or places in the United States, and transhipped at a foreign intermediate port for the United States, is, on importation, liable to a duty of 20 per cent. But if originally shipped in national vessels, or vessels placed on that footing by treaty, for a specific party and place in the United States, from the country of production, and so imported into the United States, these articles are entitled to free entry, although a mere transhipment may have taken place at a foreign intermediate port.

Tea or coffee, entitled to free entry when originally imported into the United States, afterward exported to a foreign port and brought back as part of the returning cargo of the exporting vessel, not having been landed abroad, is entitled to free entry on its reimportation under these circumstances. Tea and coffee, when imported direct from the place of their growth or production in American vessels, or in foreign vessels so entitled by reciprocal treaties, are exempt from duty.

Coffee, the product of a possession of the Netherlands, imported into the United States in a vessel of the Netherlands direct from such possessions, or from the Netherlands, is admitted free of duty under the tariff law of 1846, and the first article of the treaty between the United States and the Netherlands of August 26, 1852. Tea or coffee imported direct from the place of its production, in vessels of the kingdom of Prussia, and of the Hanseatic republics of Hamburg, Bremen, and Lübeck, is placed on the same footing with that imported in American or Dutch vessels.

Tea or coffee, the production of China, imported *via* Singapore, is admitted to free entry, if it be satisfactorily shown at the time of entry that it was laden on board the American importing vessel from Chinese boats or junks in Chinese waters, intended in good faith to be conveyed therein direct to a specified port of the United States, as its ultimate destination.

Teak Wood, or **Indian Oak**, the produce of the *Tectona grandis*, a large forest tree that grows in dry and elevated districts in the south of India, the Burman empire, Pegu, Ava, Siam, Java, etc. Teak timber is by far the best in the East; it works easily, and, though porous, is strong and durable; it is easily seasoned, and shrinks very little; it is of an oily nature, and therefore does not injure iron. Mr. Crawfurd says that in comparing teak and oak together, the useful qualities of the former will be found to preponderate. "It is equally strong, and somewhat more buoyant. Its durability is more uniform and decided; and to insure that durability it demands less care and preparation; for it may be put in use almost green from the forest, without danger of dry or wet rot. It is fit to endure all climates and alternations of climate."—*See* TREDGOLD'S *Principles of Carpentry;* CRAWFURD'S *Eastern Archipelago;* REES' *Cyclopædia.* The teak of Malabar, produced on the high table-land of the south of India, is deemed the best of any. It is the closest in its fibre, and contains the largest quantity of oil, being at once the heaviest and the most durable. This species of teak is used for the keel, timbers, and such parts of a ship as are under water: owing to its great weight, it is less suitable for the upper works, and is not at all fit for spars. The teak of Java ranks next to that of Malabar, and is especially suitable for planking. The Rangoon or Burman teak, and that of Siam, is not so close-grained or durable as the others. It is, however, the most buoyant, and is therefore best fitted for masts and spars. Malabar teak is extensively used in the building-yards of Bombay. Ships built wholly of it are almost indestructible by ordinary wear and tear, and instances are not rare of their having lasted from 80 to 100 years. They are said to sail indifferently, but this is probably owing as much to some defect in their construction as to the weight of the timber. Calcutta ships are never wholly built of teak; the timbers and frame-work are always of live wood, and the planking and deck only of teak. The teak of Burma, being conveyed with comparatively little difficulty to the ports of Rangoon and Maulmain, is the cheapest and most abundant of any; and it is mainly owing to the facility with which supplies of it are obtained that ship-building is now carried on so very extensively at Maulmain. It is largely exported to Calcutta and Madras.—*See* RANGOON. A species of timber called African teak is exported from the west coast of Africa; but in point of fact it is not teak, and it is destitute of several of its most valuable properties. It is, however, for some purposes, a useful species of timber.

Teasel, or **Fullers' Thistle** (Ger. *Weberdistel, Kratzdistel;* Fr. *Chardon à carder;* It. *Cardo da cardare;* Sp. *Cardencha, Cardo peinador*). This plant, which is cultivated in the north and west of England, is an article of considerable importance to clothiers, who employ the crooked awns of the heads for raising the nap on woolen cloths. For this purpose they are fixed round the periphery of a large, broad wheel, against which the cloth is held while the machine is turned. In choosing teasels, the preference should be given to those with the largest bur, and most pointed, which are generally called *male teasels.* They are mostly used in preparing and dressing stockings and coverlets; the smaller kind, commonly called the fullers' or drapers', and sometimes the *female teasels,* are used in the preparation of the finer stuffs, as cloths, rateens, etc.

Tehuantepec, Gulf of, a bay of the Pacific Ocean, Central America, bounded northwest by the state of Oaxaca, and northeast by the republic of Guatemala, lat. 16° N., long. 94° to 95° W. It receives the River Tehuantepec 10 miles south of the town.

The Isthmus of Tehuantepec, states of Oaxaca, Vera Cruz, and Tabasco, is the narrowest part of the land

separating the Gulf of Mexico from the Pacific, and is 130 miles across. It produces mahogany, fustic, logwood, cotton, drugs, cacao, indigo, gum, salt, with various kinds of grain; and its uplands abound with fine pastures. It is traversed almost throughout by the River Coatzacoalcos. This is one of the places where it has been proposed to unite the Atlantic and Pacific oceans by a canal, of which the river and some lakes would form a part.

This new inter-oceanic route is by the River Coatzacoalcos to Suchil, something over 100 miles from the sea, all the windings included, thence overland by stage to Ventosa, 130 to 140 miles; making in all about 240 miles from the Atlantic to the Pacific, to be accomplished in a day and a half from the sea. This distance will be materially diminished—the time still more so—on completion of a projected railroad from Minatitlan to Suchil, already surveyed.

From the mouth of the river to Minatitlan, twenty miles, the channel is excellent, capacious enough for the largest ocean steamships. The depth of water on the bar at low tide is 15 to 16 feet (Major Barnard says 13), and only one obstruction, a large rock, has been discovered, and that easily avoidable. From Minatitlan to Suchil the river becomes more difficult, and must be traversed by steamboats; those contemplated are, in size and fashion, not dissimilar from the Cumberland River boats. The *Leonora*, built in New York, and placed on this portion of the river a short time since, had proved of too large draught. The current is about two miles and a half an hour—from Suchil to Minatitlan, thirty-six hours. These are the termini of the projected railway, by which, when completed, a distance of 45 miles will be saved.

From Suchil to Ventosa, on the Pacific, 130 to 140 miles, the route is by the newly-made stage-road over a rough, sometimes mountainous country. The heaviest work has been on this end of the road, where also the River Puerta, fordable at times, but high and marshy in the rainy season, is to be spanned by a bridge a mile and a half in length. Some compensation is made on the other side of the mountain, however, by an old road, which has proved available from Chivela Pass to the Pacific plain. The time contracted for on the stage-road is five miles per hour—twenty-six to twenty-eight hours; between Minatitlan and Suchil the passage by steamboat will be from six to eight hours, in all about thirty-five hours, or a day and a half from ocean to ocean. The harbor of Ventosa is good, but a breakwater will be necessary. As to the probable amount of travel and business on the Tehuantepec road, when in full operation, we have no further information than is already, in various speculations, before the public. The shortest route from England, New York, and New Orleans, to the ports of the Pacific, the most flattering expectations are of course entertained respecting it.

The present population of the territory of Tehuantepec is estimated at 50,000, descendants, for the most part, of the original Aztecs. They are gregarious in their habits, living in communities numbering 3000 to 4000 each, and distant from each other five to ten miles. They are industrious, kind-hearted, and docile, but very thriftless. The government is, of course, that which at any time our *mobile* Mexican neighbors may chance to have. In general, the rights and privileges of the old Spanish colonial towns are fully enjoyed. Titles to landed property are good, and always respected. The town of Minatitlan, the capital and emporium of the territory, has at present a population of about five hundred. The commerce in the native products of the country, mahogany, dyewoods, coffee, etc., is large and increasing. The last quarter Mr. P. cleared twelve American vessels, averaging 200 tons each, and the foreign export business was about the same. The government, a short time since, appropriated the handsome sum of $50,000 for the erection of a new custom-house, the foundation of which is already laid. On the whole, what with present business and future expectations, our Tehuantepec neighbors are evidently looking up.—*United States Consul at Minatitlan.*

Tehuantepec Route.—The following figures show the distances on the Tehuantepec route from New York to San Francisco:

	Miles.
From New York to the mouth of the Coatzacoalcos	2275
Transit distance	236
Ventosa to San Francisco	2304
Total	4815

Telegraph. Long before the electric telegraph had been imagined, the art of rapidly conveying intelligence from point to point had occupied the attention of mankind, and various expedients for the accomplishment of this object had been devised. The most primitive modes of telegraphing were by means of signal-fires, torches, trumpets. More recently, since the invention of gunpowder, the cannon and sky-rockets have been used. On the invention of the aerial telegraph, or semaphore, these means were abandoned.

In the year 1684 Dr. Hooke described a plan for an aerial telegraph, and about 1704 M. Amontons instituted experiments with the same end in view. However, neither of these plans were carried into effect; and it was not until 1794 that the semaphore was actually used. In that year an aerial telegraph, the invention of M. Claude Chappé, was employed for the transmission of intelligence between Paris and Lille; the conveyance of a signal from one of these places to the other occupying only two minutes. Semaphores, mostly modifications of the plan of Chappé, were soon in use throughout Europe—in England, in 1795; Denmark, in 1802; India, in 1823; Prussia and Austria, about 1833; and Russia, in 1839.

This method of telegraphing is still in use, but is rapidly being superseded by the electric telegraph. In 1852 the only aerial telegraph line in England was between Liverpool and Holyhead. This has now, we believe, been superseded by the establishment of electric communication between those two places.

The cost of working the aerial telegraph was enormous. The line above mentioned cost in the vicinity of £1500 (about $7500) per annum; and a similar line, between London and Portsmouth, cost £8300 (about $16,500) per annum.

These telegraphs were necessarily imperfect; being limited in their power of conveying intelligence, exceedingly slow, and liable to total interruption by storms of rain and snow, fogs and darkness.

The idea of the employment of electricity as a means of conveying intelligence to a distance appears to have been long entertained, and experiments to ascertain the practicability of electrical communication between distant places were early made by scientific men throughout the civilized world. In 1729 Grey and Wheeler discovered that a current of electricity could be made to flow through considerable lengths of wire. In 1746 Winckler at Leipsic, and Le Monnier at Paris, experimented on the same subject of the transmission of the electric current through conducting bodies. In 1747 Dr. Watson, in England, repeated and extended these experiments, sending a current through two miles of wire and two of earth; sending shocks across the Thames and the New River. Dr. Franklin in 1748, and De Luc in 1749, repeated many of these experiments. In addition, experiments bearing more or less on the subject of electric telegraphy were made by Lesage in 1774, Reusser in 1794, Cavallo in 1795, Betancourt in 1798, Sömmering in 1807, and Prof. Oersted in 1819.

The first electric telegraph actually applied seems to have been the invention of M. D. F. Salva. Humboldt says his telegraph was established between Madrid and Aranjuez in 1798—a distance of about 26 miles.

In 1816 Francis Ronalds, of Hammersmith, England, constructed a telegraph of eight miles in length. This

telegraph was one of the best that had then been invented, and was capable of transmitting intelligence with considerable rapidity. In 1828 he urged the importance of his invention for government purposes, writing to Lord Melville on the subject, but without effect.

In 1827 Harrison G. Dyer, an American, constructed a telegraph on Long Island, using frictional electricity. The line was about two miles in length.

Previous to 1809 no mode of electric telegraphing capable of any extended use had been discovered. The principal cause of failure seems to have been in the employment of frictional electricity, which is, on account of its high intensity, confined with great difficulty to conducting bodies, rapid and incontinuous in its action, and, from its small quantity, devoid of energetic force.

Sömmering made a step forward by his application of galvanism to the purposes of telegraphing. In 1809 he constructed, at Munich, a telegraphic apparatus, using 35 wires. The signals were made by the decomposition of water in 35 tubes, which were in connection with the 35 wires of the line. Telegraphs employing the pure galvanic force were also invented by Schweigger, De Haer, R. Smith (Scotland, about 1843); Bain, 1846; and Morse, 1849.

Bain's was the only telegraph on this principle that was extensively used. He used a very simple apparatus, receiving the galvanic current upon chemically-prepared paper, where it made a light-blue mark. A combination of dots constituted his alphabet. This telegraph was exceedingly rapid, being capable of transmitting 1200 letters per minute. In 1850 about 200 miles of telegraph in England, and 1500 in America, were worked under Bain's patents. His plan has gone now almost entirely out of use, other and better instruments superseding it.

The property which lightning possesses of reversing or destroying the poles of the natural magnet, and of imparting magnetism to iron, had long been known; but not until 1820 was the fact turned to any useful purpose. Professor Oersted, of Copenhagen, discovered, during 1819, that if a wire charged with electricity is placed parallel to a magnetic needle, the needle will deviate from its natural position, tending to assume a position at right angles with the conducting wire; and that this deviation follows a regular law. Proceeding on the groundwork of Professor Oersted, many other discoveries were made by Arago, Ampère, Faraday, Davy, Sturgeon, and Professor Henry.

Arago and Ampère in France, and Sir H. Davy in England, discovered that a current of electricity would render steel magnetic; and Ampère found that by coiling the wire in the form of a helix round steel the effect was greatly increased. William Sturgeon, of London, in the year 1825, discovered and constructed the electro-magnet. The electro-magnet is one of the most valuable parts of the electric telegraph now in use, and has entered more or less into nearly every telegraph invented since its discovery.

Oersted's great discovery gave a new direction to the science of electric telegraphing. Galvanic telegraphs were, in turn, discarded, and magneto-electric telegraphs took their place.

Ampère was the first to make use of Oersted's discovery in telegraphing. In 1820 he invented a telegraph, using 36 magnetic needles. His plan was not practically carried into effect.

Baron de Schilling invented a needle telegraph in 1832, at St. Petersburg. His instrument had five needles, which, by their vibrations to the right or left, indicated signals. He afterward improved his instrument, using but one needle.

In 1837 Dr. Steinheil had a telegraphic instrument working a distance of 12 miles. His telegraph of one wire, and either one or two magnetic needles, as might be desired, made permanent marks on paper, and also telegraphed by sound. When writing, his needles were furnished with ink-tubes, and by their motions marks were recorded on paper; when telegraphing by sound, the needles were made to strike bells of different tones. He used the earth as part of the circuit. This was very nearly a perfect instrument, and is infinitely superior to the majority of telegraphic instruments since invented.

June 12, 1837, Messrs. Cooke & Wheatstone, in England, obtained a patent for "Improvements in giving signals and sounding alarms in distant places, by means of electric currents transmitted through metallic circuits." This seems to have been the first telegraph that was patented in Europe. Cooke & Wheatstone's first telegraph was a needle telegraph. They used five magnetic needles and five wires. An electro-magnet was used to sound an alarm. A second patent, taken out by Cooke only, was issued in April, 1838. These instruments were found to be very imperfect, and after a short trial were abandoned.

A different form of telegraph, the invention of the same parties, having but two needles, has, until very recently, been in general use in England; but the Morse system is now being adopted there and upon the Continent.

The last patent taken out by Cooke & Wheatstone is dated May 6, 1845. During the same year an act of Parliament was obtained incorporating "The Electric Telegraph Company," working these patents.

The needle telegraph is, comparatively, very slow; the average speed per message being but 14 words per minute. It is, however, yet extensively used in England. Cooke & Wheatstone took out a patent in America, but their instrument was never practically used in the United States.

Since Cooke & Wheatstone's first patent, upward of 40 patents have been taken out in England alone. Very few of the instruments since invented are in practical operation.

Morse's Telegraph.—In the year 1832 Professor S. F. B. Morse first conceived the idea of an electric telegraph; and in the year 1835 he had a telegraph constructed, the basis of his present simple and beautiful instrument. In September, 1837, he exhibited his instrument at the New York University, working through 1700 feet of wire.

Morse applied for a patent in the United States in April, 1838. This application was afterward withdrawn, and his patent was not taken out until June, 1840. In 1842 he petitioned Congress, who appropriated $30,000 to his use for the construction of a line between Washington and Baltimore. In June, 1844, Morse had his invention in successful operation between Washington and Baltimore—a distance of 40 miles. This was the only line in the United States constructed under government patronage.

The Morse Electro-magnetic Telegraph consists mainly of two parts—the receiving magnet and the registering apparatus. The receiving magnet is surrounded by fine wire, and is of the horseshoe form. An adjustable armature is placed before the poles of the receiving magnet. The main circuit passes unbroken through the receiving magnet to the next station.

The registering apparatus has a powerful horse-shoe magnet placed vertically. Above the poles of the magnet is an armature attached to one end of a movable lever, on the other end of which is a steel style for the purpose of impressing marks on paper placed immediately above the style. Intelligence is transmitted by means of breaking and closing the main circuit. For this purpose a small key is employed. When this key is pressed down, the current passes to the receiving magnet of the distant station, causing the receiving magnet to close the local circuit. On the local circuit being closed, the registering magnet becomes excited and attracts the armature downward, causing a mark on the paper, placed above the lever of

the armature. On the circuit being opened again by the operator's raising the key, all returns to its usual quiescent position. This operation is performed at every closing and breaking of the circuit. By keeping the key depressed for an instant, a dot is made; if it is depressed for a longer time, a line. A combination of dots and lines forms the telegraphic alphabet used with this system. The speed of this instrument is, in the hands of an expert, about twenty words per minute.

Professor Morse's instrument was for some time the only instrument in use in this country, and is now used to a greater extent than all other telegraphs combined.

The House Telegraph, the invention of Royal E. House, differs materially from all previously invented telegraphic instruments, printing messages in the ordinary Roman letters. Directly under a set of keys like those of the piano-forte is a shaft inclosed by a cylinder. This shaft is made to revolve rapidly by means of a treadle. The shaft and cylinder are so arranged that the cylinder can be arrested while the shaft still revolves. On one end of this cylinder is a brass wheel having fourteen teeth. A spring is so arranged, that when the shaft and cylinder revolve it will alternately strike a tooth of this brass wheel and pass into an open space; thus alternately breaking and closing the electric circuit. On the cylinder two lines of teeth project, fourteen in each line, one for each tooth and each space of the circuit wheel. These teeth are immediately below the keys, so that by pressing down a key the motion of the cylinder is stopped. By making the cylinder revolve, the circuit is rapidly broken and closed, which continues till a key is depressed. On the key being released, the revolution goes on as before. The electrical pulsations produced by the breaking and closing of the circuit are conveyed to the magnet of the distant instrument, each pulsation causing the magnet to act.

The type-wheel, a wheel having the letters of the alphabet cut upon it, is made to revolve, but is so checked by an escapement wheel that only one letter goes forward at a time. This escapement is connected by a lever with the piston of an air-chamber. This piston is caused to move horizontally backward and forward, by means of compressed air admitted alternately on different sides of the piston. A valve attached to the magnet regulates the pressure of the air on the piston. Every breaking and closing of the circuit causes the magnet, piston, and escape to act, so that for every time the circuit is broken or closed the type-wheel is advanced one letter. If any letter of the type-wheel is placed in a certain position, and the key corresponding to it is depressed, raised, and again depressed, the circuit wheel at the transmitting station and the type-wheel at the receiving station make one revolution, bringing the letter back to its former position. Any other letter is brought into the required position by pressing down its key on the keyboard of the instrument. The letter first brought into position is the dash. The type-wheel is stopped at the dash, after which the printing goes regularly on as the keys are depressed. Immediately before the type-wheel is the press, containing a narrow strip of paper. At the depression of a key the type-wheel stops, sets a crank in motion, which presses the paper forcibly against the letter opposite to it on the type-wheel. On the key being raised, the type-wheel revolves until the depression of another key, which again unlocks the press and prints a letter.

The electric current is used in this instrument to preserve equal time, that the letters in one machine may correspond to those in the other. The number of pulsations required to indicate a succession of letters is exceedingly unequal; from *a* to *b* requires one, from A to A twenty-eight pulsations.

House obtained a second patent in December, 1852. The House instrument is used to a limited extent in this country. It is still less used in England, where it is known as Jacob Brett's Telegraph. This instrument is more rapid than Morse's, printing accurately from twenty-five to thirty words per minute.

The Hughes Telegraph is the invention of David E. Hughes, of Kentucky, who obtained a patent in 1855 and in 1858. This, like the House Telegraph, is a printing telegraph, but in principle and in mechanism it is totally unlike that instrument.

The Hughes system of telegraphing combines not only all the advantages of all other existing systems, but reduces the labor which electricity has to perform to the lowest possible point. In all other systems it requires several distinct electrical impulses to form a single letter. In the House system, which is based upon the number of waves sent, the average number of impulses required to determine the intended letter is seven: in the Morse system, which is based upon the number and duration of the waves sent, the average is three and a half. To print a letter every closing or breaking of the circuit, so that every electrical impulse should determine a letter, has long been a desideratum, more particularly since the discovery that it requires an appreciable time to charge a long wire with electricity; so that on long circuits we should be obliged to send a less number of electrical waves in a given time than on a short circuit. On submerged cables this and other effects are still more marked, reducing the speed of transmission upward of two-thirds. If every wave, instead of every three waves, produced a letter, it is evident enough that the speed of transmission through the cable would be equal to that of the air-lines with the systems now in use, and that the speed of the air-lines would be increased two-thirds. The Hughes system uses but one electrical impulse per letter, and by the use of a new and exceedingly sensitive magnet can work on lines of far greater length, and with a rapidity exceeding that of any telegraph now in existence.

To carry out the one-wave system, it is essential that the type-wheels of the different instruments should revolve at precisely the same speed, so that the same letter on each type-wheel should be opposite a given point at the same time. Clock-work governed by means of a pendulum would be too slow for any practical use. Instead of a pendulum, Hughes employs as a governor a vibrating spring. This spring allows the type-wheels to revolve with any desired degree of rapidity. This governor is dependent for its correct action on a law of acoustics, viz., "that a certain number of vibrations per second produces a certain musical tone; and if there are two or more springs of the same tone, they invariably give the same number of vibrations per second." If these springs by their vibrations are made to unlock an escapement, it follows that all instruments governed by springs of the same tone must revolve in exactly the same time. The type-wheels, thus governed, revolve at the rate of 100 revolutions per minute, and the average number of letters sent at each revolution being two, it follows that the speed of the instrument is 200 letters per minute, equal to about forty words.

This is about the speed that an ordinary operator touches the keys, but not by any means the utmost speed of the instrument, as the type-wheels would revolve with undeviating accuracy at a speed of 500 instead of 100 revolutions per minute.

The magnet of the Hughes instrument, which receives the electric current from the distant station, is a combination of a natural and an electro-magnet. The attractive power of the natural magnet, exerted through the electro-magnet, holds a small armature in contact with the poles of the electro-magnet. A spring attached to the armature is so adjusted as nearly to pull the armature away from the poles of the electro-magnet. The slightest change in polarity causes the spring to pull the armature away from its resting-

place. The armature is restored to its place by means of a lever, which acts upon it at the instant it is pulled away from the electro-magnet's poles. This arrangement employs the current of electricity merely to effect a slight change in the force by which the armature is held to the magnet's poles, and it is so remarkably sensitive that the mere contact of a piece of zinc against a copper wire has been found amply sufficient to work the magnet. From its sensitiveness it requires scarcely a tenth of the battery-power used by the most sensitive of other systems.

Another wonderful and beautiful feature of this instrument is its power of writing both ways, sending and receiving messages at the same instant over one wire. This instrument thus doubles the capacity of the wire, making it do the service of two; transmitting with certainty and accuracy 200 letters each way per minute, an actual transmission of 400 letters, or 80 words, per minute. This result is accomplished by means of a peculiar arrangement of the batteries and magnets, so that the current from the transmitting station does not influence its own magnet, while it affects that of the receiving station, each magnet thus being placed under control of the distant operator.

The machinery which accomplishes results so astonishing is simple in the extreme. It consists mainly of four clock-wheels used to turn the type-wheel. These wheels are governed by the vibrating spring before explained. At the moment a current from the distant station enters the magnet the armature flies off, opens a detent which causes a small press to be locked to the wheel-work of the instrument, and then to press a strip of paper against the letter of the type-wheel opposite the press at that instant. A current is sent upon the line by means of keys arranged like those of a piano, and having the letters of the alphabet engraved upon them. At the moment one of these keys is depressed the magnet of the receiving station is made to act, and the press to print the letter corresponding to the touched key. The receiving operator has nothing to do but to tear off the messages as they arrive.

This instrument, after more than ten years of persevering thought and labor, is at last perfected, and now fulfills all the requisites of a perfect telegraph instrument—more than realizing all that has ever been claimed for it by the inventor. The remarkable ingenuity, talent, and knowledge of the principles of electrical science displayed by Professor Hughes, in the invention of his beautiful machine, deservedly place him foremost in the ranks of the laborers in this branch of art, and justify his claim of having invented a telegraph instrument which, for speed, neatness, and economy, is without a rival.

The numerous advantages that the Hughes instrument possesses over all other existing systems, particularly in the matter of speed and power of working on long circuits, will probably give it the preference in the selection of telegraphic machines with which to work the Atlantic Submarine cable. Indeed it may well be doubted if any other system can be made practically available for that purpose.

The following brief summary of the telegraph lines of the world at the close of the year 1857 will furnish some idea of the importance of the telegraphic art, and of its claims to public attention:

United States have upward of 35,000 miles of telegraph, employing a capital, as near as can be ascertained, of $4,000,000. The instruments used are the Hughes, House, and Morse machines.

British Provinces have 5000 miles of telegraph, employing a capital of $500,000.

Cuba and Mexico have short and unreliable lines, which are controlled by the governments.

England has about 10,000 miles of telegraph lines—upward of 40,000 miles of conducting wire—employing a capital estimated at a million and a half pounds sterling. In England the government has the power of ordering all government messages to take precedence of any other communications, and when deemed necessary all telegraphs are required to be placed at the sole disposal of the government. Only one instance of this kind has occurred; on the occasion of the anticipated Chartist riots in April, 1849.

France has 8000 miles of telegraph in operation, under the exclusive control of the government.

Belgium has about 550 miles of telegraph lines, constructed and controlled by the government.

Germany and Austria have nearly 10,000 miles of telegraph, controlled by the governments.

Prussia has about 4000 miles of telegraph in operation. The wires are mostly underground—controlled by the government.

Holland has 600 miles of telegraph.

Saxony and Bavaria have government lines of about 1700 miles.

Italy has 2500 miles, controlled by its different governments.

Switzerland has 1500 miles, under control of the Federal government.

Spain and Portugal have some 800 miles—controlled by the governments.

Russia.—Of the number and extent of Russian telegraph lines little is known. As near as can be estimated, they extend over 5000 miles—under government control.

India has now in operation 5000 miles of telegraph, constructed and controlled by the East India Company.

Australia has 500 miles in operation, and 800 miles nearly or quite completed.

RECAPITULATION.

	Miles.
America	45,000
England	10,000
France	8,000
Germany and Austria	10,000
Prussia	4,000
Russia	5,000
Rest of Europe	7,650
India	5,000
Australia	1,200
Other parts of the world	500
Total length of telegraph lines...	95,350

The number of messages passing over all lines in the United States is estimated at about 4,000,000 per annum.

In addition to the land lines, numerous submarine cables have been laid in different parts of the world. Annexed is a brief account of the different submarine cables, lengths, when laid, etc.

The first submarine cable was laid between Dover, England, and Calais, France, during August, 1850. This cable was about 24 miles in length. Electrical communication between England and France continued uninterrupted for about a month, when the cable was broken. Upon examination it was found that the chafing of the cable against rocks off Cape Grienez had caused it to part. A second cable was immediately relaid, larger and stronger than its predecessor, which has remained in good working order up to the present time.

In May, 1852, a submarine cable was successfully laid between Holyhead and Howth, thus connecting England with Ireland. This cable is 64 miles in length.

During May, 1853, "the Port Patrick and Carrickfergus" cable, 24 miles in length, connecting Scotland and Ireland, was laid.

In June, 1854, a cable 115 miles in length was laid between Orfordness, England, and the Hague, Holland.

A third cable, 75 miles in length, was laid in 1852, between Dover and Ostend.

In 1854 cables from Italy to Corsica, thence to Sardinia, were, after much difficulty, successfully laid down, a distance of about 75 miles.

The New York, Newfoundland, and London Telegraph Company, in 1855 made an attempt to connect the islands of Newfoundland and Cape Breton. The attempt was unsuccessful. In 1856 another attempt was made, resulting in complete success.

Summary of Submarine Cables.—The following is a correct table of the number and length of the submarine cables laid down in different parts of the world:

Cables.	Miles.	Wires	Date.
Dover and Calais	24	4	1851
Dover and Ostend	75	6	1852
Holyhead and Howth	65	1	1852
England and Holland	115	3	1853
Port Patrick and Donaghadee	13	3	1853
Second cable do., do.	13	6	1853
Italy and Corsica	65	6	1854
Corsica and Sardinia	10	6	1854
Denmark, across the Great Belt	15	3	1854
Denmark, across the Little Belt	5	3	1854
Denmark, across the Sound	12	3	1855
Across the Frith of Forth (Scotland)	4	4	1855
Varna and Balaklava (across the Black Sea)	340	1	1855
Balaklava and Eupatoria	60	1	1855
Across the Danube, at Shumla	1	1	1855
Across the Hoogly River	21	–	....
Messina to Reggio	5	1	1856
Across the Gulf of St. Lawrence	74	1	1856
Across the Straits of Northumberland, Prince Edward Island	10½	1	1853
Across the Bosphorus, at Kandilli	1	1	1856
Across the Gut of Canso, Nova Scotia	—	3	1856
Six cables across the mouths of the Danube, at the Isle of Serpents, each one mile long and having one conductor	6	6	1857
Across the Mississippi, at Paducah	1	1	1851
From Petersburg to Cronstadt	10	1	1850
Across the St. Lawrence, at Quebec	—	1	1855
Across the Soland, Isle of Wight (Eng.)	3	4	1855
Small river crossings	20	–	....
Total length of submarine cables	950		

The total length of submarine cables laid down is 950 miles, and the length of the conducting wires in all is 2660 miles. Should the attempt to lay the great Atlantic Submarine Cable next June be successful, the length of cable laid down will be increased to 2564, and the length of conducting wires to 4075 miles.

The Atlantic Telegraph.—In the year 1856 Cyrus W. Field visited England. The result of his visit was the formation of the Atlantic Telegraph Company, with a capital of £350,000, for the purpose of connecting Europe with America by a submarine telegraph cable. In August, 1857, an attempt was made to lay down the Atlantic Submarine Cable, resulting in a disastrous failure. The cable was 2500 miles in length, weighing nearly one ton per mile, capable of bearing a direct strain of over five tons without fracture. The centre of the cable was formed by seven fine copper wires, twisted into a cord $\frac{1}{16}$ of an inch thick. This strand was coated with gutta percha, forming a small rope $\frac{3}{8}$ of an inch thick; then coated with hempen twine soaked in pitch and tar; lastly, an external sheathing of 18 iron wires, each wire being a strand of seven finer wires, making in all 126 wires. The submersion was commenced on the 5th August, 1857. There were present the six steamers, *Niagara*, *Agamemnon*, *Leopard*, *Susquehanna*, *Willing*, and *Mind*, intended to assist in various parts of the operation. The cable came up from the hold of the ship, around a central block, so to the open space above decks; it was there wound round grooved sheaths, geared together by cogs, and firmly planted on girders. Thence it passed over a fifth sheath, out over the stern into the sea, sinking by its own weight. A trifling accident happened on the 6th; this was repaired; and on the 11th, 380 miles (statute) had been submerged. The engineer here concluded that there was too much "slack" in the cable's course, and some modification in the machinery was consequently made. This appears to have been badly attended to by a subordinate. The cable snapped, and thus ended the attempt of 1857.

But little doubt is now entertained that the year 1858 will see this great enterprise successfully accomplished, and the Atlantic Submarine Cable a fixed fact.

In regard to the possibility of any transmission of signals with rapidity sufficient for practical use, it may be stated that on the 9th of October, 1856, a large number of scientific men met at the offices of the Magnetic Telegraph Company, in old Broad Street London, England, to witness the operation of telegraphing through upward of 2000 miles of subterranean and submarine wires, through England, Ireland, and the Irish Sea, connected for this experiment. Signals were sent throughout the entire distance with rapidity and certainty, 250 being transmitted per minute. Professor Morse, who was present, wrote as follows: "There can be no question but that, with a cable containing a single conducting wire, of a size not exceeding that through which we worked, it would be easy to telegraph from Ireland to Newfoundland at the speed of at least eight or ten words per minute. Take it at ten words in the minute, and allowing ten words for name and address, we can safely calculate upon the transmission of a twenty-words' message in three minutes; * * * * or fourteen thousand four hundred words per day. In one word, the doubts are resolved—the difficulties overcome; success is within our reach; and the great feat of the century must shortly be accomplished."

The cost of the telegraph cable has been as follows:

Price deep-sea wire per mile	$200
Price spun yarn and iron wire per mile	265
Price outside tar per mile	20
Total per mile	$485
For 2500 miles	$1,212,500
For 10 miles deep-sea cable, at $1450 per mile	14,500
For 25 miles shore ends, at $1250 per mile	31,250
Total cost	$1,258,250

We learn from the London *Times* that a prospectus has been issued of a company to complete the long-expected telegraphic communication with British Indian territories. It is to be called the European and Indian Junction Telegraph Company, with a capital of £200,000, in £10 shares. The line selected is the same as that for the Euphrates Railway—namely, from the port of Seleucia, on the Mediterranean, to the head of the Persian Gulf, following the valley of the Euphrates; and it will connect, on the one hand, with the Austrian system of telegraphs, which is to be carried to Seleucia, and on the other with a cable to be laid by the East India Company from the Persian Gulf to the Indian port of Kurrachee. It will, therefore, supply the only link necessary to enable messages to be transmitted from London to any of the several Presidencies. Direct pecuniary support is expected from the government and the East India Company, together with a concession from Turkey, and no call is to be made until these arrangements shall have been completed. One half the shares are to be allotted to the subscribers to the Euphrates Railway, and the other half to the public.

This, in connection with the proposed construction of a continuous line of railroad from Germany to Calcutta, shows that the trade of the East is gradually assuming more importance in the eyes of European capitalists and merchants.

Tender, Legal. Legal tender of money varies in different countries. Thus, in England, Bank of England notes (except by the bank itself) and gold are legal tender for any amount. Silver to the amount of 40 shillings only.

In the United States, the gold and silver coins of the United States were made legal tender by the act of January 18, 1837, viz.: That dollars, half-dollars, quarter-dollars, dimes, and half-dimes, shall be legal tender, according to their nominal value, for any sums whatever; the gold eagle at ten dollars, the half-eagle at five dollars, and the quarter-eagle for two and a half dollars. By the act of 1849 the coinage of the double eagle, value twenty dollars, and of the gold dollar, was authorized; both of which are legal tender for any amount.—*See* COINAGE.

Owing to the reduced weight of the new silver coins authorized by Congress 3d March, 1851, and 21st February, 1853, they are no longer legal tender except in small sums, viz.:

Three-cent pieces (Act March, 1851, and 1853)						30 cts.
Half-dollars,	192 grains each,	21st Feb., 1851				
Quarter-dollars	96	"	"	"	"	$5 00
Dimes	38-40	"	"	"	"	
Half-dimes	19-20	"	"	"	"	

By the act of February, 1857, "all former acts authorizing the currency of foreign gold and silver coins, and declaring the same a legal tender in payment of debts, are hereby repealed."

In the absence of any special agreement, the only payment known to the law is by cash. The tender should properly be in cash, and must be so, if that is required. A tender of a larger sum than is due, with a requirement of change or of the balance, is not good. A lawful tender, and payment of the money into court, is a good defense to an action for the debt. But the creditor may break down this defense by proving that he demanded the money of the debtor, and the debtor refused to give it, subsequently to the tender.—PARSONS *on Mercantile Law.*

Teneriffe, the largest island of the group called the Canaries, lies between Canary and Gomera. It is of an irregular shape, 60 miles in length, with an extreme breadth of 30 miles. Not more than one-seventh is cultivable. A chain of mountains traverses the island in the direction of its greatest length, and in the middle of the broadest part rises the celebrated peak locally known as the Pico de Teyde, which, with its supports and spurs, occupies nearly two-thirds of the whole island.

The Canary Islands are in the North Atlantic Ocean, between lat. 27° 40′ and 29° 30′ N., and long. 13° 30′ and 18° 20′ W. The names of the seven principal islands, their respective area in English square miles, and their population in 1835, are given in the following table:

Islands.	Area.	Population.
Teneriffe	817	85,000
Grand Canary	758	68,000
Palma	718	33,000
Lanzarote	322	17,400
Fuertaventura	326	13,800
Gomera	169	11,700
Hierro	93	4,400

Formerly the total annual produce was estimated at about 40,000 pipes, of which 25,000 pipes were produced in Teneriffe. Between 8000 and 9000 pipes were exported. The chief exports are wine, cochineal, barilla, and orchilla. The imports consist of woolen, silk, cotton, and iron manufactures, glass, etc.

Principal Ports.—The ports of Santa Cruz de Teneriffe, Orotava, Ciudad Real de los Palmas, Aneciffe de Langarole, Puerto de Cabras, and San Sebastian, in the Canary Islands, having been declared free by royal decree proclaimed on the 10th of October, 1852, and vessels of the United States and their cargoes arriving in said ports being thus placed on the same footing with those of Spain, no discriminating duty is levied on Spanish vessels and their cargoes arriving from those ports in the ports of the United States; provided that on every such arrival the required consular certificate be filed with the collector of the port.—*See* CANARIES.

COMMERCE OF THE UNITED STATES WITH TENERIFFE AND THE CANARIES, FROM OCTOBER 1, 1820, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Tennessee, one of the United States, lies between lat. 35° and 36° 30′ N., and long. 81° 30′ and 90° 10′ W. Its mean length is 400 miles, and its mean breadth 111 miles, containing 45,000 square miles. Population in 1790 was 35,691; in 1800, 105,602; in 1810, 261,727; in 1820, 422,813; in 1830, 681,904; in 1840, 829,210, and in 1850, 1,002,625. The soil is various, but generally fertile. The western part has a dark rich soil; in the middle are great quantities of excellent land. In the eastern part the mountains are mostly sterile, but the valleys are very fertile. The country has a great profusion of native timber, poplar, hickory, walnut, oak, beach, sycamore, locust, cherry, sugar-maple, etc. There are many medicinal plants. The soil produces abundantly cotton and tobacco, the staple commodities of the State; also grain, grass, and fruit. The eastern portion of the State contains the principal mineral deposits, among which are ores of iron, copper, lead, and beds

of coal. Mineral springs occur; granite and limestone abound. In the latter formation are many caverns of great extent; some have been explored for miles. There were in this State in 1850, 5,175,173 acres of land improved, and 13,808,849 unimproved land in farms. Cash value of farms, $97,851,212; and the value of implements and machinery, $5,360,210. *Live Stock.*—Horses, 270,636; asses and mules, 75,303; milch cows, 250,456; working oxen, 86,255; other cattle, 414,051; sheep, 811,591; swine, 3,104,800; value of live stock, $29,978,016.

Agricultural Products, etc.—Wheat, 1,619,386 bushels; rye, 89,137; Indian corn, 52,276,223; oats, 7,703,086; barley, 2737; buckwheat, 19,427; peas and beans, 369,321; potatoes, 1,067,844; sweet potatoes, 2,777,716; rice, 258,854 lbs.; value of products of the orchard, $52,894; produce of market gardens, $97,183; pounds of butter made, 3,139,585; of cheese, 177,681; sugar, 248 hhds.; maple-sugar, 158,557 lbs.; molasses, 7223 gallons; beeswax and honey, 1,036,572 lbs.; wool, 1,364,378 lbs. produced; cotton, 194,532; flax, 868,131; silk cocoons, 1923; hops, 1032; tobacco, 20,148,932 lbs.; hay, 74,091 tons; hemp, 597 tons; clover-seeds, 5096 bushels; other grass seeds, 9118; flax-seed, 18,901; and were made, 92 gallons of wine; value of home-made manufactures, $3,137,000; and of slaughtered animals, $6,401,000.

The Tennessee River has its chief source in this State; it is 1250 miles long, and is navigable for steamboats to Florence in Alabama, 276 miles above its entrance into the Ohio, and from the head of the Muscle Shoals for boats 250 miles farther. Cumberland River, which, rising in Kentucky, runs mainly in Tennessee, is navigable for steamboats 198 miles to Nashville, and for boats 300 farther. It enters the Ohio River in Kentucky, 60 miles from the Mississippi River. The Holston, Clinch, French, Broad, and Hiwassee, are branches of the Tennessee; Obion, Forked Deer, and Wolf rivers, in the western part of the State, flow into the Mississippi, and are navigable for boats.

Manufactures, etc.—There were in the State in 1850, 33 cotton factories, with a capital invested of $669,600, employing 310 males and 581 females, producing 363,250 yards of sheeting, etc., and 2,326,250 lbs. of yarn, valued at $510,624; four woolen factories, with a capital of $10,900, employing fifteen males and two females, manufacturing articles valued at $6310; 23 establishments making pig-iron, with a capital of $1,021,400, employing 1822 persons, producing 30,420 tons of pig-iron, etc., valued at $676,100; 16 establishments with a capital of $139,500, employing 269 persons, and making 3384 tons of castings, etc., valued at $264,325; 42 establishments with a capital of $755,050, employing 786 persons, manufacturing 10,348 tons of wrought iron, etc., valued at $670,618. Capital invested in manufactures, $7,044,144; value of manufactured articles, $9,413,701. There were in this State in 1857, 51 banks and branches, with an aggregate cash capital of $10,576,000; and in January, 1856, 15 railroads, with 455 miles of road completed and in operation.

Teredo, or Ship Worm. The following account of this worm is from a paper written by James Jarvis, who has been engaged since 1849 in a series of experiments concerning the teredo or ship worm, by order of Commodore Smith, chief of the Bureau of Yards and Docks. In order to ascertain the best composition for resisting the attacks of the teredo upon wood, he painted a number of blocks and boxes with various compounds—some he left unprepared, and some partly painted—and sunk them in Elizabeth River in the month of April. "About the 12th June the blocks and boxes were generally lifted and examined, but he never was able to discover any of the animalcule (young teredo) until about the 20th of June. At this period of the year he generally discovered minute holes in the wood by the use of a magnifying glass. After this the creature daily grows ahead, for it has no powers of locomotion; it grows like an oyster, and has a calcareous or shelly sheathing, which adheres to the surface of its burrow."

In Norfolk harbor, Virginia, they grow from six to twelve inches in length, and from three-eighths to half an inch in diameter. The wood excavated by one twelve inches long, in a season, amounted to more than a cubic inch, if in a solid piece. No signs of the teredo were discovered by him in wood deposited after. Mr. Jarvis supposes that the teredo commences to develop about the 1st of July, and continues until cold weather arrives; in Charleston, South Carolina, and further south, they develop during the whole year; whereas in the colder blasts, such as in the harbors of New England, they do but little injury, because the worm is feeble there, being like a fine thread. It is believed to be a native of the torrid seas. The teredo is not so destructive on piles sunk under water at New York city docks as those on the opposite side of the river, on the Jersey and Long Island shores; this is owing, Mr. Jarvis thinks, to the amount of filth carried down in the city sewers. In Boston, and Portsmouth, New Hampshire, harbor piles will stand twenty-five years. One open nail-hole in a sheet of copper upon a vessel's bottom will allow the worm access to pursue its work of destruction. All kinds of wood used in ship-building are attacked by it. To secure the bottoms of ships from the salt-water worm, and from coral deposits, Mr. Jarvis recommends putting three coats of white zinc paint on the dry bottom of the vessel, then copper them; and to make the whole invulnerable, put three more coats of white zinc paint upon the outer surface of the copper. To preserve piles, drive them with the bark on. There is no danger while the bark remains. The barnacle on piles does no injury. Charring is excellent, provided the fissures are well filled with hot coal tar or zinc paint, which will be found excellent to keep the shell-fish from the wood where piles may have the bark broken off before being driven.

Terra Japonica, the commercial name of catechu (cutch) and gambir. It is stated that it is obtained by boiling the wood of the trees of which it is a product. But cutch is also obtained direct from the tree by tapping in the same way as caoutchouc (India rubber). Terra japonica gives out the large portion of tannin which it contains more readily than oak bark or most other substances, and is, therefore, preferred by those tanners who work on the quick process. Latterly, also, it has been extensively used as a dye, producing a brown color.

Texas, the most southern State in the Union, is situated between lat. 26° and 36° 30′ N., and between long. 94° and 107° W. from Greenwich, and contains 325,520 square miles.

Early History of Texas.—The regions which we now comprise under the name of Texas, to the northwest of the Gulf of Mexico, were called by the Spanish governor of Jamaica, Garay, when his Captain, Pineda (1519), had sailed along them, *Provincia de Amichel*. It is a name of the origin of which we are quite in the dark. Perhaps, also, the whole northern shore of the Gulf was comprised under it. This expression, *Provincia de Amichel*, was pointed out as the original Indian name of the land. Because it was discovered by the exertions of Garay, the Spanish geographers, therefore, gave to it also the Spanish name, *Tierra de Garay* (Garay's country), which name we see on many old maps round the whole northern shore of the Gulf, including Texas. When (about 1521) the King of Spain divided the discoveries and governments of Cortez and Garay, and put the Rio de las Palmas as the northern boundary of the government of Mexico, the countries to the north were very often called *El Gobierno del Rio de los Palmas* (the government of the Palm River); and this also included a great part of the countries to the north. Because, however, the efforts of Garay to form a province in the north were

unfortunate, and because all the first attempts toward the north were either made from Mexico or from the peninsula of Florida, so these two names prevailed, and divided the whole region among each other. The great conquerors of the north, Narvaez and De Soto, entered from Cuba and from the peninsula of Florida. The names *Provincia Amichel, Tierra Garay, Gobierno del Rio de las Palmas*, disappeared soon after, and every thing round the whole Gulf of Mexico, up to the Palma River in the west, was comprised under the general name of Florida. As soon as Mexican travelers traversed the Palma River they considered themselves to be in Florida. When Moscoso (1542) made his excursion from the Red River westward to the centre of Texas, he found there innumerable herds of buffaloes, and called this country, from which he returned to the east, *La Provincia de los Vaqueros* (the province of the Herds). Some authors consequently gave that name to what we now call Texas. The Spaniards in Mexico commonly called all those wild Indians to the north of the civilized empire of Montezuma *Los Indios bravos* (the savage Indians), or *Los Chichimecas*. The whole country north of the Palma River was, therefore, very often designated as "the Province of the Chichimecas, or of the Savage Indians" (*La Provincia de los Chichimecas*, or *de los Indios bravos*). It was a custom from which also grew out the name of the Rio Bravo. When the French, under La Salle, arrived on the coasts of Texas (1685), they took possession of it under the name and as a part of their great country, *La Nouvelle France* (New France); which name, according to their notions, covered as much ground as the name of Florida, according to the Spanish ideas; that is to say, the whole eastern half of North America. The French from this time considered Texas to be a part of their dominion as far south as the Rio Bravo, and called it also Louisiana, when they had erected their Mississippi colony after 1699, and had given to it officially that name after 1712. All their old maps of Louisiana go as far down as Rio Bravo, and include Texas. Meanwhile the Spaniards had, however, taken actual possession of that province, and gave another name to it.

Some believe the word Texas to be Indian, and say that when Alonzo de Leon, in 1689, arrived among them he heard them often use the word Texas as a term of love or friendship. Others suppose that the word is Spanish, and that it implies some indication of "the manner of the Indians in constructing or covering tents or wigwams." But this seems a not well-founded supposition; for the Spanish word Teja (*plur.* Tejas) does not appear to have any thing to do with a covering of a tent or wigwam; it means simply "a tile."—See YOAKUM, *History of Texas*.

The first Frenchman who pronounced this name, in the year 1719, La Harpe (an officer in Louisiana, well known by his travels and writings), received it evidently through the Spaniar . He calls the country of the Cenis Indians *Las Tekas*. Some old French authors write also *La province de Lastikas*. In the year 1727, for the first time, a separate "governor for the province of Texas" alone was nominated; but this province extended then only as far south as the River Medina. The southwestern part of our present Texas belonged still for a long while to "the province of Coahuila."—YOAKUM, I. 393.

It is supposed that with this establishment of Texas as a new and separate government for itself (in 1727) was also connected an introduction of a new name—of *Las Nuevas Filipinas* (the new Philippines), given to this government in honor of King Philip V. At least neither Barcia nor any other author used this name before this time, while we afterward find it repeatedly in official papers and documents. The old and popular name of *Los Texas* was, however, used besides it. We see both names still on maps of a very late date; as, for instance, on a Mexican map of the year 1813, *Provincia de Texas o Nuevas Filipinas* (the province of Texas, or the new Philippines). Until 1824, the dominion of this name did, however, southward, not reach the Rio Bravo. The province of Coahuila and of Nuevo Sant Ander took away the whole southwestern quarter of Texas, as far east and north as the Rio Medina and the sources of the Colorado and Brazos. Eastward, toward Louisiana, the province of Texas and New Philippines extended to the neighborhood of the Red River, and on the shores of the Mexican Gulf to the Rio Calcasiu, and sometimes as far as the Merrmentau. In the year 1824, under the dominion of the Mexican Republic, the old connected provinces of Coahuila and Texas were again melted together into one state, under the name of *El Estado de Texas y Coahuila*. The southern part of our Texas, about the lower Rio Bravo, as far northeast as the Medina River, was not yet included in this name. It became a part of the new created *Estado de Tamaulipas*. Sometimes, and on some maps, it was tried at this period to apply to the whole of Texas the name of Fredonia, which was the particular name of Austin's colony. This has been done, for instance, in that otherwise excellent *Dictionnaire de Geographie*," edited by a society of French geographers. In the year 1836 Coahuila and Texas were divided again, and *Texas became a separate and independent State*, which was (1845) annexed to the United States, and received then, after the war of 1846, its present boundaries. These boundaries extend from this time along the Gulf of Mexico, from the mouth of the Rio Bravo in the south to the mouth of the Sabina in the east. To show how far and in what manner the boundaries of this name and State were extended toward the interior does not belong to our hydrographical researches.—J. G. KOHL.

The general aspect of the country is that of a vast inclined plane, gradually sloping from the mountains eastward to the sea, and traversed by numerous rivers, all having a southeast direction. It may be naturally divided into three regions; the first, which is level, extends along the coast with a breadth varying from 100 to 30 miles, being narrowest at the southwest. The soil of this region is principally a rich alluvion, with scarcely a stone, and singularly free from stagnant swamps. Broad woodlands fringe the banks of the rivers, between which are extensive and rich pasture lands. The second division, the largest of the three, is the undulating prairie region which extends for 150 or 200 miles farther inland, its wide, grassy tracts alternating with others that are thickly timbered. Limestone and sandstone form the common substrata of this section. The third, or mountainous region, situated principally on the west and southwest, forming part of the Sierra Madre, or Mexican Alps, is but little explored. At its remote extremity it consists of an elevated table-land, resembling the vast steppes of Asia, except in their superior fertility. The mountain sides are clothed with forests, and there are few, if any districts of country of the same extent as Texas, with so little unproductive land.

The principal rivers in the State are the Sabine, Neches, Trinidad, Brazos, Colorado, Guadaloupe, San Antonia, Nueces, and the Rio Grande. The Neches is navigable for small steamboats for more than 100 miles, Trinidad River for 300 or 400 miles, and the Brazos for half that distance. The Rio Colorado is obstructed by a raft 10 miles from its mouth; it will, when removed, be navigable for steamboats 200 miles to Austin City. The San Antonia and Neuces are navigable for only a short distance; but the Rio Grand del Norte, a noble stream, having a course of 1800 miles, will most probably, though in parts broken by rapids, become hereafter an important commercial channel. Galveston Bay, into which the Trinidad flows, is about 35 miles in length, and from 12 to 18 miles wide. The Gulf of Mexico bounds its southeastern border, on which are many bays and some good harbors. The Texan year

is divided into wet and dry seasons; the former lasts from December to March, and the latter from March to December. Snow is seldom seen except on the mountains. The country is in most parts covered with a luxuriant native grass, and it is amply supplied with timber, among which are the live oak, white, black, and post oak, hickory, walnut, sycamore, caoutchouc, etc., and on the high lands pine and cedar. The "Cross Timbers" are two lines of continuous forests of great extent. Cotton and sugar-cane are the great agricultural staples, both of which attain to great perfection. The grains chiefly cultivated are Indian corn and wheat. Peaches, melons, figs, oranges, lemons, pine-apples, dates, olives, grapes, etc., grow abundantly. Great numbers of cattle and horses are reared, and vast herds of buffaloes and wild horses wander over the prairies, while deer and game are abundant. Among its minerals are coal of a superior quality, iron ore, limestone, granite, slate, gypsum, etc. Silver mines have been wrought in the mountains, and bitumen and salt are abundant.

Manufactures, etc.—There were in the State in 1850 one woolen factory, with a capital invested of $8000, employing four males and four females, manufacturing 14,000 yards of cloth, etc., valued at $15,000; two establishments with a capital of $16,000, employing 35 persons, and making 200 tons of iron castings, etc., valued at $55,000; 38 flouring and grist mills, 89 sawmills, 22 tanneries, 34 printing-offices, three tri-weekly, two semi-weekly, and 32 weekly publications. Capital invested in manufactures, $613,238; value of manufactured articles, $1,202,885.

The principal places in the State are Austin, the capital, Galveston, Houston, Washington, Matagorda, San Felipe de Austin, San Augustine, Nacogdoches, San Antonia de Bexar, Corpus Christi, and Brownville. There were, January 1st, 1856, 36 miles of railroad built.

—*See* SPANISH COLONIES for commerce prior to the year 1846.

Thaler, a German silver coin, first coined in Joachimsthal, a valley in Bohemia. The value of the thaler is about seventy cents.—*See* COINS, GERMANY, and DOLLAR.

Thames (*Tamesis*), the principal though not the longest river of England, through the south part of which it flows mostly in an easterly direction. It rises under the name of the Isis, about two miles south of Cirencester, and 376 feet above the sea, flows at first south to near Cricklade, then east-northeast past Lechlade to near Oxford, and southeast past Oxford, Abingdon, and Wallingford to Reading, after which its course is mostly eastward to Gravesend. A few miles beyond this it expands into an estuary, which at its junction with the North Sea at the Nore, between the Isle of Sheppey and Foulness Point, is fifteen miles across, and has on its opposite banks the towns Sheerness and Southend. Total course estimated at 215 miles. At Dorchester it receives the Thamer from the north, and thenceforth assumes its proper name; other principal affluents are the Churnet, Coln, Wainrush, Evenlode, Cherwell, Colne, Brent, Lea, and Roding from the north, and the Cole, Konnet (its chief affluent), Wey, Mole, and some smaller rivers from the south. The Mersey joins its estuary at Sheerness. Its basin is of less size than that of the Severn, but no river in the world has more commercial importance. The tide flows up it for about eighty miles; it is navigable for ships of any burden to Deptford, for vessels of 200 tons to London Bridge, and for barges 130 miles farther, where it is united by the Thames and Severn Canal with the Severn, below Gloucester; it is also connected with all the centre of England by the Oxford and Warwick and Grand Junction Canals, and by other canals with Bristol, Basingstoke, Arundel, etc. Under the Romans it formed the north boundary of the province of *Britannia prima*.

The Thames is the richest river in the world. It has been erroneously said that its name is Isis till it arrives at Dorchester, when, being joined by the Thame or Tame, it assumes the name of Thames. What was the origin of this common error can not now be traced: poetical fiction, however, has perpetuated the error, and invested it with a kind of classical sanctity. It was called Thames or Tems before it came near the Thame.—CAMDEN. The river rose so high at Westminster that the lawyers were brought out of the hall in boats, A.D. 1235. Again it rose to great height, 1736, 1747, 1762, and 1791. The conservation of the Thames was given to the mayors of London, 1489. The Thames was made navigable to Oxford, 1624. It ebbed and flowed twice in three hours, 1658. Again, three times in four hours, March 22, 1682. Again, twice in three hours, November 24, 1777.—*See article* TUNNEL.

Thermometer. The invention of this instrument is ascribed to several scientific persons, all about the same time. Galileo, 1597.—LIBRI. Invented by Drebbel of Alcmaer, A.D. 1609.—BOERHAAVE. Invented by Paulo Larpi in 1609.—FULGENTIO. Invented by Sanctorio in 1610.—BORELLI. Fahrenheit's thermometer was invented about 1720; and the scale called Reaumur's soon after, 1730. The mode of construction by substituting quicksilver for spirits was invented some years subsequently.—HAYDN.

Thimble. This simple yet useful, and now indispensable appendage to the ladies' work-table, is of Dutch invention. The art of making them was brought to England by John Lofting, a mechanic from Holland, who set up a work-shop at Islington, near London, and practiced the manufacture of them in various metals with profit and success, about 1695.—HAYDN.

Thread (Ger. *Zwirn*; Du. *Garen*; Fr. *Fil*; It. *Refe*; Sp. *Hilo*, *Torzal*; Russ. *Nitki*), a small line made up of a number of fibres of some vegetable or animal substance, such as flax, cotton, or silk; whence its names of linen, cotton, or silk thread.—*See* COTTON MANUFACTURE.

Tide Gauge, a mechanical contrivance for registering the state of the tide continuously at every in-

stant of time. In the *Philos. Trans.* for 1838, there is a description of a very complete self-registering machine for this purpose, erected at Bristol by Mr. Bunt. The principal parts are an eight-day clock, which turns a vertical cylinder revolving once in twenty-four hours; a wheel, to which an alternate motion is communicated by a float rising and falling with the tide, and connected with the wheel by a wire passing over a pulley, and kept constantly strained by a counterpoise; and a small drum on the same axis with the wheel, which, by a suspending wire, communicates one-eighteenth of the vertical motion of the float to a bar carrying a pencil, which describes a curve on the cylinder, and thereby marks the fluctuations, and the time and height of high water.

Tides, the alternate rise and fall of the waters of the ocean. The moon is the principal agent in the production of the tides; but they are modified, both with respect to their height and the times at which they happen, by the action of the sun. The effect of the planets is inappreciable. Homer is the earliest profane author who speaks of the tides. Posidonius of Apamea accounted for the tides from the motion of the moon, about 79 B.C.; and Cæsar speaks of them in his fourth book of the Gallic War. The theory of the tides was first satisfactorily explained by Kepler, A.D. 1598; but the honor of a complete explanation of them was reserved for Sir Isaac Newton, who laid hold of this class of phenomena to prove universal gravitation, about 1683.

The attractive force of a body on a distant particle of matter varying inversely as the square of the distance, the particles of the earth on the side next the moon will be attracted with a greater, and those on the opposite side with a smaller force, than those which are situated intermediately. The gravitation toward the earth's centre of the particles nearest the moon will therefore be diminished, and consequently, if at liberty to move among themselves, they will rise above the general level. In like manner, the moon's attraction on the most distant particles being less than on the central ones, their relative gravitation toward the centre will also be diminished, and the waters will consequently be heaped up on the side of the earth which is turned away from the moon. Hence, if the earth were at rest, the ocean would take the form of an oblong spheroid, with its longer axis passing through the attracting body; and it may be shown from theory that the spheroid would be in equilibrium under the influence of the moon's attraction, if the longer semi-axis exceeded the shorter by about 58 inches. But in consequence of the rapid rotation of the earth about its axis, the spheroid of equilibrium is never fully formed; for before the waters can take their level, the vertex of the spheroid has shifted its position on the earth's surface, in consequence of which an immensely broad and very flat wave is formed, which follows the motions of the moon at some interval of time. In the open sea the time of high water is, in general, from two to three hours after the moon's transit over the meridian either above or below the horizon. The tidal wave, it is to be observed, is entirely different from a current: the particles of water merely rise and fall; but except when the wave passes over shallows, or approaches the shore, there is little or no progressive motion.

The waters of the ocean are affected in a similar manner by the action of the sun, under the influence of which they have a tendency to assume at every instant the form of an elongated spheroid; but although the attractive force of the sun is immensely greater than that of the moon, yet, by reason of the greater distance of the sun, the *difference* of the effect on particles situated on opposite sides of the earth (on which difference the phenomena depend) is very much less. The solar tides are therefore comparatively small with respect to the lunar tides, and, in fact, are never perceived as distinct phenomena, but become sensible only from the modifications which they produce in the heights and times of those which primarily depend on the moon. At the syzygies, when the sun and moon come to the meridian together, the tides are, *ceteris paribus*, the highest; at the quadratures, or when the sun and moon are 90° distant, the tides are least. The former are called *spring tides*, the latter *neap tides*. Although we are not in possession of data to enable us to compute the exact height either of the spring or neap tides, yet their relative heights in the open ocean probably correspond very nearly to the ellipticities of the spheroids of equilibrium that would be formed under the action of the two bodies exerted separately. Now the ellipticity of the aqueous spheroid formed by the moon's action is about five feet, and the ellipticity of that formed by the sun's action about two feet; therefore, the spring and neap tides being the sum and difference of the separate effects, the average spring tide will be to the average neap in the ratio of about 7 to 3.

The apparent time of high water at any port, in the afternoon of the day of new or full moon, is what is usually called the *establishment of the port*. Mr. Whewell calls this the *vulgar* establishment, and the mean of all the intervals of tide and transit for a half lunation he terms the *corrected* establishment. This corrected establishment is consequently the lunitidal interval corresponding to the day on which the moon passes the meridian exactly at noon or midnight.

The two tides immediately following one another, or the tides of the day and night, vary, both in height and time of high water, at any particular place with the distance of the sun and moon from the equator. As the vertex of the tide wave always tends to place itself vertically under the luminary which produces it, it is evident that, of two consecutive tides, that which happens when the moon is nearest the zenith or nadir will be greater than the other; and consequently, when the moon's declination is of the same denomination as the latitude of the place, the tide which corresponds to the upper transit will be greater than the opposite one, and *vice versa*, the differences being greatest when the sun and moon are in opposition, and in opposite tropics. This is called the *diurnal inequality*, because its cycle is one day; but it varies greatly at different places, and its laws, which appear to be governed by local circumstances, are very imperfectly known.

We have now described the principal phenomena that would take place were the earth a sphere, and covered entirely with a fluid of uniform depth. But the actual phenomena of the tides are infinitely more complicated. From the interruption of the land, and the irregular form and depth of the ocean, combined with many other disturbing circumstances, among which are the inertia of the waters, the friction on the bottom and sides, the narrowness and length of the channels, the act. of the wind, currents, difference of atmospheric pressure, etc., great variation takes place in the mean times and height of high water at places differently situated; and the inequalities above alluded to, as depending on the parallax of the moon, her position with respect to the sun, and the declination of the two bodies, are, in many cases, altogether obliterated by the effects of the disturbing influences, or can only be detected by the calculation and comparison of long series of observations.

By reason of these disturbing causes, it becomes a matter of great difficulty to trace the propagation of the tide wave, and the connection of the tides in different parts of the world. In the *Philosophical Transactions* for 1832, Sir John Lubbock published a map of the world, in which he inserted the times of high water at new and full moon at a great number of places on the globe, collected from various sources, as works on navigation, voyages, sailing directions, etc.; and,

in order that the march of the tide wave might be traced more readily, the times were expressed in Greenwich time as well as the time of the place. In the same *Transactions* for 1833, Mr. Whewell prosecuted this subject at greater length; and availing himself of *à priori* considerations, as well as of a mass of information collected in the hydrographer's office at the Admiralty, inserted in the map a series of *cotidal lines*, or lines along which high water takes place at the same instant of time. But these cotidal lines, as Sir J. Lubbock remarks, are entirely hypothetical; for we have few opportunities of determining the time of high water at a distance from the coast, though this is sometimes possible by means of a solitary island, as St. Helena.—Lubbock's *Elementary Treatise on the Tides*, 1839.

According to Mr. Whewell's deductions, the general progress of the great tide wave may be thus described: It is only in the Southern Ocean, between the latitudes of 50 and 70 degrees, that a zone of water exists of sufficient extent to allow of the tide wave being formed. Suppose, then, a line of contemporary tides, or *cotidal lines*, to be formed in the Indian Ocean, as the theory supposes, that is to say, in the direction of the meridian, and at a certain distance to the eastward of the meridian in which the moon is. As this tide wave passes the Cape of Good Hope, it sends off a derivative undulation, which advances northward up the Atlantic Ocean, preserving always a certain proportion of its original magnitude and velocity. In traveling along this ocean the wave assumes a curved form, the convex part keeping near the middle of the ocean, and ahead of the branches, which, owing to the shallower water, lag behind on the American and African coasts; so that the cotidal lines have always a tendency to make very oblique angles with the shore, and, in fact, run nearly parallel to it for great distances. The main tide, Mr. Whewell conceives, after reaching the Orkneys, will move forward in the sea bounded by the shores of Norway and Siberia on the one side, and those of Greenland and America on the other, will pass the pole of the earth, and finally end its course on the shores in the neighborhood of Behring's Straits. It may even propagate its influence through the straits, and modify the tides of the North Pacific. But a branch tide is sent off from this main tide into the German Ocean; and this, entering between the Orkneys and the coast of Norway, brings the tide to the east coast of England, and to the coasts of Holland, Denmark, and Germany. Continuing its course, part of it, at least, passes through the Strait of Dover, and meets in the British Channel the tide from the Atlantic, which arrives on the coast of Europe twelve hours later; but in passing along the English coast, another part of it is reflected from the projecting land of Norfolk upon the north coast of Germany, and again meets the tide wave on the shores of Denmark. Owing to this interference of different tide waves, the tides are almost entirely obliterated on the coast of Jutland, where their place is supplied by continual high water.

In the Pacific Ocean the tides are very small, but there are not sufficient observations to determine the forms and progress of the cotidal lines. Off Cape Horn, and round the whole shore of Terra del Fuego, from the western extremity of the Strait of Magalhaens to Staten Island, it is very remarkable that the tidal wave, instead of following the moon in its diurnal course, travels to the *eastward*. This, however, is a partial phenomenon; and a little farther to the north of the last-named places the tides set to the north and west. In the Mediterranean and Baltic seas the tides are inconsiderable, but exhibit irregularities for which it is difficult to account. The Indian Ocean appears to have high water on all sides at once, though not in the central parts at the same time.

Since the tides on our coasts are derived from the oscillations produced under the direct agency of the sun and moon in the Southern Ocean, and require a certain interval of time for their transfer, it follows that, in general, the tide is not due to the moon's transit immediately preceding, but is regulated by the position which the sun and moon had when they determined the primary tide. The time elapsed between the original formation of the tide and its appearance at any place is called the *age* of the tide, and sometimes, after Bernoulli, the *retard*. On the shores of Spain and North America the tide is a day and a half old; in the port of London it appears to be two days and a half old when it arrives.

Velocity of the Tide Wave.—In the open ocean the crest of the tide travels with enormous velocity. If the whole surface were uniformly covered with water, the summit of the tide wave, being mainly governed by the moon, would every where follow the moon's transit at the same interval of time, and consequently travel round the earth in a little more than twenty-four hours. But the circumference of the earth at the equator being about 25,000 miles, the velocity of propagation would therefore be about 1000 miles per hour. The actual velocity is perhaps nowhere equal to this, and is very different at different places. In latitude 60° south, where there is no interruption from land (excepting the narrow promontory of Patagonia), the tide wave will complete a revolution in a lunar day, and consequently travel at the rate of 670 miles an hour. On examining Mr. Whewell's map of cotidal lines, it will be seen that the great tide wave from the Southern Ocean travels from the Cape of Good Hope to the Azores in about twelve hours, and from the Azores to the southernmost point of Ireland in three hours more. In the Atlantic the hourly velocity in some cases appears to be 10° of latitude, or near 700 miles, which is almost equal to the velocity of sound through the air. From the south point of Ireland to the north point of Scotland the time is eight hours, and the velocity about 160 miles an hour along the shore. On the eastern coast of Britain, and in shallower water, the velocity is less. From Buchanness to Sunderland it is about sixty miles an hour; from Scarborough to Cromer, thirty-five miles; from the North Foreland to London, thirty miles; from London to Richmond thirteen miles an hour in that part of the river.—Whewell, *Phil. Trans.*, 1833 and 1836. It is scarcely necessary to remind the reader that the above velocities refer to the transmission of the undulation, and are entirely different from the velocity of the current to which the tide wave gives rise in shallow water.

Theory of the Tides.—The theory of the tides, considered as a consequence of solar and lunar attraction, was first sketched by Newton in the *Principia*. In the 36th and 37th propositions of the third book, he determines the forces of the sun and moon to elevate the waters of the ocean, on the supposition that the sea is a fluid of the same density as the earth, covering the whole terrestrial surface, and which takes at every instant the figure of equilibrium. He assumes, without demonstration, that this figure is an elongated spheroid. One spheroid he supposes to be formed under the action of the sun, another under the action of the moon; and, by reason of the smallness of their eccentricities, they may be conceived as superposed the one on the other. From these suppositions he deduced the general phenomena of the ebb and flow of the sea; and by comparing his theory with observations of the heights of the spring tides made at the mouth of the Avon, near Bristol, he determined the ratio of the attraction of the moon to that of the sun to be nearly 4·48 to 1; whence he deduced the mass of the earth to be to that of the moon as 39·788 to 1, the density of the sun to that of the earth as 1 to 4, and the density of the moon to that of the earth as 11 to 9. Newton's theory was defective in many points of view, but fifty

years elapsed before it received any improvement. In 1738 the subject of the tides was proposed as a prize question by the French Academy of Sciences, which gave occasion to the celebrated treatises of Daniel Bernoulli, Maclaurin, and Euler. Maclaurin's Essay is remarkable, as containing a demonstration of the theorem assumed by Newton, that the elliptic spheroid affords an equilibrium under the action of the disturbing forces: those of Bernoulli and Euler, though they furnish no new principle of equal or similar importance in point of theory, enter more into details, and contain many useful illustrations. That of Bernoulli, indeed, contains a table which has served as the model for all those (not purely empirical) which have since been formed. The next important step in the theory of the tides was taken by Laplace, who first treated the subject as a general question of hydrodynamics, and attempted to deduce the principal phenomena from the equations of the motions of fluids. But in order to simplify the equations, which are of a very complicated nature, he was forced to have recourse to the hypothesis of a fluid covering entirely a spheroid of a regular surface, and consequently the results were far from representing the actual observations of the tides at any port. The late Thomas Young (*Ency. Brit., article* TIDES) extended Laplace's method to the more general case of an ocean covering a part only of the earth's surface, and more or less irregular in its form, and attempted also to include in his calculation the effects of hydraulic friction on the times and magnitudes of the tides.

Influence of Atmospheric Pressure and Winds.—Besides the numerous causes of irregularity depending on the local circumstances, the tides are also affected by the state of the atmosphere. At Brest, the height of high water varies inversely as the height of the barometer, and rises more than eight inches for a fall of about half an inch of the barometer. At Liverpool, a fall of one-tenth of an inch in the barometer corresponds to a rise in the River Mersey of about an inch; and at the London Docks, a fall of one-tenth of an inch corresponds to a rise in the Thames of about seven-tenths of an inch. With a low barometer, the tides may therefore be expected to be high, and *vice versa*. The tide is also liable to be disturbed by winds. Sir J. Lubbock states that, in the violent hurricane of January 8, 1839, "there was no tide at Cainsborough, which is twenty-five miles up the Trent—a circumstance unknown before. At Salmarsh, only five miles up the Ouse from the Humber, the tide went on ebbing, and never flowed till the river was dry in some places; while at Ostend, toward which the wind was blowing, contrary effects were observed. During strong northwesterly gales the tide marks high water earlier in the Thames than otherwise, and does not give so much water, while the ebb-tide runs out late, and marks lower; but upon the gales abating and the weather moderating, the tides put in, and rise much higher while they also run longer before high water is marked, and with more velocity of current; nor do they run out so long or so low.—BRANDE'S *Cyclopædia*.

The tidal observations of the Pacific coast have casually led to a determination of great scientific interest, that of the average depth of the Pacific Ocean between the coasts of Japan and California. On the 23d of December, 1854, an earthquake occurred in Japan by which the town of Simoda, in the island of Niphon, was destroyed. From the imperfect accounts which have reached us, it appears that at nine A.M. on that day the severe shock of an earthquake was felt on board the Russian frigate *Diana*, then lying in the harbor of Simoda. Half an hour later the sea came into the bay in an immense wave thirty feet in height, overwhelming the town and then receding. This advance and recession occurred five times, and by 2:30 P.M. all was again quiet. The depth of the sea during these changes varied from less than eight to more than forty feet. Upon the same day an extraordinary rise and fall of water was observed at Peel's Island, one of the Bonin Islands, and the tide continued to rise and fall during the day at intervals of fifteen minutes, gradually lessening until evening.—*American Journal of Science*, January, 1858 [Prof. BACHE].

The following table contains the revised data for the principal tidal elements of a number of points on the coast of the United States, with additions to the tables published last year, furnished by the discussions of the tidal observations. These elements are selected from a large number of results obtained in the progress of the Coast Survey, only those stations being reported, as a general rule, where the observations extended through at least two lunations.

GENERAL TIDE TABLE FOR THE COAST OF THE UNITED STATES.

* Varying between 20 and 24 feet of water.

† The highest tides occur at the moon's greatest declination, and are applied in the column headed "Spring Tides."

Range of the Tide.—The difference of level between high and low water is affected by various causes, but chiefly by the configuration of the land, and is very different at different places. In deep inlends of the shore, open in the direction of the tide wave, and gradually contracting like a funnel, the convergence of the water causes a very great increase of the range. Hence the very high tides in the Bristol Channel, the Bay of St. Malo, and the Bay of Fundy, where the tide is said to rise sometimes to the height of 100 feet. Promontories, under certain circumstances, exert an opposite influence, and diminish the tide.

Tide-rips.—Near the equator, and especially on this side of it in the Atlantic, mention is made, in the "abstract log," by almost every observer that passes that way, of "tide-rips," which are a commotion in the water, not unlike that produced by a conflict of tides or of other powerful currents. These "tide-rips" sometimes move along with a roaring noise, and the inexperienced navigator always expects to find his vessel drifted by them a long way out of her course; but when he comes to cast up his reckoning the next day at noon, he remarks with surprise that no current has been felt. Tide-rips are usually found in the neighborhood of the equatorial calms—that region of constant precipitation. And hence, if currents at all—if so, they are very superficial—I have thought they might be streams of rain-water, which old seamen tell us they have dipped up there fresh from the sea, running off. This conjecture, however, does not satisfy the phenomenon in all of its aspects. It is sometimes described as starting up in a calm, and then approaching the vessel with great waves and a great noise; it seems threatening enough to excite a feeling of apprehension in the minds of seamen, for it looks as if it would dash over their frail bark as it lies wallowing in the sea, and helplessly flapping its sails against the masts. Captain Higgins, of the *Maria*, when bound from New York to Brazil, thus describes, in his abstract log, one of these "tide-rips," as seen by him, 10th October, 1855, in lat. 14° N., long. 34° W.: "At three P.M. saw a tide-rip; in the centre, temperature of air 80°, water 81°. From the time it was seen to windward, about three to five miles, until it had passed to leeward out of sight, it was not five minutes. I should judge it traveled at not less than sixty miles per hour, or as fast as the bores of India. Although we have passed through several during the night, we do not find they have set the ship to the westward any; it may be that they are so soon passed that they have no influence on the ship, but they certainly beat very hard against the ship's sides, and jarred her all over. They are felt even when below, and will wake one out of sleep."—MAURY's *Physical Geography*. For further information as to TIDES, refer to *Amer. Jour. of Sci.*, xxxiv. 81, xvi. 78, xx. 205, xliv. 118, xii. (2d series) 341 (A. D. BACHE); *South. Lit. Mess.*, iv. 747; *Mass. Quart. Rev.*, ii. 77; *Quart. Rev.*, vi. 74; *Anal. Mag.*, ix. 231.

Tiles (Ger. *Dachziegel*; Fr. *Tuiles*; It. *Tegole, Embrici*; Sp. *Tejas*; Russ. *Tscherepiza*), a sort of thin bricks, dried in kilns, and used in covering and paving different kinds of buildings. The best brick earth only should be made into tiles.

Timber (Ger. *Bauholz, Zimmer*; Du. *Timmerhout*; Fr. *Bois de charpente, Bois à bâtir*; It. *Legname da fabbricare*; Sp. *Madera de construccion*; Russ. *Stroëwoi Cess*; Pol. *Cembrowina*), the term used to express every large tree squared, or capable of being squared, and fit for being employed in house or ship-building. In the language of the English customs, when a tree is sawn into thin pieces, not above seven inches broad, it is called batten; when above that breadth, such thin pieces are called deal. Wood is the general term, comprehending under it timber, dye-woods, fire-wood, etc.

The following are the contents of the loads of different species of timber, hewn and unhewn:

A load of timber, unhewn	40	cubic feet.
" square timber	50	"
" 1 inch plank	600	square feet.
" 1½ inch plank	400	"
" 2 inch plank	300	"
" 2½ inch plank	240	"
" 3 inch plank	200	"
" 3½ inch plank	170	"
" 4 inch plank	150	"

36½ Russian standard deals, 12 feet long, 1½ inch thick, 11 inches broad, make 1 load of timber.
58½ Christiana standard deals, 11 feet long, 1½ inch thick, 9 inches broad, make 1 load of timber.
53½ Dram standard deals, 10 feet long, 1½ inch thick, 9 inches broad, make 1 load of timber.
3 Riga logs make 1 load of timber.
—*See* LUMBER TRADE.

The annual demand of timber for the British navy, in war, is 60,000 loads, or 40,000 full-grown trees, a ton each, of which thirty-five will stand on an acre; in peace, 32,000 tons, or 48,000 loads. A seventy-four gun ship consumes 3000 loads, or 2000 tons of trees, the produce of fifty-seven acres in a century. Hence the whole navy consumes 102,600 acres, and 1026 per annum.—ALLNUT. England imports about 800,000 loads of timber annually, exclusively of masts, yards, staves, lathwood, etc., together with about 8,000,000 of deals and deal-ends.—*Parl. Ret.*

To overcome the difficulty of bending timber, a method has been discovered which, to judge from the accounts given by the most eminent engineers, both of America and England, will be of the greatest service in ship-building and domestic architecture, and in the construction of all pieces of furniture in which it is necessary to employ curved timber. It has been already so employed in the United States.

By this invention, which has been patented in America, the strength of the wood is increased at least 75 per cent. at the point where strength is most required. The curve, moreover, never relaxes. The timber, as in the old process, is first subjected to the influence of steam, which softens the whole mass, and puts it in a fit state for the action of a machine. The principle of

bending, as employed in this new application, is based on end-pressure, which, in condensing and turning at the same time, destroys the capillary tubes by forcing them into each other. These tubes are only of use when the tree is growing; and their amalgamation increases the density of the timber, the pressure being so nicely adjusted that the wood is neither flattened nor spread, nor is the outer circumference of the wood expanded, though the inner is contracted. Now the error of the former process, as expounded by competent judges, has arisen from the disintegrating of the fibre of the wood by expanding the whole mass over a rigid mould. Wood can be more easily compressed than expanded; therefore, it is plain that a process which induces a greater closeness in the component parts of the piece under operation—which, as it were, locks up the whole mass by knitting the fibres together—must augment the degree of hardness and power of resistance. The wood thus becomes almost impervious to damp and to the depredations of insects, while its increased density renders it less liable to take fire; and the present method of cutting and shaping timber being superseded, a saving of from two to three-fourths of the material is brought about. The action of the machine throws the cross-grains into right angles; the knots are compelled to follow the impulse of the bending; the juices are forced out of the cells of the wood, and the cavities are filled up by the interlacing fibres. In the same way, you may sometimes see in the iron of which the barrels of muskets are made a kind of dark grain which indicates that the particles of the metal, either in the natural formation or in the welding, have been strongly clinched in one another. The specimens are always greatly valued for their extraordinary toughness, as well as for a certain fantastical and mottled beauty.

Another of the good results of this new method is that the wood is seasoned by the same process as that which effects the bending. The seasoning of the wood is simply the drying of the juices, and the reduction of the mass to its minimum size before it is employed, so that there shall be no future warping. But, as we have already shown, the compression resorted to in the American system at once expels the sap; and a few hours are sufficient to convert green timber into thoroughly seasoned wood. Here is an obvious saving of time, and also of money; for the ordinary mode of seasoning, by causing the wood to lie waste for a considerable period, locks up the capital of the trader, and of course enhances the price to the purchaser. Time also will be saved in another way, in searching for pieces of wood of the proper curve for carrying out certain designs. "How delighted," says Mr. Jervis, the United States inspector of timber, "will the shipwright be to get clear of the necessity of searching for crooked pieces of timber! There need no longer be any breaking of bats in the frame, as we have been wont to break them. We shall see numbers one, two, and three futtocks, at least, all in one piece." An English engineer (Mr. Charles Mayhew) remarks, that one of the advantages of the American method is that, "in its application to all circular, wreathed, or twisted work, it not only preserves the continuous grain of the wood, which is now usually and laboriously done by narrow slips of veneer glued on cores cut across the grain, with many unsightly joints, ill concealed at best; but it will materially reduce the cost of all curved work, which now varies according to the quickness of the sweep, and will give the artist greater freedom in his design, by allowing him to introduce lines which are now cautiously avoided in order to prevent the cost of their execution." Dr. Hooker, Mr. Fairbairn, Mr. Rennie, Mr. Gallway, civil engineer, and other eminent scientific men, confirm these judgments. A specimen of bent oak now lies before us, and exhibits a beautiful continuity in the sweep of the fibres. Timber-bending has reached a new stage of development; and it is not too much to anticipate that it will have considerable influence on the industrial arts.

Tin (Ger. *Blech, Weissblech*; Fr. *Fer blanc*; It. *Latta, Banda stagnata*; Sp. *Hoja de lata*; Russ. *Blächa, Shest*; Arab. *Resas*; Sans. *Trapu* and *Ranga*), a metal which has a fine white color like silver; and when fresh, its brilliancy is very great. It has a slightly disagreeable taste, and emits a peculiar smell when rubbed. Its hardness is between that of gold and lead. Its specific gravity is 7·29. It is very malleable; *tin-foil*, or tin leaf, is about $\frac{1}{1000}$th part of an inch thick; and it might be beat out into leaves as thin again, if such were required for the purposes of art. In ductility and tenacity it is very inferior. A tin wire 0·078 inch in diameter is capable of supporting a weight of 34·7 pounds only without breaking. Tin is very flexible, and produces a crackling noise when bent. It may be readily alloyed with copper, zinc, etc., forming very valuable compounds.—THOMSON'S *Chemistry*.

The Phœnicians traded with England for this article for more than 1100 years before the Christian era. It is said that this trade first gave them commercial importance in the ancient world. Under the Saxons, our tin mines appear to have been neglected; but after the coming in of the Normans, they produced considerable revenues to the earls of Cornwall, particularly to Richard, brother of Henry III.; a charter and various immunities were granted by Edmund, Earl Richard's brother, who also framed the stannary laws, laying a duty on the tin, payable to the earls of Cornwall Edward III. confirmed the tinners in their privileges, and erected Cornwall into a dukedom, with which he invested his son, Edward the Black Prince, 1337. Since that time, the heirs apparent to the crown of England, if eldest sons, have enjoyed it successively. Tin mines were discovered in Germany, which lessened the value of those in England, till then the only tin mines in Europe, A.D. 1240.—ANDERSON. Discovered in Barbary, 1640; in India, 1740; in New Spain, 1782. England exports at present, on an average, 1500 tons of unwrought tin, besides manufactured tin and tin-plates, of the value of about £400,000.

The ores of this metal are found in comparatively few places; the principal, and perhaps the only, ones are Cornwall, Galicia, Erzgebirge in Saxony, Bohemia, the Malay countries, China, and Banca in Asia. They are peculiar to primitive rocks, generally in granite, either in veins or beds, and are often associated with copper and iron pyrites. Tin is much used as a covering to several other metals: iron is tinned, to prevent its rapid oxydation when exposed to air and moisture; and the same process is applied to copper, to avoid the injurious effects to which those who are in the habit of employing cooking utensils made of this metal are always liable. The solutions of tin in the nitric, muriatic, nitro-sulphuric, and tartaric acids, are much used in dyeing, as giving a degree of permanency and brilliancy to several colors, to be obtained by the use of no other mordants with which we are at present acquainted: tin forms the basis of pewter, in the composition of which it is alloyed with lead; when rolled into thin sheets, it is called tin-foil, and is applied, with the addition of mercury, to cover the surface of glass, thus forming looking-glasses, mirrors, etc.; and in combination with sulphur, it constitutes what is called mosaic gold.—JOYCE'S *Chem. Min.* Tin plates, known in Scotland by the name of *white iron*, are applicable to a great variety of purposes. They are formed of thin plates of iron dipped into molten tin. The tin not only covers the surface of the iron, but penetrates it completely, and gives the whole a white color. It is usual to add about one-tenth of copper to the tin, to prevent it from forming too thick a coat upon the iron. —THOMSON'S *Chemistry*.

British Tin Trade.—The tin mines of Cornwall have been worked from a very remote era. The voyages

of the Phœnicians to the Cassiterides, or tin islands, are mentioned by Herodotus (lib. iii. c. 115), Diodorus Siculus (lib. iv. p. 301, ed. 1604), and Strabo (*Geog.*, lib. iii.). Some difference of opinion has, indeed, been entertained as to the particular islands to which the Phœnicians applied the term Cassiterides; but Borlase (*Account of the Scilly Islands*, p. 72), Larcher (*Herodote*, tome iii. p. 384, ed. 1802), and the ablest critics, agree that they are the Scilly Islands, and the western extremity of Cornwall. After the destruction of Carthage, the British tin trade, which was always reckoned of peculiar importance, was carried on by the merchants of Marseilles, and subsequently by the Romans. Besides Britain, Spain furnished the ancients with considerable quantities of tin. We have no very precise information as to the purposes to which they applied this metal. It has been supposed that the Phœnicians, so famous for their purple dyes, were acquainted with the use of the solution of tin in nitro-muriatic acid in fixing that color. The best of the ancient mirrors, or *specula*, were also made of a mixture of copper and tin; and tin was used in the coating of copper vessels. —Watson's *Chemical Essays*.

In modern times, the tin mines of Cornwall and Devon have been wrought with various degrees of energy and success. Queen Elizabeth brought over some German miners, by whom some of the processes were improved. During the civil wars the mines were much neglected. At the commencement of last century, however, the business of mining was carried on with renewed vigor; and from 1720 to 1740 the annual produce was about 2100 tons. The produce went on gradually increasing, till it amounted, in the ten years from 1790 to 1800, to 3254 tons a year. During the next fifteen years the produce fell off; and for the five years ending with 1815 it was always considerably under 3000 tons a year. But in the last-mentioned year a considerable increase took place; and since 1816 the produce has been, with the exception of 1820, always above 3000 tons a year. The average produce of the mines in the year 1843 was estimated at above 5000 tons a year.

Tin, Oriental (Malay, *Timá*; Hind. *Kalai*; Siamese, *Dibuk*; Burmese, *Kye-p'kyu*, white copper), in *Commercial language* usually called Banca tin. It is found in several provinces of China; but the most extensive, and probably richest tin district in the world, exists in the Malay countries. This comprehends the whole of the peninsula, from the extreme cape to the latitude of 14° on its western side, and to 11° on its eastern, and comprehends several of the small islands lying in the route between the peninsula and Java, as far as the latitude of 8° south; so that the whole of this tin district has an extreme length of near 1200 miles. By far the greater number of the mines within these limits are as yet unwrought and unexplored. It was only in the beginning of last century that the mines of Banca, the most productive at present worked, were accidentally discovered. The whole tin of the Malay countries is the produce of alluvial ores, or what is called in Cornwall "Stream-work;" and from the abundance in which the mineral has been found by the mere washing of the soil, no attempt has hitherto been made at regular mining, or obtaining the ore from its rocky matrix. Malay tin, consequently, is grain tin, or tin in a very pure state; that being the species which alluvial ore uniformly produces. The mines, or rather excavations, are perpendicular pits of from 15 to 25 feet deep; and when the soil and a superstratum of common clay are removed, the bed containing the ore, consisting of quartz and granitic gravel, is reached. The sand and gravel are separated from the ore by passing a stream of water through the whole materials. The ore so obtained is preserved in heaps, and smelted periodically with charcoal in a blast furnace. The mine or pit is kept clear of water by the Chinese wheel. No cattle are used in any part of the process, human labor being had recourse to throughout the whole of its stages. The most imperfect part of the process is the smelting. The stream ores of Cornwall, which are generally poor, afford from 65 to 75 per cent. of grain tin; whereas, owing to the imperfection of the process, from those of Banca not more than 55 or 60 are usually obtained. The difference in the produce suggested, a few years ago, the practicability of sending the ore to England for the purpose of being smelted; and the experiment was tried; but our customs regulations not allowing the produce to be bonded and re-exported without duty, rendered the scheme abortive.

With very trifling exceptions, the whole tin of the Malay islands is mined and smelted by Chinese settlers; and before their skill and enterprise were applied to its production, the metal seems to have been obtained by the inhabitants of the countries which produced it, by processes hardly more skillful than those by which the precious metals were procured by the native inhabitants of America prior to the introduction of European skill and machinery. The following estimate has been given of the annual produce of the principal states and places producing tin:

East Coast of the Malay Peninsula.

	Piculs.
Junk Ceylon	5,000
Queda	2,000
Pera	3,000
Salangore	3,000
Malacca	4,000
Total piculs	17,000

West Coast of the Malay Peninsula and Islands.

	Piculs.
Sungora and Patani	3,000
Tringanu	7,000
Pahang	3,000
Singkep	6,000
Banca	35,000
Total piculs	53,000

This can be considered only as a rough estimate; but we believe it is not far wide of the truth. The most considerable port of exportation is Batavia; from which there is sent annually, either directly or through orders from the Dutch government or the authorities at Banca, 2000 tons. From Prince of Wales Island there is also a considerable quantity exported; and a smaller one direct to China in junks, from several of the native ports on the eastern shore of the Malay peninsula. The great marts for the consumption of tin are China, Hindostan, and the continent of Europe. The quality of the different descriptions of Malay tin, although there may be some inconsiderable difference in the quality of the original ores, seems to be derived chiefly from the greater or less skill with which the process of smelting is conducted; and this, again, necessarily depends upon the extent of capital and goodness of the machinery employed. The mining operations of Banca have long been conducted upon a larger scale, and with more skill, than in any other of the Malay countries; and, consequently, the metal produced in this island is superior by from 10 to 12 per cent.: in the market of Canton it is called "old tin," in contradistinction to "new tin," the produce of the other Malay countries. Next, in point of quality, to the produce of Banca, are those of Tringanu and Singkep, which are not more than 5 per cent. inferior to it. The tin of the state of Pera, a considerable part of which is produced by the natives themselves, without Chinese assistance, is the worst, and usually about 15 per cent. below that of Banca. The native tin of China is 10 per cent inferior to that of Banca, and is probably block-tin, like the greater part of that of Cornwall; and, like it, the produce of regular mining operations, and not alluvial. The produce of the Chinese mines is said of late years to have greatly decreased; probably owing to the great increase which has recently taken place in the produce of the Malay countries, and the cheapness and abundance with which

it finds its way to China. It should be added, that of late years, and chiefly owing to the very low price and abundance of German spelter (zinc) in the Indian market, this commodity has occasionally been fraudulently mixed with tin. The Chinese brokers of Canton, however, are sufficiently expert to detect the adulteration; and it is believed that this discreditable practice has lately ceased. The price of tin, taking the market of Singapore as the standard, has fluctuated of late years from 14 to 20 Spanish dollars per picul; equal, at the exchange of 4*s.* per dollar, to 47*s.* and 67*s.* per cwt. At an average of these prices, the annual value of the whole Malay tin will be about £240,000 per annum.—CRAWFURD's *History of the Indian Archipelago;* Dr. HORSFIELD's *MS. Statistical View of the Island of Banca; Singapore Chronicle; Canton Register*, etc.

EXPORTS OF DOMESTIC TIN FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Tithes are the tenth part of the increase yearly arising and renewing from the profits of lands, the stock upon lands, and the personal industry of the inhabitants, and are offerings payable to the Church by law. Under the Jewish system, the tenth part of the yearly increase of their goods was due to the priests. —*Numbers*, xviii. 21; *Deut.*, xiv. 22; *Levit.*, xxvii. 30, 32.

In the earliest ages of the Christian Church, offerings were made by its members at the altar, at collections, and in other ways; and such payments were enjoined by decrees of the Church, and sanctioned by general usage. For many centuries, however, they were voluntary. But when the Church had increased in power, and began to number among its members many who adhered to it because it was the prevailing religion, it was found necessary to enforce certain fixed contributions for the support of the ministers of religion. The Church relied upon the example of the Jews, and claimed a tenth. Meanwhile, the conversion of temporal princes to Christianity, and their zeal in favor of their new faith, enabled the Church to obtain the enactment of laws to compel the payment of tithes. In England, the first instance of a law for the offering of tithes was that of Offa, King of Mercia, toward the end of the 8th century. He first gave the Church a civil right in tithes, and enabled the clergy to recover them as their legal due. The law of Offa was at a later period extended to the whole of England by King Ethelwulph.—PRIDEAUX *on Tithes;* BOHN's *Cyclopedia.*

Tobacco (Da. *Tobak;* Du. *Tabak;* Fr. *Tabac;* Ger. *Taback;* It. *Tabacco;* Pol. *Tobaka;* Russ. *Tzbak;* Sp. *Tabaco;* Arab. *Bujjerbhang;* Hind. *Tumbākū;* Malay, *Tambrâcoo*), the dried leaves of the *Nicotiana tabacum*, a plant indigenous to America, but which succeeds very well, and is extensively cultivated in most parts of the Old World. The recent leaves possess very little odor or taste; but when dried, their odor is strong, narcotic, and somewhat fetid; their taste bitter and extremely acrid. When well cured, they are of a yellowish green color. When distilled, they yield an essential oil, on which their virtue depends, and which is said to be a virulent poison. The leaves are used in various ways; being chewed, smoked, and ground and manufactured into snuff. It is in the last mentioned form that tobacco is principally used in Great Britain; and though the contrary has been often asserted, its use does not seem to be productive of any perceptible bad consequence.

Historical Sketch.—The taste for tobacco, though apparently administering only to a frivolous gratification, has given birth to a most extensive commerce, and been a powerful spur to industry. Being a native of the New World, its introduction into Europe dates only from the early part of the 16th century. Seeds of the plant were sent, in 1560, from Portugal to Catherine de' Medici, by Jean Nicot, the French embassador in that country, from whom it has received its botanical name. The notion, at one time so general, that the specific appellation tobacco was derived from its having been imported from Tobago, is now universally admitted to be without foundation. Humboldt has shown that tobacco was the term used in the Haytian language to designate the pipe, or instrument made use of by the natives in smoking the herb; and the term, having been transferred by the Spaniards from the pipe to the herb itself, has been adopted by the other nations of the ancient world.—*Essai Politique sur la Nouvelle Espagne*, vol. iii. p. 50, 2d. ed. Tobacco is believed to have been first introduced into England by the settlers who returned, in 1586, from the colony which it had been attempted to found in Virginia, under the auspices of Sir Walter Raleigh, in the preceding year. Harriott, who accompanied this expedition, gives, in his description of Virginia, an account of the tobacco plant, and of the manner in which it was used by the natives; adding, that the English, during the time they were in Virginia, and since their return home, were accustomed to smoke it after the fashion of the Indians, "and found many rare and wonderful experiments of the virtue thereof."—HAKLUYT, vol. i. p. 75. Raleigh, and other young men of fashion, having adopted the practice of smoking, it spread among the English; as it had previously spread among the Spaniards, Portuguese, French, and other continental nations. But it made its greatest progress in England after the foundation of the colony at Jamestown, in Virginia, in 1607. The soil of the colony being found particularly well fitted for the culture of tobacco, considerable quantities were raised and sent

home; and the numerous individuals interested in the colony contributed to introduce that taste for it which was diffused among all classes with astonishing rapidity. James I. attempted, by repeated proclamations and publications, some of them couched in very strong terms, to restrain the use of tobacco. But his efforts had very little effect; and the settlers in Virginia continued to experience a more rapidly increasing and better demand for tobacco than for any other product of the colony. During the earlier part of the reign of Charles I., the trade in tobacco was monopolized by the crown. This monopoly was not, however, of long continuance, and totally ceased at the breaking out of the civil war.

Tobacco plants had been early introduced into England, and were found to answer remarkably well. Their cultivation was, indeed, prohibited by James, and afterward by Charles, but apparently without effect. At length, however, the growing consumption of tobacco having excited the attention of the government financiers, it was seen that, by imposing a duty on its importation, a considerable revenue might be raised; but that, were it allowed to be freely cultivated at home, it would be very difficult to collect a duty upon it. In 1643 the Lords and Commons imposed a moderate duty, for the sake of revenue, on plantation tobacco; but instead of directly prohibiting the use of native tobacco, they burdened it with such a duty as, it was supposed, would occasion its culture to be abandoned. The facility, however, with which the duty was evaded soon satisfied the republican leaders that more vigorous measures were required to stop its cultivation, and consequently to render its importation a source of revenue. Hence, in 1652, an act was passed prohibiting the growth of tobacco in England, and appointing commissioners to see its provisions carried into effect. This act was confirmed at the Restoration, by the act Charles II., c. 34, which ordered that all tobacco plantations should be destroyed. These measures were believed at the time to have been principally brought about by the solicitations of the planters; but their real intention was not so much to conciliate or benefit the latter, as to facilitate the collection of a revenue from tobacco; and, considered in this point of view, their policy seems quite unexceptionable.

Nicotiana Tabacum.—It is thought by some that this plant received its name from Tabacco, a province of Yucatan, New Spain; others say from the island of Tobago, one of the Caribbees; and others that it is derived from Tobasco, in the Gulf of Florida. It was first observed at San Domingo, A.D. 1496; and was used freely by the Spaniards in Yucatan in 1520. Tobacco was first carried to England in the seventh year of Elizabeth, 1565, by Sir John Hawkins; but Sir Walter Raleigh and Sir Francis Drake are also mentioned as having first introduced it in England. According to *Stowe's Chronicle*, it was manufactured only for exportation for some years. The Pied Bull Inn, at Islington, was the first house in England where tobacco was smoked. In 1584 a proclamation of the English government was issued against it. The Star Chamber ordered the duties to be 6*s.* 10*d.* per lb., in the year 1614. Its cultivation was prohibited in England by Charles II. The act laying a specific duty on the importation into England was passed 1684. The cultivation was allowed in Ireland about the year 1779. In *Anderson's History of Commerce* we find that the tax was increased, and put under the excise in 1789. Various statutes have been passed by the English government relative to tobacco. The act to revive the act prohibiting the culture of tobacco in Ireland passed 2 William IV. (August, 1831). The act directing that tobacco grown in Ireland be purchased in order to its being destroyed, March 24, 1832. The quantity consumed in England in 1791 was 9,500,000 lbs., and in 1829 about 15,000,000 lbs. In 1840 the quantity had reached to 40,000,000 lbs. In 1854 the quantity imported into Great Britain was about 35,000,000 lbs., of which 2,710,000 lbs. were manufactured as cigars or snuff, and the rest unmanufactured. —HAYDN.

In some countries tobacco is principally, perhaps, used in the form of snuff; in others it is principally chewed, or again smoked; but, in one form or another, it is every where made use of. So early as 1624, Pope Urban VIII. issued a bull excommunicating those who smoked in churches! The practice of smoking was at one time exceedingly prevalent in England; but during the reign of George III. it was well-nigh superseded, at least among the higher and middle classes, by the practice of snuff-taking. Latterly, however, smoking has been extensively revived among both the rich and the poor.

We quote the following statement as to the universality of the use of tobacco from a learned paper on its "Introduction and Use," in the 22d volume (p. 142) of the *Asiatic Journal:* "In Spain, France, and Germany, in Holland, Sweden, Denmark, and Russia, the practice of smoking tobacco prevails among the rich and poor, the learned and the gay. In the United States smoking is often carried to excess. If we pass to the East, we shall find the practice almost universal. In Turkey the pipe is perpetually in the mouth; and the most solemn conferences are generally concluded with a friendly pipe, employed like the *calumet of peace* among the Indians. In the East Indies not merely all classes, but both sexes, inhale the fragrant steam; the only distinction among them consisting in the shape of the instrument employed, and the species of the herb smoked. In China the habit equally prevails; and a modern traveler in that country (Barrow) states, that every Chinese female, from the age of eight or nine years, wears, as an appendage to her dress, a small silken purse or pocket to hold tobacco and a pipe, with the use of which many of them are not unacquainted at this tender age. This prevalence of the practice at an early period among the Chinese is appealed to by M. Pallas as an evidence that 'in Asia, and especially in China, the use of tobacco for smoking is more ancient than the discovery of the New World.' He adds: 'Among the Chinese, and among the Mongol tribes who had the most intercourse with them, the custom of smoking is so general, so frequent, and has become so indispensable a luxury; the tobacco purse affixed to their belt so necessary an article of dress; the form of the pipes, from which the Dutch seem to have taken the model of theirs, so original; and, lastly, the preparation of the yellow leaves, which are merely rubbed to pieces and then put into the pipe, so peculiar, that they could not possibly derive all this from America by way of Europe; especially as India, where the practice of smoking is not so general, intervenes between Persia and China.'" This, however, is a very doubtful proposition. It seems sufficiently established that the tobacco plant was first brought from Central America (see date of introduction of tobacco), and it is most probable that it was thence carried to Siam, China, and other Eastern countries. The names given to it in all the languages of the East are obviously of European, or rather American, origin; a fact which seems completely to negative the idea of its being indigenous to the East.

Tobacco is extensively cultivated in Mexico, but only for home consumption. It might probably, however, were it not for the restrictions under which it is placed, form a considerable article of export from that country. Under the Spanish government, the tobacco monopoly was one of the principal sources of revenue; yielding from 4,000,000 to 4,500,000 dollars, exclusive of the expenses of administration, amounting to about 800,000 dollars. No tobacco was allowed to be cultivated, except in a few specified places. Commissioners, or *guardas de tabaco*, were appointed, whose duty

it was to take care that all tobacco plantations without the privileged districts should be destroyed. The government fixed the price at which the cultivators of tobacco were obliged to sell it to its agents. The sale of the manufactured tobacco was farmed out; and *cigars* were not allowed to be sold, except at the royal *estancos*. No one was allowed to use cigars of his own manufacture. This oppressive monopoly was established in 1764. It has been continued, from the difficulty of supplying the revenue which it produces, by the revolutionary governments.—HUMBOLDT, *Nouvelle Espagne*, iii. 49; POINSETT's *Notes on Mexico*, note 116, London ed.

Cuba is celebrated for its tobacco, particularly its cigars. These consist of the leaves, formed into small rolls, for the purpose of smoking. Formerly their importation into England was prohibited; but they may now be imported on paying an exorbitant duty. Havana cigars are usually reckoned the best. Previously to 1817, the cultivation and sale of tobacco were subjected to the same restrictions as in Cuba as in Mexico; but at the period mentioned the trade was thrown open. In consequence of the freedom thus given to the business, the production and exportation of tobacco are both rapidly increasing, though hardly, perhaps, so much as might have been expected, the culture of sugar and coffee being for a while reckoned more profitable; that, however, is no longer the case. —*See* CUBA for Exports.

United States.—Previous to the war of Independence, its culture had spread into Maryland, Carolina, Georgia, and Louisiana, from which nearly all Europe was supplied; but at present most of the sovereigns of the Old World derive a considerable part of their revenue from the cultivation of this plant. Independent of its production in the Middle and Southern States of the Union, tobacco is extensively cultivated in Mexico, the Spanish Main, Cuba, Brazil, Trinidad, San Domingo, Turkey, Persia, India, China, Australia, the Phillippines, and Japan. It has also been raised with success in nearly every country in Europe, Egypt, Algeria, the Cape of Good Hope, the Canaries, and numerous other islands in the ocean, Canada, New Brunswick, and on the western coast of America. The principal varieties cultivated in the United States are the Virginian, the large-leaved, the dwarf, the Cuba, and the common green tobacco.
